The NASA STI Program ... in Profile

Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA Scientific and Technical Information (STI) Program plays a key part in helping NASA maintain this important role.

The NASA STI Program provides access to the NASA STI Database, the largest collection of aeronautical and space science STI in the world. The Program is also NASA's institutional mechanism for disseminating the results of its research and development activities.

Specialized services that help round out the Program's diverse offerings include creating custom thesauri, translating material to or from 34 foreign languages, building customized databases, organizing and publishing research results, ...even producing videos.

For more information about the NASA STI Program, you can:

- **Phone** the NASA Access Help Desk at (301) 621-0390
- **Fax** your question to the NASA Access Help Desk at (301) 621-0134
- **E-mail** your question via the **Internet** to help@sti.nasa.gov
- **Write** to

Scientific and Technical Aerospace Reports

Scientific and Technical Aerospace Reports (STAR), is published each month as a major product of the International Aerospace Database, managed by the NASA Scientific and Technical Information (STI) Program.

Inside this issue you will find:

Front Matter
A typical citation and abstract sample explaining the standard format, which includes codes for ordering reports.

An Abstract Section
Citations and abstracts of reports and publications that provide comprehensive coverage of worldwide aerospace-related topics including aeronautics and space science technology. *STAR* lists published and publicly available reports entered into the NASA STI Database during the four weeks preceding publication of this issue. These citations and abstracts are listed by subject categories.

An Index Section
- Subject
- Personal author
- Corporate source
- Contract number
- Report number.

Appendix
A guide for ordering cited reports, registering with the NASA STI Program, and using the available products and services. Additionally, price schedules, phone numbers, and addresses are included in this information packed section.

NASA also sponsors companion journals, *International Aerospace Abstracts (IAA)*, and *NASA Open Volumes on Aerospace (NOVA)*. They list abstracts of the open literature on aerospace subjects available worldwide. IAA is available from the American Institute of Aeronautics and Astronautics (AIAA), and *NOVA* is for internal NASA use only, available from the NASA Center for AeroSpace Information (CASI).

Reports found in *STAR* are also available through the NASA online retrieval service, RECON, and the Aerospace Database through DIALOG.

The NASA STI Program gathers information through national and international agreements and exchanges and makes this information available to the NASA community and to the public in many forms through various outlets.

For additional information on the NASA STI Program, call the NASA Access Help Desk at (301) 621-0390, or write to:

TABLE OF CONTENTS

AERONAUTICS For related information see also *Astronautics.*

01 AERONAUTICS (GENERAL) **2105**

02 AERODYNAMICS **2107**
Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery. For related information see also *34 Fluid Mechanics and Heat Transfer.*

03 AIR TRANSPORTATION AND SAFETY **2116**
Includes passenger and cargo air transport operations; and aircraft accidents. For related information see also *16 Space Transportation* and *85 Urban Technology and Transportation.*

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION **2119**
Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control. For related information see also *17 Space Communications, Spacecraft Communications, Command and Tracking* and *32 Communications and Radar.*

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE **2125**
Includes aircraft simulation technology. For related information see also *18 Spacecraft Design, Testing and Performance* and *39 Structural Mechanics.* For land transportation vehicles see *85 Urban Technology and Transportation.*

06 AIRCRAFT INSTRUMENTATION **2128**
Includes cockpit and cabin display devices; and flight instruments. For related information see also *19 Space craft Instrumentation* and *35 Instrumentation and Photography.*

07 AIRCRAFT PROPULSION AND POWER **2129**
Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and onboard auxiliary power plants for aircraft. For related information see also *20 Spacecraft Propulsion and Power, 28 Propellants and Fuels,* and *44 Energy Production and Conversion.*

08 AIRCRAFT STABILITY AND CONTROL **2131**
Includes aircraft handling qualities; piloting; flight controls; and autopilots. For related information see also *05 Aircraft Design, Testing and Performance.*

09 RESEARCH AND SUPPORT FACILITIES (AIR) **2132**
Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tubes; and aircraft engine test stands. For related information see also *14 Ground Support Systems and Facilities (Space).*

ASTRONAUTICS For related information see also *Aeronautics.*

12 ASTRONAUTICS (GENERAL) **2135**
For extraterrestrial exploration see *91 Lunar and Planetary Exploration.*

13 ASTRODYNAMICS ..... **N.A.**
Includes powered and free-flight trajectories; and orbital and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) **2169**
Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators. For related information see also *09 Research and Support Facilities (Air).*

15 LAUNCH VEHICLES AND SPACE VEHICLES **2171**
Includes boosters; operating problems of launch/space vehicle systems; and reusable vehicles. For related information see also *20 Spacecraft Propulsion and Power.*

16 SPACE TRANSPORTATION **2172**
Includes passenger and cargo space transportation, e.g., shuttle operations; and space rescue techniques. For related information see also *03 Air Transportation and Safety* and *18 Spacecraft Design, Testing and Performance.* For space suits see *54 Man/System Technology and Life Support.*

17 SPACE COMMUNICATIONS, SPACECRAFT COMMUNICATIONS, COMMAND AND TRACKING . **2180**
Includes telemetry; space communications networks; astronavigation and guidance; and radio blackout. For related information see also *04 Aircraft Communications and Navigation* and *32 Communications and Radar.*

N.A.—no abstracts were assigned to this category for this issue.

18 SPACECRAFT DESIGN, TESTING AND PERFORMANCE **2181**
Includes satellites; space platforms; space stations; spacecraft systems and components such as thermal and environmental controls; and attitude controls. For life support systems see *54 Man/System Technology and Life Support.* For related information see also *05 Aircraft Design, Testing and Performance, 39 Structural Mechanics,* and *16 Space Transportation.*

19 SPACECRAFT INSTRUMENTATION **2199**
For related information see also *06 Aircraft Instrumentation* and *35 Instrumentation and Photography.*

20 SPACECRAFT PROPULSION AND POWER **2202**
Includes main propulsion systems and components, e.g., rocket engines; and spacecraft auxiliary power sources. For related information see also *07 Aircraft Propulsion and Power, 28 Propellants and Fuels, 44 Energy Production and Conversion,* and *15 Launch Vehicles and Space Vehicles.*

CHEMISTRY AND MATERIALS

23 CHEMISTRY AND MATERIALS (GENERAL) **2206**

24 COMPOSITE MATERIALS **2207**
Includes physical, chemical, and mechanical properties of laminates and other composite materials. For ceramic materials see *27 Nonmetallic Materials.*

25 INORGANIC AND PHYSICAL CHEMISTRY **2216**
Includes chemical analysis, e.g., chromatography; combustion theory; electrochemistry; and photochemistry. For related information see also *77 Thermodynamics and Statistical Physics.*

26 METALLIC MATERIALS **2226**
Includes physical, chemical, and mechanical properties of metals, e.g., corrosion; and metallurgy.

27 NONMETALLIC MATERIALS **2235**
Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials. For composite materials see *24 Composite Materials.*

28 PROPELLANTS AND FUELS **2244**
Includes rocket propellants, igniters and oxidizers; their storage and handling procedures; and aircraft fuels. For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power,* and *44 Energy Production and Conversion.*

29 MATERIALS PROCESSING **2246**
Includes space-based development of products and processes for commercial application. For biological materials see *55 Space Biology.*

ENGINEERING For related information see also *Physics.*

31 ENGINEERING (GENERAL) **2254**
Includes vacuum technology; control engineering; display engineering; cryogenics; and fire prevention.

32 COMMUNICATIONS AND RADAR **2260**
Includes radar; land and global communications; communications theory; and optical communications. For related information see also *04 Aircraft Communications and Navigation* and *17 Space Communications, Spacecraft Communications, Command and Tracking.* For search and rescue see *03 Air Transportation and Safety,* and *16 Space Transportation.*

33 ELECTRONICS AND ELECTRICAL ENGINEERING **2276**
Includes test equipment and maintainability; components, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuitry. For related information see also *60 Computer Operations and Hardware* and *76 Solid-State Physics.*

34 FLUID MECHANICS AND HEAT TRANSFER **2287**
Includes boundary layers; hydrodynamics; fluidics; mass transfer and ablation cooling. For related information see also *02 Aerodynamics* and *77 Thermodynamics and Statistical Physics.*

35 INSTRUMENTATION AND PHOTOGRAPHY **2302**
Includes remote sensors; measuring instruments and gauges; detectors; cameras and photographic supplies; and holography. For aerial photography see *43 Earth Resources and Remote Sensing.* For related information see also *06 Aircraft Instrumentation* and *19 Spacecraft Instrumentation.*

36 LASERS AND MASERS **2306**
Includes parametric amplifiers. For related information see also *76 Solid-State Physics.*

37 MECHANICAL ENGINEERING **2311**
Includes auxiliary systems (nonpower); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY **2321**
Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS **2322**
Includes structural element design and weight analysis; fatigue; and thermal stress. For applications see *05 Aircraft Design, Testing and Performance* and *18 Spacecraft Design, Testing and Performance.*

GEOSCIENCES For related information see also *Space Sciences.*

42 GEOSCIENCES (GENERAL) ..... **N.A.**

43 EARTH RESOURCES AND REMOTE SENSING **2334**
Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography. For instrumentation see *35 Instrumentation and Photography.*

44 ENERGY PRODUCTION AND CONVERSION **2375**
Includes specific energy conversion systems, e.g., fuel cells; global sources of energy; geophysical conversion; and windpower. For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power,* and *28 Propellants and Fuels.*

45 ENVIRONMENT POLLUTION **2383**
Includes atmospheric, noise, thermal, and water pollution.

46 GEOPHYSICS **2391**
Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism. For space radiation see *93 Space Radiation.*

47 METEOROLOGY AND CLIMATOLOGY **2402**
Includes weather forecasting and modification.

48 OCEANOGRAPHY **2412**
Includes biological, dynamic, and physical oceanography; and marine resources. For related information see also *43 Earth Resources and Remote Sensing.*

LIFE SCIENCES

51 LIFE SCIENCES (GENERAL) **2417**

52 AEROSPACE MEDICINE **2420**
Includes physiological factors; biological effects of radiation; and effects of weightlessness on man and animals.

53 BEHAVIORAL SCIENCES **2424**
Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT **2426**
Includes human engineering; biotechnology; and space suits and protective clothing. For related information see also *16 Space Transportation.*

55 SPACE BIOLOGY ..... **N.A.**
Includes exobiology; planetary biology; and extraterrestrial life.

MATHEMATICAL AND COMPUTER SCIENCES

59 MATHEMATICAL AND COMPUTER SCIENCES (GENERAL) **2430**

60 COMPUTER OPERATIONS AND HARDWARE **2432**
Includes hardware for computer graphics, firmware, and data processing. For components see *33 Electronics and Electrical Engineering.*

61 COMPUTER PROGRAMMING AND SOFTWARE **2434**
Includes computer programs, routines, algorithms, and specific applications, e.g., CAD/CAM.

62 COMPUTER SYSTEMS **2445**
Includes computer networks and special application computer systems.

63 CYBERNETICS **2449**
Includes feedback and control theory, artificial intelligence, robotics and expert systems. For related information see also *54 Man/System Technology and Life Support.*

64 NUMERICAL ANALYSIS **2466**
Includes iteration, difference equations, and numerical approximation.

65 STATISTICS AND PROBABILITY **2471**
Includes data sampling and smoothing; Monte Carlo method; and stochastic processes.

66 SYSTEMS ANALYSIS **2473**
Includes mathematical modeling; network analysis; and operations research.

67 THEORETICAL MATHEMATICS **2474**
Includes topology and number theory.

PHYSICS For related information see also *Engineering.*

70 PHYSICS (GENERAL) **2474**
For precision time and time interval (PTTI) see *35 Instrumentation and Photography;* for geophysics, astrophysics or solar physics see *46 Geophysics, 90 Astrophysics,* or *92 Solar Physics.*

71 ACOUSTICS **2476**
Includes sound generation, transmission, and attenuation. For noise pollution see *45 Environment Pollution.*

72 ATOMIC AND MOLECULAR PHYSICS **2478**
Includes atomic structure, electron properties, and molecular spectra.

73 NUCLEAR AND HIGH-ENERGY PHYSICS **2485**
Includes elementary and nuclear particles; and reactor theory. For space radiation see *93 Space Radiation.*

74 OPTICS **2486**
Includes light phenomena and optical devices. For lasers see *36 Lasers and Masers.*

75 PLASMA PHYSICS **2491**
Includes magnetohydrodynamics and plasma fusion. For ionospheric plasmas see *46 Geophysics.* For space plasmas see *90 Astrophysics.*

76 SOLID-STATE PHYSICS **2499**
Includes superconductivity. For related information see also *33 Electronics and Electrical Engineering* and *36 Lasers and Masers.*

77 THERMODYNAMICS AND STATISTICAL PHYSICS **2514**
Includes quantum mechanics; theoretical physics; and Bose and Fermi statistics. For related information see also *25 Inorganic and Physical Chemistry* and *34 Fluid Mechanics and Heat Transfer.*

SOCIAL SCIENCES

80 SOCIAL SCIENCES (GENERAL) **2516**
Includes educational matters.

81 ADMINISTRATION AND MANAGEMENT **2518**
Includes management planning and research.

82 DOCUMENTATION AND INFORMATION SCIENCE **2522**
Includes information management; information storage and retrieval technology; technical writing; graphic arts; and micrography. For computer documentation see *61 Computer Programming and Software.*

83 ECONOMICS AND COST ANALYSIS **2531**
Includes cost effectiveness studies.

84 LAW, POLITICAL SCIENCE AND SPACE POLICY **2532**
Includes NASA appropriation hearings; aviation law; space law and policy; international law; international cooperation; and patent policy.

85 URBAN TECHNOLOGY AND TRANSPORTATION **2532**
Includes applications of space technology to urban problems; technology transfer; technology assessment; and surface and mass transportation. For related information see *03 Air Transportation and Safety, 16 Space Transportation,* and *44 Energy Production and Conversion.*

SPACE SCIENCES For related information see also *Geosciences.*

88 SPACE SCIENCES (GENERAL) **2533**

89 ASTRONOMY **2541**
Includes radio, gamma-ray, and infrared astronomy; and astrometry.

90 ASTROPHYSICS **2546**
Includes cosmology; celestial mechanics; space plasmas; and interstellar and interplanetary gases and dust. For related information see also *75 Plasma Physics.*

91 LUNAR AND PLANETARY EXPLORATION **2553**
Includes planetology; and manned and unmanned flights. For spacecraft design or space stations see *18 Spacecraft Design, Testing and Performance.*

92 SOLAR PHYSICS **2555**
Includes solar activity, solar flares, solar radiation and sunspots. For related information see *93 Space Radiation.*

93 SPACE RADIATION **2559**
Includes cosmic radiation; and inner and outer earth's radiation belts. For biological effects of radiation see *52 Aerospace Medicine.* For theory see *73 Nuclear and High-Energy Physics.*

GENERAL

Includes aeronautical, astronautical, and space science related histories, biographies, and pertinent reports too broad for categorization; histories or broad overviews of NASA programs.

AN EXPERT SYSTEM FOR THE DIAGNOSTIC AND MAINTENANCE OF VARIOUS AIRCRAFT COMPONENTS [EXPERTENSYSTEM FUER DIE DIAGNOSE UND WARTUNG UNTERSCHIEDLICHER KOMPONENTEN DES FLUGZEUGES]

Juergen Fey Sep. 1989 13 p In GERMAN Presented at DGLR e.V. Forschungsintitut fuer Anthropotechnik der FGAN e.V. 32nd Fachausschusssitzung, Ottobrunn, Germany, 19-20 Sep. 1989 Submitted for publication

(MBB-FE-363-S-PUB-0499; ETN-93-93438) Avail: CASI HC A03/MF A01

Maintenance costs are increasing in relation with the increasing complexity of avionic systems. The use of knowledge based systems is considered for airborne and ground based test techniques, in order to meet with the resulting requirements. A ground based diagnostic system is developed, which can give guidance to the maintenance engineer at debriefing, on a necessary checkout of avionic components on special testing bench. It can avoid suppposedly defective modules being unnecessarily replaced and expensive test procedures being undertaken. ESA

REPORT TO THE CHAIRMAN, SUBCOMMITTEE ON DEFENSE, COMMITTEE ON APPROPRIATIONS, HOUSE OF REPRESENTATIVES. INTELLIGENCE PROGRAMS: NEW RC-135 AIRCRAFT ENGINES CAN REDUCE COST AND IMPROVE PERFORMANCE

Aug. 1992 8 p

(AD-A259283; GAO/NSIAD-92-305) Avail: CASI HC A02/MF A01

In response to a request, information on the replacement of engines for the Department of Defense's fleet of 21 RC-135 aircraft are provided to the Subcommittee on Defense. This report addresses: (1) the estimated cost to replace the RC-135 aircraft's TF-33 engines; (2) the projected savings in future opearation and maintenance costs by replacing the engines; and (3) the operational benefits resulting from engine replacement. JOINT UNIVERSITY PROGRAM FOR AIR TRANSPORTATION RESEARCH, 1991-1992

Frederick R. Morrell, comp. Washington Feb. 1993 169 p Conference held in Athens, OH, 18-19 Jun. 1992; sponsored by NASA, Washington and FAA

(Grants NGL-22-009-640; NGL-31-001-252; NGR-36-009-017; RTOP 505-64-52-01)

(NASA-CP-3193; L-17195; NAS 1.55:3193) Avail: CASI HC A08/MF A02

This report summarizes the research conducted during the academic year 1991-1992 under the FAA/NASA sponsored Joint University Program for Air Transportation Research. The year end review was held at Ohio University, Athens, Ohio, June 18-19, 1992. The Joint University Program is a coordinated set of three grants sponsored by the Federal Aviation Administration and NASA Langley Research Center, one each with the Massachusetts Institute of Technology (NGL-22-009-640), Ohio University (NGR-36-009-017), and Princeton University (NGL-31-001-252). Completed works, status reports, and annotated bibliographies are presented for research topics, which include navigation, guidance and control theory and practice, intelligent flight control, flight dynamics, human factors, and air traffic control processes. An overview of the year's activities for each university is also presented. For individual titles, see N93-22562 through N93-22576.

AN INVESTIGATION OF AIR TRANSPORTATION TECHNOLOGY AT THE MASSACHUSETTS INSTITUTE OF TECHNOLOGY, 1991-1992 **c03**

Robert W. Simpson *In* NASA. Langley Research Center, Joint University Program for Air Transportation Research, 1991-1992 Feb. 1993 p 3-7 (For primary document see N93-22561 08-01)

Avail: CASI HC A01/MF A02

There are two completed projects and five new or continuing research activities under the sponsorship of the FAA/NASA Joint University Program as the 1991-92 period ends. A brief summary of some of the continuing research projects is provided. The active research projects are: (1) extensions for the FASA (Final Approach Spacing Advisory) System; (2) radar tracking around a turn; (3) impact of advanced technologies of single pilot IFR operations; (4) system and human limitations in millimeter wave and infrared synthetic vision systems; and (5) differences in party line information usage by operational user groups. Derived from text

THE ASLOTS CONCEPT: AN INTERACTIVE, ADAPTIVE DECISION SUPPORT CONCEPT FOR FINAL APPROACH SPACING OF AIRCRAFT (FASA). FAA-NASA JOINT UNIVERSITY PROGRAM **c04**

Robert W. Simpson *In* NASA. Langley Research Center, Joint University Program for Air Transportation Research, 1991-1992 Feb. 1993 p 9-20 (For primary document see N93-22561 08-01)

Avail: CASI HC A03/MF A02

This presentation outlines a concept for an adaptive, interactive decision support system to assist controllers at a busy airport in achieving efficient use of multiple runways. The concept is being implemented as a computer code called FASA (Final Approach Spacing for Aircraft), and will be tested and demonstrated in ATCSIM, a high fidelity simulation of terminal area airspace and airport surface operations. Objectives are: (1) to provide automated cues to assist controllers in the sequencing and spacing of landing and takeoff aircraft; (2) to provide the controller with a limited ability to modify the sequence and spacings between aircraft, and to insert takeoffs and missed approach aircraft in the landing flows; (3) to increase spacing accuracy using more complex and precise separation criteria while reducing controller workload; and (4) achieve higher operational takeoff and landing rates on multiple runways in poor visibility. HAZARD EVALUATION AND OPERATIONAL COCKPIT DISPLAY OF GROUND-MEASURED WINDSHEAR DATA **c03**

Craig Wanke and R. John Hansman, Jr. *In* NASA. Langley Research Center, Joint University Program for Air Transportation Research, 1991-1992 Feb. 1993 p 21-27 Presented at the AIAA 28th Aerospace Sciences Meeting, Reno, NV, 8-11 Jan. 1990 Previously announced in IAA as A90-19919 and A92-41216 (For primary document see N93-22561

08-01)
(Grants NAG1-690; NGL-22-009-640)
(AIAA Paper 90-0566) Avail: CASI HC A02/MF A02

Low-altitude windshear is the leading weather-related cause of fatal aviation accidents in the U.S. Since 1964, there have been 26 accidents attributed to windshear resulting in over 500 fatalities. Low-altitude windshear can take several forms, including macroscopic forms such as cold-warm gustfronts down to the small, intense downdrafts known as microbursts. Microbursts are particularly dangerous and difficult to detect due to their small size, short duration, and occurrence under both heavy precipitation and virtually dry conditions. For these reasons, the real-time detection of windshear hazards is a very active field of research. Also, the advent of digital ground-to-air datalinks and electronic flight instrumentation opens up many options for implementation of windshear alerts in the terminal area environment. Study is required to determine the best content, format, timing, and cockpit presentation of windshear alerts in the modern ATC environment to best inform the flight crew without significantly increasing crew workload. HEAT TRANSFER ON ACCRETING ICE SURFACES **c03**
Keiko Yamaguchi and R. John Hansman, Jr. *In* NASA. Langley Research Center, Joint University Program for Air Transportation Research, 1991-1992 Feb. 1993 p 29-34 Presented at the AIAA 28th Aerospace Sciences Meeting, Reno, NV, 8-11 Jan. 1990 Previously announced in IAA as A90-22181 and A92-24415 Sponsored in part by NSF (For primary document see N93-22561 08-01)
(Grants NAG3-666; NGL-22-009-640)
(AIAA Paper 90-0200) Avail: CASI HC A02/MF A02

Based on previous observations of glaze ice accretion on aircraft surfaces, a multizone model with distinct zones of different surface roughness is demonstrated. The use of surface roughness in the LEWICE ice accretion prediction code is examined. It was found that roughness is used in two ways: (1) to determine the laminar to turbulent boundary-layer transition location; and (2) to calculate the convective turbulent heat-transfer coefficient. A two-zone version of the multizone model is implemented in the LEWICE code, and compared with experimental convective heat-transfer coefficient and ice accretion results. The analysis of the boundary-layer transition, surface roughness, and viscous flowfield effects significantly increased the accuracy in predicting heat-transfer coefficients. The multizone model was found to significantly improve the ice accretion prediction for the cases compared. Author

HAZARD ALERTING AND SITUATIONAL AWARENESS IN ADVANCED AIR TRANSPORT COCKPITS **c03**
R. John Hansman, Craig Wanke, James Kuchar, Mark Mykityshyn, Edward Hahn, and Alan Midkiff *In* NASA. Langley Research Center, Joint University Program for Air Transportation Research, 1991-1992 Feb. 1993 p 35-45 Previously announced in IAA as A93-14377 (For primary document see N93-22561 08-01)
(Contract NAG2-12; NAG2-716; NAG1-690; NGL-22-009-640; DTRS-57-88-C-00078; NSF MSS-05-52702)
Avail: CASI HC A03/MF A02

Advances in avionics and display technology have significantly changed the cockpit environment in current 'glass cockpit' aircraft. Recent developments in display technology, on-board processing, data storage, and datalinked communications are likely to further alter the environment in second and third generation 'glass cockpit' aircraft. The interaction of advanced cockpit technology with human cognitive performance has been a major area of activity within the MIT Aeronautical Systems Laboratory. This paper presents an overview of the MIT Advanced Cockpit Simulation Facility. Several recent research projects are briefly reviewed and the most important results are summarized. Author

N93-22567*# Ohio Univ., Athens.
A HYBRID VOICE/DATA MODULATION FOR THE VHF AERONAUTICAL CHANNELS **c32**
Dennis M. Akos *In* NASA. Langley Research Center, Joint University Program for Air Transportation Research, 1991-1992 Feb. 1993 p 53-65 (For primary document see N93-22561 08-01)
Avail: CASI HC A03/MF A02

A method of improving the spectral efficiency of the existing Very High Frequency (VHF) Amplitude Modulation (AM) voice communication channels is proposed. The technique is to phase modulate the existing voice amplitude modulated carrier with digital data. This allows the transmission of digital information over an existing AM voice channel with no change to the existing AM signal format. There is no modification to the existing AM receiver to demodulate the voice signal and an additional receiver module can be added for processing of the digital data. The existing VHF AM transmitter requires only a slight modification for the addition of the digital data signal. The past work in the area is summarized and presented together with an improved system design and the proposed implementation. Author

N93-22568*# Ohio Univ., Athens.
FAULT DETECTION AND ISOLATION **c04**
Greg Bernath *In* NASA. Langley Research Center, Joint University Program for Air Transportation Research, 1991-1992 Feb. 1993 p 67-76 (For primary document see N93-22561 08-01)
Avail: CASI HC A02/MF A02

Erroneous measurements in multisensor navigation systems must be detected and isolated. A recursive estimator can find fast growing errors; a least squares batch estimator can find slow growing errors. This process is called fault detection. A protection radius can be calculated as a function of time for a given location. This protection radius can be used to guarantee the integrity of the navigation data. Fault isolation can be accomplished using either a snapshot method or by examining the history of the fault detection statistics. Author

N93-22569*# Ohio Univ., Athens.
GPS MULTIPATH ERRORS IN THE PRECISION LANDING ENVIRONMENT **c04**
James D. Waid *In* NASA. Langley Research Center, Joint University Program for Air Transportation Research, 1991-1992 Feb. 1993 p 77-88 (For primary document see N93-22561 08-01)
(Grants NAG1-1423; NGR-36-009-017)
Avail: CASI HC A03/MF A02

Aircraft guidance and positioning during the final approach and landing phases of flight requires a high degree of accuracy. The Global Positioning System operating in differential mode (DGPS) is being considered for this application. Prior to implementation, all sources of error must be considered. Multipath has been shown to be the dominant source of error for DGPS. Theoretical studies have verified the severity of multipath within the final approach and landing regions. This paper presents a study of GPS multipath errors during these critical phases of flight. A discussion of GPS multipath error characteristics will be presented along with actual multipath data. The data was collected using P-code and C/A-code receiver architectures. Data was collected onboard a dual-engine fixed-wing research aircraft. Aircraft dynamics are considered in the data analysis. INVESTIGATION OF AIR TRANSPORTATION TECHNOLOGY AT PRINCETON UNIVERSITY, 1991-1992 **c03**
Robert F. Stengel *In* NASA. Langley Research Center, Joint University Program for Air Transportation Research, 1991-1992 Feb. 1993 p 91-100 (For primary document see N93-22561 08-01)
Avail: CASI HC A02/MF A02

The Air Transportation Research Program at Princeton University proceeded along six avenues during the past year: (1) intelligent flight control; (2) computer-aided control system design; (3) neural networks for flight control; (4) stochastic robustness of flight control systems; (5) microburst hazards to aircraft; and (6) fundamental dynamics of atmospheric flight. This research has resulted in a number of publications, including archival papers and conference papers. An annotated bibliography of publications that appeared between June 1991 and June 1992 appears at the end of this report. The research that these papers describe was supported in whole or in part by the Joint University Program, including work that was completed prior to the reporting period. Author

ADVANCED AIR TRAFFIC MANAGEMENT **c04**
J. P. Wangermann *In* NASA. Langley Research Center, Joint University Program for Air Transportation Research, 1991-1992 Feb. 1993 p 101-106 (For primary document see N93-22561 08-01)
Avail: CASI HC A02/MF A02

Air traffic worldwide continues to grow, and this growth is predicted to continue in the coming decades. Air traffic management (ATM) systems in several parts of the world have now reached their operating limits. The external symptoms of this are increases in the number of delays experienced by the system, and a rise in the frequency of near-misses. If the ATM system fails to develop to provide more capacity, then the result will be a decrease in safety levels, and increasing delays, or a limit on the number of permitted aircraft operations. At the 1990 American Controls Conference a benchmark problem was issued as a challenge for designing robust compensators. Many compensators were presented in response to the problem. In previous work Stochastic Robustness Analysis (SRA) was used to compare these compensators. In this work SRA metrics are used as guides to synthesize robust compensators, using the benchmark problem as an example. Author

OPTIMAL RECOVERY FROM MICROBURST WIND SHEAR **c03**
Sandeep S. Mulgund *In* NASA. Langley Research Center, Joint University Program for Air Transportation Research, 1991-1992 Feb. 1993 p 129-140 (For primary document see N93-22561 08-01)
Avail: CASI HC A03/MF A02

Severe low-altitude wind variability represents an infrequent but significant hazard to aircraft taking off or landing. During the period from 1964 to 1985, microburst wind shear was a contributing factor in at least 26 civil aviation accidents involving nearly 500 fatalities and over 200 injuries. A microburst is a strong localized downdraft that strikes the ground, creating winds that diverge radially from the impact point. The physics of microbursts have only been recently understood in detail, and it has been found that effective recovery from inadvertent encounters may require piloting techniques that are counter-intuitive to flight crews. The goal of this work was to optimize the flight path of a twin-jet transport aircraft encountering a microburst during approach to landing. The objective was to execute an escape maneuver that maintained safe ground clearance and an adequate stall margin during the climb-out portion of the trajectory. Author

DYNAMIC RESPONSE AND CONTROL OF A JET-TRANSPORT AIRCRAFT ENCOUNTERING A SINGLE-AXIS VORTEX **c08**
Darin R. Spilman *In* NASA. Langley Research Center, Joint University Program for Air Transportation Research, 1991-1992 Feb. 1993 p 141-150 (For primary document see N93-22561 08-01)
Avail: CASI HC A02/MF A02

The dynamic responses of a jet-transport aircraft to two types of single-axis wind vortex encounters are studied. Aircraft attitude, flight path angle, and aerodynamic angle excursions are analyzed and dominating dynamic forcing effects are identified for each encounter. A simple departure-preventing LQR controller is designed to demonstrate the benefits of using automatic control to reduce the wind vortex hazard. A Proportional-Integral-Filter controller structure successfully regulates the critical parameters, roll angle, phi, and sideslip angle, beta, for the two different vortex encounters considered in this study. INTELLIGENT FLIGHT CONTROL SYSTEMS **c08**
Robert F. Stengel *In* NASA. Langley Research Center, Joint University Program for Air Transportation Research, 1992-1992 Feb. 1993 p 151-172 Presented at the Aerospace Vehicle Dynamics and Control, Bedford, England, 7-10 Sep. 1992 (For primary document see N93-22561 08-01)
(Contract NGL-31-001-252; DAAL03-89-K-0092)
Avail: CASI HC A03/MF A02

The capabilities of flight control systems can be enhanced by designing them to emulate functions of natural intelligence. Intelligent control functions fall in three categories. Declarative actions involve decision-making, providing models for system monitoring, goal planning, and system/scenario identification. Procedural actions concern skilled behavior and have parallels in guidance, navigation, and adaptation. Reflexive actions are spontaneous, inner-loop responses for control and estimation. Intelligent flight control systems learn knowledge of the aircraft and its mission and adapt to changes in the flight environment. Cognitive models form an efficient basis for integrating 'outer-loop/inner-loop' control functions and for developing robust parallel-processing algorithms. Author

SWEPT WING ATTACHMENT LINE CONTAMINATION FENCE Patent Application
Bruce J. Holmes, inventor (to NASA) 13 Dec. 1991 9 p

(NASA-Case-LAR-13400-1; NAS 1.71:LAR-13400-1; US-Patent-Appl-SN-806066) Avail: CASI HC A02/MF A01

A device for controlling attachment line contamination on an airfoil is presented. A fence is installed on the leading edge of the airfoil in the freestream direction perpendicular to the airfoil, outboard of the fuselage boundary layer. The inboard side of the fence arrests the spanwise movement of the turbulent boundary layer while the laminar boundary layer on the outboard side of the fence eliminates any further turbulent contamination of the attachment line. AN APPROXIMATE METHOD FOR ESTIMATING THE LIFTING CHARACTERISTICS OF THIN BODIES OF NON-CIRCULAR CROSS-SECTION

P. A. T. Christopher Jan. 1990 100 p

(Cranfield-Aero-9006; ISBN-1-871564-42-5; ETN-93-93551) Avail: CASI HC A05/MF A02; Cranfield Inst. of Tech., Coll. Aeronautics, Cranfield, Bedford MK43 0AL, England, HC

A method based on that of Sacks for predicting the normal force distribution in thin bodies of noncircular cross section is developed. From this, the ratio, F(sub N), between the normal force gradient on the body of noncircular cross section and that of circular cross section, is calculated, the cross sectional area distribution, in the axial sense, being the same for both bodies. From a known, accurate, distribution on a body of revolution, the distribution on related families of bodies of noncircular cross section can be calculated, simply by multiplying by F(sub N)(x). The accurate distribution on the body of revolution may come from any convenient source including experiment. One way is to generate the lifting body by means of axial distributions of doublets. Both the indirect and direct aerodynamic problems are addressed and the technique is shown to offer a possible means for the design of lifting bodies. ESA

WING FLUTTER BOUNDARY PREDICTION USING AN UNSTEADY EULER AERODYNAMIC METHOD

Elizabeth M. Lee-Rausch and John T. Batina Mar. 1993 13 p Proposed for presentation at the 34th AIAA/ASME/ASCE/AHS/ASC Structures, Structural Dynamics and Materials Conference, La Jolla, CA, Apr. 1993

(RTOP 505-63-50-12)

(NASA-TM-107732; NAS 1.15:107732) Avail: CASI HC A03/MF A01

Modifications to an existing three-dimensional, implicit, upwind Euler/Navier-Stokes code (CFL3D Version 2.1) for the aeroelastic analysis of wings are described. These modifications, which were previously added to CFL3D Version 1.0, include the incorporation of a deforming mesh algorithm and the addition of the structural equations of motion for their simultaneous time-integration with the government flow equations. The paper gives a brief description of these modifications and presents unsteady calculations which check the modifications to the code. Euler flutter results for an isolated 45 degree swept-back wing are compared with experimental data for seven freestream Mach numbers which define the flutter boundary over a range of Mach number from 0.499 to 1.14. These comparisons show good agreement in flutter characteristics for freestream Mach numbers below unity. For freestream Mach numbers above unity, the computed aeroelastic results predict a premature rise in the flutter boundary as compared with the experimental boundary. Steady and unsteady contours of surface Mach number and pressure are included to illustrate the basic flow characteristics of the time-marching flutter calculations and to aid in identifying possible causes for the premature rise in the computational flutter boundary. AUTOMATIC COMPUTATION OF WING-FUSELAGE INTERSECTION LINES AND FILLET INSERTS WITH FIXED-AREA CONSTRAINT

Raymond L. Barger and Mary S. Adams Washington Mar. 1993 19 p

(RTOP 505-59-53-01)

(NASA-TM-4406; L-17131; NAS 1.15:4406) Avail: CASI HC A03/MF A01

Procedures for automatic computation of wing-fuselage juncture geometry are described. These procedures begin with a geometry in wave-drag format. First, an intersection line is computed by extrapolating the wing to the fuselage. Then two types of filleting procedures are described, both of which utilize a combination of analytical and numerical techniques appropriate for automatic calculation. An analytical technique for estimating the added volume due to the fillet is derived, and an iterative procedure for revising the fuselage to compensate for this additional volume is given. Sample results are included in graphical form. Author

SPATIAL ADAPTATION PROCEDURES ON TETRAHEDRAL MESHES FOR UNSTEADY AERODYNAMIC FLOW CALCULATIONS

Russ D. Rausch, John T. Batina, and Henry T. Y. Yang Feb. 1993 15 p Presented at the AIAA 31st Aerospace Sciences Meeting, Reno, NV, 11-14 Jan. 1993 Previously announced in IAA as A93-21116

(RTOP 505-63-50-12)

(NASA-TM-107726; NAS 1.15:107726) Avail: CASI HC A03/MF A01

Spatial adaptation procedures for the accurate and efficient solution of steady and unsteady inviscid flow problems are described. The adaptation procedures were developed and implemented within a three-dimensional, unstructured-grid, upwind-type Euler code. These procedures involve mesh enrichment and mesh coarsening to either add points in high gradient regions of the flow or remove points where they are not needed, respectively, to produce solutions of high spatial accuracy at minimal computational cost. A detailed description of the enrichment and coarsening procedures are presented and comparisons with experimental data for an ONERA M6 wing and an exact solution for a shock-tube problem are presented to provide an assessment of the accuracy and efficiency of the capability. Steady and unsteady results, obtained using spatial adaptation procedures, are shown to be of high spatial accuracy, primarily in that discontinuities such as shock waves are captured very sharply. SUBSONIC AERODYNAMIC CHARACTERISTICS OF A PROPOSED ADVANCED MANNED LAUNCH SYSTEM ORBITER CONFIGURATION

George M. Ware and Charles H. Fox, Jr. Washington Feb. 1993 30 p

(RTOP 506-40-61-01)

(NASA-TM-4439; L-17182; NAS 1.15:4439) Avail: CASI HC A03/MF A01

The Advanced Manned Launch System is a proposed near-term technology, two-stage, fully reusable launch system that consists of an unmanned glide-back booster and a manned orbiter. An orbiter model that featured a large fuselage and an aft delta wing with tip fins was tested in the Langley 7- by 10-Foot High-Speed Tunnel. A crew cabin, large payload fairing, and crew access tunnel were mounted on the upper body. The results of the investigation indicated that the configuration was longitudinally stable to an angle of attack of about 6 deg about a center-of-gravity position of 0.7 body length. The model had an untrimmed lift-drag ratio of 6.6, but could not be trimmed at positive lift. The orbiter model was also directionally unstable. The payload fairing was responsible for about half the instability. The tip-fin controllers, which are designed as active controls to produce artificial directional stability, were effective in producing yawing moment, but sizable adverse rolling moment occurred at angles of attack above 6 deg. Differential deflection of the elevon surfaces was effective in producing rolling moment with only small values of adverse yawing moment. Author

FLIGHT INVESTIGATION OF THE EFFECT OF TAIL BOOM STRAKES ON HELICOPTER DIRECTIONAL CONTROL

Henry L. Kelly, Cynthia A. Crowell, Kenneth R. Yenni, and Michael B. Lance (Lockheed Engineering and Sciences Co., Hampton, VA.) Washington Feb. 1993 42 p

(DA Proj. 1L1-62211-A-47-A; RTOP 505-59-36-01)

(NASA-TP-3278; L-17068; NAS 1.60:3278; ATCOM-TR-93-A-003) Avail: CASI HC A03/MF A01

A joint U.S. Army/NASA flight investigation was conducted utilizing a single-rotor helicopter to determine the effectiveness of horizontally mounted tail boom strakes on directional controllability and tail rotor power during

low-speed, crosswind operating conditions. Three configurations were investigated: (1) baseline (strakes off), (2) single strake (strake at upper shoulder on port side of boom), and (3) double strake (upper strake plus a lower strake on same side of boom). The strakes were employed as a means to separate airflow over the tail boom and change fuselage yawing moments in a direction to improve the yaw control margin and reduce tail rotor power. Crosswind data were obtained in 5-knot increments of airspeed from 0 to 35 knots and in 30 deg increments of wind azimuth from 0 deg to 330 deg. At the most critical wind azimuth and airspeed in terms of tail rotor power, the strakes improved the pedal margin by 6 percent of total travel and reduced tail rotor power required by 17 percent. The increase in yaw control and reduction in tail rotor power offered by the strakes can expand the helicopter operating envelope in terms of gross weight and altitude capability. The strakes did not affect the flying qualities of the vehicle at airspeeds between 35 and 100 knots. Author

UPWIND RELAXATION METHOD FOR HYPERSONIC FLOW SIMULATION [UPWIND-RELAXATIONSMETHODE FUER DIE SIMULATION VON HYPERSCHALL-STROEMUNGEN]
Bernhard Mueller 25 Sep. 1991 85 p
(DLR-FB-91-36; ETN-93-91925) Avail: CASI HC A05/MF A01; DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

Upwind relaxation strategies were developed for space and time marching methods to solve the three dimensional Euler and thin layer Navier-Stokes equations for steady hypersonic flow of perfect gas over pointed and blunt bodies, respectively. The inviscid fluxes are discretized an upwind scheme, and the viscous fluxes are second order central differenced. For pointed bodies, the space marching method iterates the time dependent difference equations to the steady state in crossflow planes starting from a conical solution near the body apex. For blunt bodies, the time marching method employs an alternating planar Gauss-Seidel relaxation in the streamwise direction. Stability and convergence are enhanced by underrelaxing each wave in the crossflow planes individually. The methods are validated for inviscid and laminar hypersonic flows over a 10 deg circular cone and a sphere 15 deg cone. The present space marching method is about one order of magnitude more efficient than the time marching method. ESA

AERODYNAMIC SENSITIVITY ANALYSIS IN THE TRANSONIC REGIME Ph.D. Thesis
Hesham Mahmoud El-Banna 1992 185 p
Avail: Univ. Microfilms Order No. DA9300429

The quasi-analytical approach is developed and applied to the three dimensional full potential equation to compute wing aerodynamic sensitivity coefficients in the transonic regime. Symbolic manipulation is used to reduce the effort associated with obtaining the sensitivity equations, and the large sensitivity system is solved using 'state of the art' routines. Various case studies are conducted and the results are compared to those obtained by the direct finite difference approach. Both methods are evaluated to determine their computational accuracy and efficiency. The quasi-analytical approach is shown to be accurate and efficient for large aerodynamic systems. Dissert. Abstr.

HYPERSONIC THREE-DIMENSIONAL NONEQUILIBRIUM BOUNDARY-LAYER EQUATIONS IN GENERALIZED CURVILINEAR COORDINATES
Jong-Hun Lee Feb. 1993 63 p
(Contract NAS9-18493)
(NASA-CR-185677; NAS 1.26:185677) Avail: CASI HC A04/MF A01

The basic governing equations for the second-order three-dimensional hypersonic thermal and chemical nonequilibrium boundary layer are derived by means of an order-of-magnitude analysis. A two-temperature concept is implemented into the system of boundary-layer equations by simplifying the rather complicated general three-temperature thermal gas model. The equations are written in a surface-oriented non-orthogonal curvilinear coordinate system, where two curvilinear coordinates are non-orthogonial and a third coordinate is normal to the surface. The equations are described with minimum use of tensor expressions arising from the coordinate transformation, to avoid unnecessary confusion for readers. The set of equations obtained will be suitable for the development of a three-dimensional nonequilibrium boundary-layer code. Such a code could be used to determine economically the aerodynamic/aerothermodynamic loads to the surfaces of hypersonic vehicles with general configurations. In addition, the basic equations for three-dimensional stagnation flow, of which solution is required as an initial value for space-marching integration of the boundary-layer equations, are given along with the boundary conditions, the boundary-layer parameters, and the inner-outer layer matching procedure. Expressions for the chemical reaction rates and the thermodynamic and transport properties in the thermal nonequilibrium environment are explicitly given. Author

NAVIER-STOKES ANALYSIS OF AIRFOILS WITH LEADING EDGE ICE ACCRETIONS Final Report
Mark G. Potapczuk Feb. 1993 206 p
(Grant NAG3-416; RTOP 505-68-10)
(NASA-CR-191008; E-7580; NAS 1.26:191008) Avail: CASI HC A10/MF A03

A numerical analysis of the flowfield characteristics and the performance degradation of an airfoil with leading edge ice accretions was performed. The important fluid dynamic processes were identified and calculated. Among these were the leading edge separation bubble at low angles of attack, complete separation on the low pressure surface resulting in premature shell, drag rise due to the ice shape, and the effects of angle of attack on the separated flow field. Comparisons to experimental results were conducted to confirm these calculations. A computer code which solves the Navier-Stokes equations in two dimensions, ARC2D, was used to perform the calculations. A Modified Mixing Length turbulence model was developed to produce grids for several ice shape and airfoil combinations. Results indicate that the ability to predict overall performance characteristics, such as lift and drag, at low angles of attack is excellent. Transition location is important for accurately determining separation bubble shape. Details of the flowfield in and downstream of the separated regions requires some modifications. Calculations for the stalled airfoil indicate periodic shedding of vorticity that was generated aft of the ice accretion. Time averaged pressure values produce results which compare favorably with experimental information. A turbulence model which accounts for the history effects in the flow may be justified. Author

AN EXPERIMENTAL STUDY OF THE AERODYNAMICS OF A NACA0012 AIRFOIL WITH A SIMULATED GLAZE ICE ACCRETION, VOLUME 2 Final Report
Michael B. Bragg Cleveland, OH Mar. 1993 406 p
(Contract NAS3-28; RTOP 505-68-10)
(NASA-CR-191007; E-7690; NAS 1.26:191007) Avail: CASI HC A18/MF A04

This is the second volume of a report documenting the effect of simulated ice accretion on the aerodynamic performance of a NACA 0012 airfoil. Both an experimentally measured and a computer generated ice shape are studied. The purpose of this report is to present the results of the measurements, not an analysis of the data. Surface pressure, integrated lift and pitching moment data are presented as well as drag from a wake

survey. A split hot film probe was used to document the flow-field about the airfoil with simulated ice. Data in the separation bubbles, reattached boundary layer and wake are presented. Both tabulated and graphical data are presented in the paper. The data are also available on computer disk for easy access. Author (revised)

CHARACTERIZATION OF CAVITY FLOW FIELDS USING PRESSURE DATA OBTAINED IN THE LANGLEY 0.3-METER TRANSONIC CRYOGENIC TUNNEL

M. B. Tracy and E. B. Plentovich Washington Mar. 1993 35 p
(RTOP 505-68-70-08)
(NASA-TM-4436; L-17158; NAS 1.15:4436) Avail: CASI HC A03/MF A01

Static and fluctuating pressure distributions were obtained along the floor of a rectangular-box cavity in an experiment performed in the LaRC 0.3-Meter Transonic Cryogenic Tunnel. The cavity studied was 11.25 in. long and 2.50 in. wide with a variable height to obtain length-to-height ratios of 4.4, 6.7, 12.67, and 20.0. The data presented herein were obtained for yaw angles of 0 deg and 15 deg over a Mach number range from 0.2 to 0.9 at a Reynolds number of 30 x 10(exp 6) per ft with a boundary-layer thickness of approximately 0.5 in. The results indicated that open and transitional-open cavity flow supports tone generation at subsonic and transonic speeds at Mach numbers of 0.6 and above. Further, pressure fluctuations associated with acoustic tone generation can be sustained when static pressure distributions indicate that transitional-closed and closed flow fields exist in the cavity. Cavities that support tone generation at 0 deg yaw also supported tone generation at 15 deg yaw when the flow became transitional-closed. For the latter cases, a reduction in tone amplitude was observed. Both static and fluctuating pressure data must be considered when defining cavity flow fields, and the flow models need to be refined to accommodate steady and unsteady flows. Author (revised)

ATTENUATION OF EMPENNAGE BUFFET RESPONSE THROUGH ACTIVE CONTROL OF DAMPING USING PIEZOELECTRIC MATERIAL

Jennifer Heeg, Jonathan M. Miller (Cornell Univ., Ithaca, NY.), and Robert V. Doggett, Jr. Feb. 1993 17 p Presented at Damping 1993, San Francisco, CA, 24-26 Feb. 1993
(RTOP 590-14-61-01)
(NASA-TM-107736; NAS 1.15:107736) Avail: CASI HC A03/MF A01

Dynamic response and damping data obtained from buffet studies conducted in a low-speed wind tunnel by using a simple, rigid model attached to spring supports are presented. The two parallel leaf spring supports provided a means for the model to respond in a vertical translation mode, thus simulating response in an elastic first bending mode. Wake-induced buffeting flow was created by placing an airfoil upstream of the model of that the wake of the airfoil impinged on the model. Model response was sensed by a strain gage mounted on one of the springs. The output signal from the strain gage was fed back through a control law implemented on a desktop computer. The processed signals were used to 'actuate' a piezoelectric bending actuator bonded to the other spring in such a way as to add damping as the model responded. The results of this 'proof-of-concept' study show that the piezoelectric actuator was effective in attenuating the wake-induced buffet response over the range of parameters investigated. Author

MIXED CONVECTIVE/DYNAMIC ROLL VORTICES AND THEIR EFFECTS ON INITIAL WIND AND TEMPERATURE PROFILES

Tracy Haack (National Oceanic and Atmospheric Administration, Washington, DC.) and Hampton N. Shirer Jul. 1991 114 p
(Contract NAG8-780; NAS8-36150)
(NASA-CR-192349; NAS 1.26:192349) Avail: CASI HC A06/MF A02

The onset and development of both dynamically and convectively forced boundary layer rolls are studied with linear and nonlinear analyses of a truncated spectral model of shallow Boussinesq flow. Emphasis is given here on the energetics of the dominant roll modes, on the magnitudes of the roll-induced modifications of the initial basic state wind and temperature profiles, and on the sensitivity of the linear stability results to the use of modified profiles as basic states. It is demonstrated that the roll circulations can produce substantial changes to the cross-roll component of the initial wind profile and that significant changes in orientation angle estimates can result from use of a roll-modified profile in the stability analysis. These results demonstrate that roll contributions must be removed from observed background wind profiles before using them to investigate the mechanisms underlying actual secondary flows in the boundary layer. The model is developed quite generally to accept arbitrary basic state wind profiles as dynamic forcing. An Ekman profile is chosen here merely to provide a means for easy comparison with other theoretical boundary layer studies; the ultimate application of the model is to study observed boundary layer profiles. Results of the analytic stability analysis are validated by comparing them with results from a larger linear model. For an appropriate Ekman depth, a complete set of transition curves is given in forcing parameter space for roll modes driven both thermally and dynamically. Preferred orientation angles, horizontal wavelengths and propagation frequencies, as well as energetics and wind profile modifications, are all shown to agree rather well with results from studies on Ekman layers as well as with studies on near-neutral and convective atmospheric boundary layers.

OPTIMIZATION OF FLIGHT TRAJECTORIES IN A 3D MODEL OF WINDSHEAR FLOW FIELD Ph.D. Thesis

Hoo Wang 1992 109 p
Avail: Univ. Microfilms Order No. DA9234375

This thesis is concerned with the optimal flight trajectories in the presence of a three-dimensional windshear. Both the take-off and abort landing problems are studied. A mathematical model of a three-dimensional windshear is developed by the superposition of the flow fields of two symmetric vortex rings with appropriate parameters (circulation strength, radius, height). The flow field produced by this vortex ring pair is close to that of a real microburst. The wind components are functions of the geometric coordinates and can be obtained using either Biot-Savart law or the properties of the stream function. With this wind model, the strongest windshear and downdraft are located in a vertical plane passing through the central axis of the vortex ring pair. Therefore, in the computation of flight trajectories, the aircraft is assumed to fly in this vertical plane. Two cases are considered: (1) at the initial time, the aircraft is located in the region of strongest headwind; (2) at the initial time, the aircraft is located in the region of weak-to-moderate headwind. Case 1 implies late detection, while case 2 implies early detection of windshear. Optimal trajectories are computed for both take-off and abort landing. For the take-off problem, the performance index being minimized is the peak value of the deviation of the absolute path inclination from a reference value; for the abort landing problem, the performance index being minimized is the peak value of the altitude drop. The resulting optimal control problems are Chebyshev problems, which are converted into Bolza problems via suitable transformations. Then, the Bolza problems are solved by using the sequential gradient-restoration algorithm (SGRA). Numerical computations for both the take-off and abort landing problems lead to the following conclusions: (1) The survival capability of the optimal trajectory is superior to that of the constant pitch trajectory and the maximum angle of attack trajectory; this means that near-optimal guidance schemes should be developed to improve the survival capability of an aircraft in a severe windshear. (2) For the optimal trajectories, the survival capability in Case 2 (early detection) is superior to that in Case 1 (late detection); this indicates that early detection of a windshear can ehnace the safety of flight. NUMERICAL PREDICTION OF TRANSITION OF THE F-16 WING AT SUPERSONIC SPEEDS Final Report

Russell M. Cummings Mar. 1993 3 p

(Contract NCC2-754)

(NASA-CR-192706; NAS 1.26:192706) Avail: CASI HC A01/MF A01

This work is part of the high speed research program currently underway at NASA. This project has the goal of gaining understanding of the technical requirements for supersonic-hypersonic flight. Specifically, this research is part of a continuing project to study the laminar flow over swept wings at high speeds and involves the numerical prediction of the flow about the F-16XL wing. The research uses the CNS/ARC3D codes and the resulting crossflow velocity components in order to estimate transition locations on the wing. Effects of angle of attack on the extent of laminar flows was found to be minimal. This result can be attributed to the fact that a laminar flow airfoil was used in this study, which has a continuous favorable pressure gradient over approximately the first 20 percent of the chord for angles of attacks up to 10 degrees. It should also be noted that even after 20 percent chord the pressure gradient either slowly continued to increase, but never decreased before 90 percent chord, except for the higher swept cases when separation occurs. Angles of attack greater than 10 degrees were not considered since this study assumes natural laminar flow for normal supersonic cruise flight conditions. Derived from text

A STUDY OF THE ACCURACY OF NEUTRALLY BUOYANT BUBBLES USED AS FLOW TRACERS IN AIR

Michael F. Kerho Cleveland, OH Mar. 1993 82 p Original contains color illustrations

(Grant NAG3-1134; RTOP 505-68-10)

(NASA-CR-191088; E-7630; NAS 1.26:191088) Avail: CASI HC A05/MF A01; 4 functional color pages

Research has been performed to determine the accuracy of neutrally buoyant and near neutrally buoyant bubbles used as flow tracers in air. Theoretical, computational, and experimental results are presented to evaluate the dynamics of bubble trajectories and factors affecting their ability to trace flow-field streamlines. The equation of motion for a single bubble was obtained and evaluated using a computational scheme to determine the factors which affect a bubble's trajectory. A two-dimensional experiment was also conducted to experimentally determine bubble trajectories in the stagnation region of NACA 0012 airfoil at 0 deg angle of attack using a commercially available helium bubble generation system. Physical properties of the experimental bubble trajectories were estimated using the computational scheme. These properties included the density ratio and diameter of the individual bubbles. the helium bubble system was then used to visualize and document the flow field about a 30 deg swept semispan wing with simulated glaze ice. Results were compared to Navier-Stokes calculations and surface oil flow visualization. The theoretical and computational analysis have shown that neutrally buoyant bubbles will trace even the most complex flow patterns. Experimental analysis revealed that the use of bubbles to trace flow patterns should be limited to qualitative measurements unless care is taken to ensure neutral buoyancy. This is due to the difficulty in the production of neutrally buoyant bubbles. Author (revised)

AN OVERVIEW OF AEROELASTICITY STUDIES FOR THE NATIONAL AEROSPACE PLANE

Rodney H. Ricketts, Thomas E. Noll, Lawrence J. Huttsell, and Lawrence J. Hutsell Mar. 1993 13 p Presented at the AIAA 34th SDM Conference, 19-23 Apr. 1993

(RTOP 763-23-41)

(NASA-TM-107728; NAS 1.15:107728) Avail: CASI HC A03/MF A01

The National Aero-Space Plane (NASP), or X-30, is a single-stage-to-orbit vehicle that is designed to takeoff and land on conventional runways. Research in aeroelasticity was conducted by NASA and the Wright Laboratory to support the design of a flight vehicle by the national contractor team. This research includes the development of new computational codes for predicting unsteady aerodynamic pressures. In addition, studies were conducted to determine the aerodynamic heating effects on vehicle aeroelasticity and to determine the effects of fuselage flexibility on the stability of the control systems. It also includes the testing of scale models to better understand the aeroelastic behavior of the X-30 and to obtain data for code validation and correlation. This paper presents an overview of the aeroelastic research which has been conducted to support the airframe design. Author (revised)

UNSTEADY BLADE PRESSURES ON A PROPFAN: PREDICTED AND MEASURED COMPRESSIBILITY EFFECTS Final Report

M. Nallasamy Jul. 1992 16 p Presented at the 28th Joint Propulsion Conference and Exhibit, Nashville, TN, 6-8 Jul. 1992; sponsored by AIAA, SAE, ASME, and ASEE Original contains color illustrations

(Contract NAS3-25266; RTOP 535-03-10)

(NASA-CR-191087; E-7631; NAS 1.26:191087) Avail: CASI HC A03/MF A01; 2 functional color pages

The effect of compressibility on unsteady blade pressures is studied by solving the three-dimensional Euler equations. The operation of the eight-bladed SR7L propfan at a 4.75 deg angle of attack was considered. Euler solutions were obtained for three Mach numbers, 0.6, 0.7 and 0.8, and the predicted blade pressure waveforms were compared with flight data. The comparisons show that in general, the effect of Mach number on pressure waveforms are correctly predicted. The change in pressure waveforms are minimal when the Mach number is increased from 0.6 to 0.7. Increasing the Mach number from 0.7 to 0.8 produces significant changes in predicted pressure levels. The predicted amplitudes, however, differ from measurements at some transducer locations. At all the three Mach numbers, the measured (installed propfan) pressure waveforms show a relative phase lag compared to the computed (propfan along) waveforms due to installation effects. Measured waveforms in the blade tip region show nonlinear variations which are not captured by the present numerical procedure. Author (revised)

TRANSVERSE INJECTION OF LIQUID AND GASEOUS FUELS INTO SUBSONIC/SUPERSONIC FLOW Final Report, Sep. 1988 - Dec. 1991

D. Papamoschou, W. A. Sirignano, and G. S. Samuelsen May 1992 81 p

(Contract F33615-88-C-2889)

(AD-A259771; UCI-ARTR-92-2; WL-TR-92-2046) Avail: CASI HC A05/MF A01

The goal of the program was to provide needed insight into the mixing behavior of liquid and gaseous jets injected transversely into a high velocity crossflow. The penetration of round supersonic jets normal to a supersonic cross flow was studied experimentally in a specially configured supersonic wind tunnel. The cross-flow stream consisted of air at Mach numbers of 2 and 3. The jet Mach number ranged from 1 to 3.53 and the jet gases employed were helium and argon. Schieren photography was the primary diagnostic. The effects of jet-to-freestream momentum ratio, jet and freestream Mach numbers, and pressure and density ratios at the jet exit were examined. It is found that penetration is strongly dependent on momentum ratio, weakly dependent on Mach numbers and pressure ratio, and independent of density ratio. For fixed momentum ratio, increasing freestream Mach number produced a small increase in penetration, while changing the jet Mach number produced no apparent effect. Values of pressure ratio that appear to maximize penetration are suggested. Flow visualization reveals large-scale turbulent structures in the jet and significant steadiness of the bow shock in front of the jet. GRA

TIP-VORTEX/AIRFRAME INTERACTIONS Ph.D. Thesis

Habib Affes 1992 297 p

Avail: Univ. Microfilms Order No. DA9238117

The flow field generated by a helicopter in flight is extremely complex and it has been recognized that interactions between different components can significantly affect helicopter performance. In particular, the effects of the interaction between the rotor wake, which consists of a highly

three-dimensional helical vortex sheet and a high-strength tip-vortex, and the helicopter fuselage are extremely difficult to predict and pose a challenging problem for researchers and designers in the rotorcraft area. In the present work, the unsteady interaction of the rotor tip-vortex with the fuselage and the problem of the three-dimensional boundary-layer so generated on the fuselage underneath the vortex are investigated. In the first phase of the present work, a simplified model for the interaction of a rotor-tip-vortex with a fuselage or airframe is developed using three-dimensional potential flow analysis. The tip-vortex is idealized as a single three-dimensional vortex filament and the fuselage is modeled by an infinitely long circular cylinder. The Biot-Savart law is employed to describe the flow induced by the vortex and the flow is assumed to be inviscid and irrotational outside of the core of the vortex. The present analytical/numerical results for both the vortex trajectory and the pressure distribution on the airframe are in substantial agreement with experimental results prior to impact of the vortex with the airframe. The numerical calculations indicate that a large adverse pressure gradient develops under the vortex on the fuselage causing a rapid drop in the pressure there. The second phase of the present work focuses on the problem of the unsteady three-dimensional boundary-layer flow induced by the vortex filament moving above the fuselage. Three types of external flow in which the vortex is embedded are considered. These flows are respectively a stagnant medium, a symmetric mean flow and an asymmetric mean flow, the latter of which corresponds to the experimental conditions described above. In each case, the computed results show the development of a variety of complex three-dimensional boundary-layer separation phenomena. In all cases, the boundary-layer solutions show for formation of a secondary eddy which grows in time; this situation is expected to lead to an eruption of boundary-layer fluid into the free stream. The secondary eddy initially starts from a bubble-like shape of swirling flow and then evolves into a more complex structure; in particular, in the symmetric mean flow case, the secondary eddy evolves and grows in time and resembles the initiation of a horseshoe type vortex. ACTIVE CONTROL OF THE SEPARATION REGION ON A TWO-DIMENSIONAL AIRFOIL Ph.D. Thesis
Julie Anne Lovato 1992 148 p
Avail: Univ. Microfilms Order No. DA9238408

The effectiveness of combat aircraft depends in part on their ability to maintain high lift under extreme conditions. Examples of such conditions include the high angle of attack, rapid pitch motions necessary for combat maneuvers. A well known phenomenon occurring on airfoils undergoing such high angle of attack motions is the formation of a leading edge vortex. This vortex is preceded by significant increases in lift, but is also accompanied by subsequent rapid loss of lift and the ensuing dynamic stall. Prior to dynamic stall vortex formation, the unsteady separating boundary layer resembles the separating boundary layer over a static airfoil. Before developing control methodologies for unsteady flows, it is necessary to obtain a thorough understanding of the controlled flow over a static airfoil. This experimental analysis presents a comprehensive study of the separating boundary layer over a static airfoil under natural and actively controlled conditions. Near-surface hot-film and surface pressure measurements, as well as flow visualization are used to analyze the large-scale nature of the flow and determine forcing effects. Results from the static study are then extended for an initial evaluation of unsteady airfoil control. The fundamental frequency for a two-dimensional NACA-0015 airfoil is found to be an integral multiple of the frequency associated with wake structures. The static separating boundary layer response to active control confirms that it is a boundary layer transitioning to a free shear layer. Qualitative analyses show that significant reduction in overall static separation can be achieved under forcing conditions. Upper airfoil surface suction values are also significantly increased over the natural values. Applying tangential pulsed air control at static fundamental frequencies to a dynamic airfoil results in delay of the dynamic stall vortex formation and a delay of dynamic stall. These discoveries indicate that the developed control methodology may prove successful in increasing unsteady aircraft maneuverability. Dissert. Abstr.

ASYMPTOTIC ANALYSIS OF: 1: WAVE PROPAGATION IN DISPERSIVE OPTICAL MEDIA WITH QUADRATIC NONLINEARITY. 2: A HYPERSONIC WING WITH THREE-DIMENSIONAL SELF-SIMILARITY Ph.D. Thesis
Andre Gabor Kalocsai 1992 134 p
Avail: Univ. Microfilms Order No. DA9236227

An asymptotic analysis is presented for two distinct and independent problems: (1) Wave propagation in dispersive optical media with quadratic nonlinearity; and (2) Hypersonic flows with three dimensional self-similarity. Asymptotic methods are useful for physical problems with small parameters in that the dominant physical process may be extracted from various parameter regimes that result in a simplified self-consistent mathematical analysis. The asymptotic method used depends critically upon the physical problem. In the optics problem, we at first study single and multiple input propagating waves at frequencies away from dielectric resonances. Here we compare the Slowly Varying Envelope Approximation to the Method of Multiple Scales and show that the Method of Multiple Scales is a superior technique that can be applied self consistently to any perturbation order which in turn predicts new physical effects. For the singly slowly modulated input wave problem, under appropriate conditions, we show that at the O(epsilon squared) perturbation, we obtain the cubic nonlinear Schrodinger equation. This means that for the single input wave propagating in a quadratic nonlinear medium, self-modulation effects and soliton behavior may be observed depending on the boundary conditions. For the problem with two input waves without phase matching, typical cross phase modulation equations are derived which are coupled cubic nonlinear Schrodinger equations. When two input waves have good phase matching, different asymptotic equations are obtained and illustrated such as the usual second harmonic generation problem which is a degenerate three wave mixing problem. For the single input wave near a classical dielectric resonance, we find that the wave number becomes amplitude dependent. The method of multiple scales is replaced by Whitham's averaged Lagrangian. We derive the associated modulated envelope equations. We investigate an effective medium regime and the full nonlinear problem. The hypersonic flow problem requires the use of asymptotic matching that arises from the geometry from the problem. Here the pressure field and lift to drag ratio C(sub L)(sup 3/2)/C(sub D) is evaluated for a wide delta wing with small power law curvature. Use is made of Hypersonic Small Disturbance Theory and three dimensional power law similarity. It is shown that an improvement for C(sub L)(sup 3/2)/C(sub D) occurs for wings with power law curvatures greater than one, when compared to flat delta wings. This improvement in performance agrees qualitatively with other types of concave wings.

A NONLINEAR DYNAMIC SPHERICAL MEMBRANE MODEL Final Report, Aug. 1991 - Jul. 1992
Richard J. Benney Jan. 1993 125 p
(DA Proj. 1L1-62786-D-283)
(AD-A259633; NATICK-TR-93/017) Avail: CASI HC A06/MF A02

A static set of nonlinear spherical membrane equations are modified to model the dynamic response of a spherical membrane to a time dependent pressure distribution. The two governing partial differential equations (PSE's) were converted into a system of nonlinear first order differential equations which are finite differenced in space and solved numerically. The model is a first step towards modeling the dynamic response of parachutes during the complex opening phase. The ultimate end use for a numerical structural dynamic canopy model is to couple it with a numerical model of the fluid medium surrounding the canopy. The project involves coupling the computational fluid dynamics (CFD) code SALE (Simplified Arbitrary Lagrangian Eulerian) to a modified version of the spherical membrane model FORTRAN programs described in this report. The spherical membrane model coupled to the CFD code SALE will be a major step towards the solution of the opening problem of parachutes. The solution of the opening problem will provide essential information to aid in the design of high-speed, low-altitude airdrop systems. GRA

COMPUTATION OF ROTOR AERODYNAMIC LOADS IN FORWARD FLIGHT USING A FULL-SPAN FREE WAKE ANALYSIS

Todd R. Quackenbush, Donald B. Bliss, Daniel A. Wachspress, Alexander H. Boschitsch, and Kiat Chua Oct. 1990 139 p
(Contract NAS2-13838; RTOP 505-59-36)
(NASA-CR-177611; A-91136; NAS 1.26:177611) Avail: CASI HC A07/MF A02

The development of an advanced computational analysis of unsteady aerodynamic loads on isolated helicopter rotors in forward flight is described. The primary technical focus of the development was the implementation of a freely distorting filamentary wake model composed of curved vortex elements laid out along contours of constant vortex sheet strength in the wake. This model captures the wake generated by the full span of each rotor blade and makes possible a unified treatment of the shed and trailed vorticity in the wake. This wake model was coupled to a modal analysis of the rotor blade dynamics and a vortex lattice treatment of the aerodynamic loads to produce a comprehensive model for rotor performance and air loads in forward flight dubbed RotorCRAFT (Computation of Rotor Aerodynamics in Forward Flight). The technical background on the major components of this analysis are discussed and the correlation of predictions of performance, trim, and unsteady air loads with experimental data from several representative rotor configurations is examined. The primary conclusions of this study are that the RotorCRAFT analysis correlates well with measured loads on a variety of configurations and that application of the full span free wake model is required to capture several important features of the vibratory loading on rotor blades in forward flight. SLOTTED-WALL FLOW-FIELD MEASUREMENTS IN A TRANSONIC WIND TUNNEL (Diskette Supplement)

Joel L. Everhart, William B. Igoe, and Stuart G. Flechner Washington Aug. 1991 110 p, Diskette supplement: IBM compatible 3.5-inch diskette in ASCII format
(RTOP 506-40-41-02)
(NASA-TM-4280; L-16865; NAS 1.15:4280; NONP-Suppl-DK-93-153709)
Avail: Issuing Activity (Center for AeroSpace Information) HC/DK A13

Flowfield measurements obtained on the normal centerplane passing through a longitudinal slot in the wall of a transonic wind tunnel are presented. Data were acquired with a three-tube flow-angle probe, and distribution of flow angle, Mach number, and total pressure are given for free stream Mach numbers from 4.0 to 0.85. Cases are presented for tunnel empty and with a NACA 0012-64 airfoil model installed. Mass flow through the slot was varied by plenum suction over a range of 0 to 2 percent of the free-stream mass flow. The data are presented without analysis. The run schedule which details specific test conditions for each run is given in an appendix. A tabular listing of the data organized by run number is presented in a second appendix and is also provided on an IBM PC compatible 3.5-in. floppy disk in ASCII format. Author (revised)

ANALYTICAL AND EXPERIMENTAL STUDIES OF A SHORT COMPACT SUBSONIC DIFFUSER FOR A TWO-DIMENSIONAL SUPERSONIC INLET

Chanthy Iek, Richard R. Burley, and Albert L. Johns Mar. 1993 65 p
(RTOP 505-62-71)
(NASA-TP-3247; E-7111; NAS 1.60:3247) Avail: CASI HC A04/MF A01

An experimental study of a two-dimensional supersonic inlet with a short compact subsonic diffuser, length to exit diameter (dl/d) ratio of 1.25, was conducted to investigate the impact of the short diffuser on inlet performance at low speeds and to assess the diffuser subsonic performance for a simulated diffuser flow corresponding to high-speed inlet conditions near the design flight Mach number of 2.2. For the low-speed testing, a drooped lip was employed to improve the inlet performance at a high angle of attack. For the simulated high-speed testing, air was blown through slots or discrete nozzles as an active boundary-layer control. The results from the low-speed performance test were compared with the results from a previous test program on the same inlet with a long subsonic diffuser (dl/d = 4.5). The comparison indicates that inlet recovery was not affected by the use of the short diffuser for either the baseline (no droop) or the drooped cowl lip configuration. However, the inlet baseline distortion for the short diffuser configuration was substantially higher than for the long diffuser. A comparison of the two configurations with a 70 deg drooped lip showed no significant difference in distortion. For the portion of the experimental program in which diffuser conditions for high-speed flight were simulated, diffuser-induced flow separation occurred. This separation was predicted from an analytical study that used the Hess potential flow panel method and the Herring two-dimensional boundary-layer analysis computer codes. The flow separated mainly on the diffuser ramp. Subsequent tests in which boundary-control systems were utilized showed that blowing with either slots or discrete nozzles could suppress the flow separation in the short subsonic diffuser, thereby substantially improving the diffuser performance. UNSTEADY EULER AND NAVIER-STOKES COMPUTATIONS AROUND OSCILLATING DELTA WING INCLUDING DYNAMICS Ph.D. Thesis

Ahmed Abd-El-Bar Ahm Salman 1992 264 p
Avail: Univ. Microfilms Order No. DA9230211

Unsteady flows around rigid or flexible delta wings with and without oscillating leading-edge flaps are considered. These unsteady flow problems are categorized under two classes of problems. In the first class, the wing motion is prescribed a priori and in the second class, the wing motion is obtained as a part of the solution. The formulation of the first class includes either the unsteady Euler or unsteady Navier-Stokes equations for the fluid dynamics and the unsteady linearized Navier-displacement (ND) equations for the grid deformation. The problem of unsteady transonic flow past a bicircular-arc airfoil undergoing prescribed thickening-thinning oscillation is studied using the CFL2D code. This code is used to solve the Navier-Stokes equations using an implicit, flux-difference splitting, finite-volume scheme. For the unsteady supersonic flows around flexible delta wings with prescribed oscillating deformation and rigid delta wings with leading-edge-flap oscillations, the conservative, unsteady Euler and thin-layer Navier-Stokes equations in a moving frame-of-reference, along with the linearized ND equations, have been used. Two main problems are solved to demonstrate the validity of the developed schemes. The first problem is that of a flexible delta wing undergoing a prescribed bending-mode oscillation. In the second problem, a rigid-delta wing with symmetric and anti-symmetric flap oscillations is considered. These applications fall under the first class of problems. For the unsteady flow applications, where the wing motion is not prescribed a priori (second class of problems), either the unsteady Euler or thin-layer Navier-Stokes equations and the rigid-body dynamics equations, in a moving frame of reference, are solved sequentially to obtain the flow behavior and the wing motion. The main application for this class of unsteady flow phenomena, is the wing-rock problem. Using the locally-conical flow assumption, three problems are solved. The first is that of a delta wing undergoing a damped rolling oscillation. The second is that of a delta wing undergoing a limit-cycle, wing-rock motion. In the third problem, suppression of the wing-rock motion is demonstrated using a tuned anti-symmetric oscillation of the leading-edge flaps.

AN EXPERIMENTAL STUDY OF THE DRIVING MECHANISM AND CONTROL OF THE UNSTEADY SHOCK-INDUCED TURBULENT SEPARATION IN A MACH 5 COMPRESSION CORNER FLOW Ph.D. Thesis
William Berton McClure 1992 276 p
Avail: Univ. Microfilms Order No. DA9239313

This experimental study has examined the unsteady flowfield associated with the shock-induced separation of a turbulent boundary layer. The interaction was generated by a 28 deg unswept compression corner in a Mach 5 airstream. Perturbations were made to the interaction to better understand the mechanism responsible for the separation shock dynamics, as well as to demonstrate a method of controlling the shock motion. Local motion of the separation shock is associated with a characteristic signature in the wall pressure fluctuations beneath the incoming turbulent boundary layer. The shape of this signature is dependent only on whether the local shock motion is upstream or downstream. Fluctuating pitot pressure measurements made within the incoming boundary layer indicate that the maximum boundary layer interface crossing frequency is about five times that of the maximum separation shock zero crossing frequency. Power spectra from these pitot pressure data exhibit an increased role of low frequency (less than 2 kHz) fluctuations in the overall variance of the signal. This frequency range closely matches the dominant frequencies found in wall pressure fluctuations beneath the separation shock. Such fluctuations are not evident in the wall pressure or freestream pitot pressure measurements taken upstream of the interaction. Motion and location of the separated shear layer is found to be correlated with that of the separation shock such that the overall separation bubble exhibits a 'breathing' motion. As shown for the first time from the results of this study, the motion of the downstream limit of this bubble predominantly lags that of the upstream limit, independent of the direction of the bubble motion (inflating or collapsing). Motion of both the separation shock and shear layer seem to be secondary responses to primary, but undetermined, changes to the flowfield. Evidence of the shear layer motion is found at least as far downstream as 3.5 times the thickness of the incoming turbulent boundary layer. In all, these data suggest that the separation shock motion and associated flowfield unsteadiness is primarily driven by fluctuations in the outer two-thirds of the incoming turbulent boundary layer. Dissert. Abstr.

N93-24215 Texas Univ., Austin.
THE EFFECT OF LARGE-SCALE UNSTEADY MOTION ON A TURBULENT REATTACHING SHEAR LAYER: APPLICATION TO THE SUPERSONIC COMPRESSION RAMP Ph.D. Thesis
Martin Joseph Guillot 1992 210 p
Avail: Univ. Microfilms Order No. DA9239262

A phenomenological model is developed to simulate the effect of large-scale unsteadiness which develops in a supersonic reattaching shear layer. The effect of the unsteadiness, predicted by the model, upon the mean flowfield in the reattachment region of a supersonic compression ramp, where flow separation and subsequent reattachment occurs, is then investigated. A triple decomposition is performed on the governing equations. The instantaneous values of velocity and pressure are decomposed into lower frequency, quasi-periodic fluctuations, higher frequency, random turbulent fluctuations, and mean components. The equations are 'short' time averaged over a time interval long enough to average the higher frequency fluctuations, but short enough so that the lower frequency fluctuations may be approximated as constant over the interval. The resulting equations are then separated into time-dependent and time-independent equations. However, since this study is primarily concerned with investigating the possible causes of the rapid acceleration of the inner region of the boundary layer downstream of reattachment, and it is believed that this is primarily due to the large-scale velocity and pressure fluctuations, lower frequency fluctuations of temperature are not considered. Furthermore, the so called Morkovin hypothesis is invoked for the small-scale, higher frequency random turbulence, so that density fluctuations are not considered. Therefore, the small scale turbulence is modeled with a zero-equation incompressible turbulence model. After time averaging, time-independent equations result which contain the usual Reynolds stresses, plus additional 'source' terms due to the large-scale unsteadiness. Additionally, a time-dependent momentum equation is obtained which describes the large-scale unsteadiness. The phenomenological model appears as a velocity boundary condition and a forcing function to this equation. An approximate form of the time-dependent equation is solved and analytical solutions are found that are used to calculate the 'source' terms in the time-independent equations. It is shown that by including the effect of the large-scale unsteadiness, improved predictions of experimental values are obtained. Furthermore, this provides a possible explanation for the rapid acceleration of the inner region of the boundary layer downstream of reattachment.

AN OSCILLATING THREE-DIMENSIONAL WING EXPERIMENT: COMPRESSIBILITY, SWEEP, RATE, WAVEFORM, AND GEOMETRY EFFECTS ON UNSTEADY SEPARATION AND DYNAMIC STALL Final Report, Apr. 1989 - Nov. 1992
Peter F. Lorber, Franklin O. Carta, and Alfred F. Covino, Jr. 30 Nov. 1992 187 p
(Contract DAAL03-89-C-0013)
(AD-A260530; UTRC/R92-958325-6; ARO-26631.8-EG) Avail: CASI HC A09/MF A02

Experimental measurements of the unsteady separation and dynamic stall process on an oscillating three-dimensional wing are reported. The experiment was conducted at Mach numbers of 0.2-0.6, Reynolds numbers of 2-6 million, and sweep angles of 0, 15, and 30 deg. At low Mach number, as angle of attack is increased the location of transition to turbulence moves forward, the turbulent boundary layer separates near the leading edge, and a strong stall vortex is formed. At higher Mach number, compressibility causes formation of a shock, an earlier, more gradual separation, and reduced unsteady loads. Unsteady tip loads at 0 sweep are increased by the growth of a strong tip vortex. This effect is lessened by sweep-back and compressibility, and enhanced by replacing the round tip cap with a flat tip. Away from the tip, sweep effects on loads are well represented by the swept infinite wing normalization until stall. After stall, vortex propagation patterns are highly dependent on sweep and spanwise position. Sinusoidal and constant pitch rate ramp motions show similar behavior. There is significant hysteresis in both the transition/relaminarization and the separation/reattachment processes. For small amplitude motions simulating stall flutter, substantial regions of negative aerodynamic damping were found -at all studied Mach numbers, sweep angles, and reduced frequencies. The near-simultaneous stall along the span of the swept wing strengthens the resulting instability. An empirical representation of the damping characteristics was developed. GRA

AN INVESTIGATION OF THE FUNDAMENTAL CAUSE OF ASYMMETRIC SEPARATED FLOW Final Report, 1 Apr. 1991 - 30 Jun. 1992
F. Marconi Oct. 1992 49 p
(Contract DAAL03-91-C-0013)
(AD-A260296; ARO-28252.1-EG) Avail: CASI HC A03/MF A01

The cause of the phenomenon of steady asymmetric flow on cones at moderately high angles of attack is discussed. At very high angles of attack, the flow will become unsteady with a Karman vortex street being shed downstream. This second phenomenon was not considered. The investigation used computational fluid dynamics as a tool to uncover the fundamental cause of asymmetric separated flows. The appearance of new flow features as the critical angle of attack was approached was studied in detail. Isolating asymmetric disturbances to specific portions of the flow was also attempted. The stability of the symmetric flow above the critical angle of attack was investigated analytically. The transition of the flow from symmetric to asymmetric as the computation was continued was studied in detail. All of these studies indicated that the interaction of the vortices in the cross flow plane results in an instability in the symmetric flow. In addition, the interaction between the vortices seems to be somewhat global in nature. GRA

INVESTIGATION OF AEROTHERMODYNAMICS AND OPTICAL RADIATION IN THE AFE HYPERSONIC FLOW FIELD Final Technical Report, 1 Dec. 1989 - 31 Jan. 1993
Giusseppe Palumbo, Roger A. Craig, and William C. Davy 16 Mar. 1993 24 p

(Contract NCC2-653)
(NASA-CR-192844; NAS 1.26:192844) Avail: CASI HC A03/MF A01

Research for the radiation experiments on the Aeroassist Flight Experiment (AFE) was performed to obtain a data base for development of engineering requirements for aerobrakes. Due to funding restrictions, the necessary Aerobrake design data were obtained from ground based experiments, specifically arc-jet wind tunnels. Except for the instrument windows, final development of the AFE radiometers was completed. Window definition included several designs to be flight validated in arc-jets. This work was completed, and successful designs have evolved which will yield full scientific return from the flight experiment. The theoretical work includes final code development to describe the spacecraft environment to support instrument definition, optical radiation codes that operate at significantly improved speeds, and calculation of radiation forebody loads and effects on experiment objectives for varying AFE weights and trajectories. Furthermore, radiant flux vectors at the AFE base were predicted to be used for afterbody instrument definition. The Vacuum Ultraviolet Experiment for the Arc-Jet was completed, and arc-jet experiment conditions and experiment objectives were refined to incorporate the most current thinking. Ballistic range experiments were completed. Several shadowgraphs indicating corner turning angles and waviness structures were obtained, and the results were used to estimate the compression region location for the AFE flight. The waviness measured has helped to model the temporal variations of wake radiation for purposes of defining radiometers to measure the energy content of wake dynamics. Author (revised)

LOW-SPEED WIND TUNNEL STUDY OF THE DIRECT LIFT AND DIRECT SIDE-FORCE CHARACTERISTICS OF A JOINED-WING AIRPLANE
T. Fujita, A. Iwasaki, H. Fujieda, and N. Takizawa Mar. 1992 29 p
(DE93-767971; NAL-TR-1142) Avail: CASI HC A03/MF A01

A diamond joined-wing airplane having wings with a sweepback angle and a dihedral angle linked with horizontal tails (rear wings) with a sweepforward angle and a cathedral angle can control lift and side force directly by operating combinedly the wing fins and the horizontal tail fins. If this control method can be used in an aircraft making a low-speed landing in a sudden gust or side-wind condition, the safety could be improved largely. This paper describes a low-speed wind tunnel test carried out on diamond joined-wing airplane models in four variations each having different area ratio between horizontal tails and wings. The experiment was conducted with the model plane fitted on three balance stanchions in the wind tunnel and subjected to a test wind velocity of 30 m/s. Investigations were given on the effect of the area of the fins and the horizontal tails on directly controlling the lift and side force. As a result, it was verified that the lift and side force can be controlled by operating properly each fin on the wings and the horizontal tails. DOE

An experimental investigation was conducted in the 14- by 22-Foot Supersonic Tunnel at the NASA Langley Research Center to measure the inflow into a scale model helicopter rotor in forward flight (mu = 0.23). The measurements were made with a two-component Laser Velocimeter (LV) 0.50 chord above the plane formed by the path of the rotor tips (tip-path-plane). A conditional sampling technique was employed to determine the position of the rotor at the time that each velocity measurement was made so that the azimuthal fluctuations in velocity could be determined. Measurements were made at a total of 178 separate locations in order to clearly define the inflow character. The mean and standard deviation of the induced inflow ratios and the azimuthally dependent induced inflow ratios are included on 5.25 flexible disk in the pocket on the inside of the rear cover of this report. These data are presented without analysis. Author

An Advanced Lightweight Rotor (LAR) model was tested in high speed forward flight, mu = 0.37, at the 14- by 22-Foot Subsonic Tunnel at NASA LaRC. The pressure instrumented rotor, provided by Bell Helicopter, was a four-bladed, Mach-scaled, bearingless, soft-in-plane design. Rotor performance data was required from Bell's Powered Force Model (PFM) test stand, and the blade airfoils were obtained using 92 unsteady pressure transducers. A two-component laser velocimeter was used to obtain azimuthally dependent velocities in the inflow region and in the wake of the rotor. Data are presented here without analysis. To facilitate the use of the data sets, they are also provided on a 720 Kbyte 3 1/2-inch floppy disk in Microsoft Corporation MS-DOS format. The disk contains velocity time history data and blade pressure time history data. Author (revised)

THE ROLE OF UNIVERSITY RESEARCH IN AVIATION SAFETY AND COMPETITIVENESS: TESTIMONY TO THE US CONGRESS

William H. Wentz, Jr. Feb. 1991 28 p

(NIAR-92-3) Avail: CASI HC A03/MF A01

Presented here are the written and oral testimony of the Executive Director of the National Institute for Aviation Research as it was given before the U.S. House of Representatives Committee on Science, Space, and Technology, Subcommittee on Technology and Competitiveness. Reasons for, and returns on, investment in university-based aviation research are discussed. Some specific activities at Wichita State University that were funded by the Federal Aviation Administration (FAA) include research on crashworthiness, stall-spin safety, electro-impulse-de-icing, the reliability of computer software used in aircraft, structural integrity, aging aircraft, human factors, advanced cockpits, propulsion and fuel systems, atmospheric hazards, flight safety, and other mostly safety-related aviation subjects. Wichita State University has conducted a number of workshops and seminars with the FAA, established a cooperative educational program with the FAA Technical Center, and participated in their Summer Faculty Research program. Barriers to innovation and competitiveness, and examples of

successful research, development, and use of new information and technology are also given, as well as suggestions for improving aviation safety and competitiveness. CASI

OPTIONS OF AIR TRAFFIC DISTRIBUTION IN THE BERLIN REGION (GERMANY) [MOEGLICHKEITEN EINER AUFTEILUNG DES LUFTVERKEHRS AUF DIE FLUGHAEFEN DER REGION BERLIN]
Dieter Wilken, Stefan Beyhoff, and Volker Warlitzer Oct. 1991 142 p In GERMAN
(Contract BMV-FE-L-7/90-50096/90)
(DLR-FB-91-37; ETN-93-91926) Avail: CASI HC A07/MF A02; DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

Policy options for distributing air traffic between Berlin airports are studied. Such traffic distribution might be necessary as sufficient capacity will not be available in the foreseeable future to handle the growing air transport demand by a single Berlin airport. The study proceeds from a set of basic assumptions including the objectives in transport and environmental politics of the relevant political bodies, the air transport forecast for Berlin, and the development of airport capacities. Seven policy options are discussed and analyzed with a view to their application in the case of Berlin. The final policy advice calls for a market segmentation ruling with a continued application of IATA scheduling prodedures. ESA

THE GENERATION OF CARBON MONOXIDE IN COMPARTMENT FIRES Ph.D. Thesis
Daniel T. Gottuk 1992 261 p
Avail: Univ. Microfilms Order No. DA9301010

For the purpose of fire analysis and fire safety engineering, the development of empirical correlations for major species yields in compartment fires has become an important priority due to the inability to calculate these quantities from first principles. Studies of simplified upper layer environments have shown that major species production rates can be correlated with the equivalence ratio in what is known as the Global Equivalence Ratio concept (GER). Due to the simplification in these past experiments, it was not known if the GER concept was valid for compartment fires. Therefore, there was a need to determine if correlations existed between major species yields and the equivalence ratio for actual compartment fires. Since the flow of toxic gases from a room poses a hazard to building occupants, it was also important to determine if correlations for CO yield outside of a compartment on fire exist, particularly when external burning occurs. A 2.2 cu m test compartment was used to investigate the burning of four fuels (hexane, PMMA, spruce and flexible polyurethane foam) in compartment fires. The test compartment was specially designed with a two-ventilation path system which allowed the direct measurement of the plume equivalence ratio (the ratio of the fuel volatilization rate to the air entrainment rate normalized by the stoichiometric fuel-to-air ratio). Empirical correlations between the upper layer yield of major species and the plume equivalence ratio were shown to exist. The results reveal the production of CO is primarily dependent on the compartment flow dynamics (i.e., the equivalence ratio) and upper layer temperature. A chemical kinetics study indicated that increased compartment temperature affects upper layer species yields in two ways: (1) the generation of species in the plume is changed and (2) oxidation of post-flame gases in the layer is affected. The correlations developed in the compartment fires were qualitatively similar to those developed by Beyler for simplified upper layer environments. However, quantitative differences existed and are explained by the temperature effect. The species yields downstream of hexane compartment fires were investigated and compared to upper layer yields. Results showed that downstream CO yields can be correlated to the plume equivalence ratio when taking into account the occurrence of external burning. When sustained external burning occurred for equivalence ratios greater than 1.7, downstream CO yields were reduced to 10 to 25 percent of the upper layer value. Results are very encouraging in indicating that an ignition criterion based on lean flammability limits is useful in predicting the flammability of upper layer gases in compartment fires. An ignition index value of 1.3 indicated the occurrence of sustained external burning and, thus, a reduction of CO, for the hexane fires studied. Dissert. Abstr.

SAFETY STUDY: ALCOHOL AND OTHER DRUG INVOLVEMENT IN FATAL GENERAL AVIATION ACCIDENTS, 1983 THROUGH 1988
14 Oct. 1992 169 p
(PB92-917008; NTSB/SS-92/03) Avail: CASI HC A08/MF A02

The Safety Board conducted this study to examine alcohol and other drug involvement in fatal general aviation accidents that occurred from 1983 through 1988 and to compare the level of alcohol-involved accidents with the level documented in its 1984 statistical review of alcohol-involved aviation accidents that occurred from 1975 through 1981. For general aviation accidents that were fatal to the pilot-in-command, comparisons are made for two accident groups in terms of accident characteristics, flight conditions, pilot-in-command characteristics, and causes and factors. The alcohol-involved group consists of accidents in which alcohol was cited by the Safety Board as a cause or factor; the second group consists of accidents in which alcohol or other drugs were not cited as a cause or factor. Although the study briefly reviews accidents that were fatal to the pilot-in-command and in which drugs other than alcohol were cited as a cause or factor, the data are too limited for a comparative analysis to the alcohol-involved accidents or to accidents in which alcohol or other drugs were not cited. AIRCRAFT ACCIDENT REPORT: UNITED AIRLINES FLIGHT 585, BOEING 737-291, N999UA, UNCONTROLLED COLLISION WITH TERRAIN FOR UNDETERMINED REASONS, 4 MILES SOUTH OF COLORADO SPRINGS MUNICIPAL AIRPORT, COLORADO SPRINGS, COLORADO, 3 MARCH 1991
8 Dec. 1992 168 p
(PB92-910407; NTSB/AAR-92/06) Avail: CASI HC A08/MF A02

This report documents the inexplicable loss of United Airlines flight 585, a Boeing 737-291, after the airplane had completed its turn onto the final approach course to runway 35 at Colorado Springs Municipal Airport, Colorado Springs, Colorado, on 3 Mar. 1991. The safety issues discussed in the report are the potential meteorological hazards to airplanes in the area of Colorado Springs, potential airplane or systems anomalies that could have precipitated a loss of control, and the design of the main rudder power control unit servo valve that could present significant flight control difficulties under certain circumstances. Recommendations concerning these issues were addressed to the Federal Aviation Administration. Derived from text

MODELING THE HEAT RELEASE RATE OF AIRCRAFT CABIN PANELS Final Report
W. J. Parker and R. Filipczak (Federal Aviation Administration, Atlantic City, NJ.) Feb. 1993 52 p
(Contract DTFA03-87-A-0005)
(DOT/FAA/CT-92/3) Avail: CASI HC A04/MF A01

A computer model was developed to calculate the heat release rate of aircraft cabin composite panels based on the panel's thermophysical, chemical, and geometric properties. The model calculates the temperature through the panel as a function of time and uses this along with measured kinetic constants to deduce mass loss rate which is multiplied by the heat of combustion of the volatiles. The calculated results are in general agreement with the measured heat release obtained from the Ohio State University (OSU) calorimeter. Author

THE ANNUAL PROBABILITY OF AN AIRCRAFT CRASH ON THE US DEPARTMENT OF ENERGY RESERVATION IN OAK RIDGE, TENNESSEE
R. S. Seigler and L. J. Luttrell Nov. 1992 136 p
(Contract DE-AC05-84OR-21400)
(DE93-005171; ORNL/ENG/TM-36) Avail: CASI HC A07/MF A02

Aircraft hazards were evaluated to determine the total annual probability of an aircraft crash occurring at any structure located on the U.S. Department of Energy (DOE) reservation in Oak Ridge, Tennessee. This report documents the use of an accepted methodology for calculating the probability of an aircraft crash as applied to the three Oak Ridge plant sites including the adjoining facilities. Based on the data contained herein, the evaluation concluded that the probability of an aircraft crash occurrence at a single facility is generally considered 'not credible' as defined in DOE/OR-901. Additionally, reevaluation of probabilities would be necessary if significant changes were made to local air traffic. The probability of an aircraft crash could increase as a result of the opening of any new airport or heliport in the vicinity; a greater volume of air traffic from McGhee Tyson airport in Knoxville, should the airport status change from feeder airport to hub airport; the rerouting of commercial and/or military flights at the McGhee Tyson airport; and finally, a change in direction or the addition of a federal airway. At one time, DOE planned to establish a zone of prohibited airspace over the Y-12 plant; if the plans are enacted in the future, the probability of an aircraft crash at the Y-12 plant could decrease. Pilots since have been voluntarily requested not to fly below 3000 feet over the Y-12 plant. Also, the Federal Aviation Administration plans to reroute air traffic in the spring of 1993 on federal airway V16. However, the section of V16 which traverses the three plant sites and five adjoining facilities will not be altered. If this plan is implemented, the air traffic over the Oak Ridge facilities would not be affected significantly, and the probability of an aircraft crash as determined herein would be unchanged. DOE

A ground proximity warning system for aircraft is provided which has enhanced warning capability when aircraft performance is degraded due to such factors as wind shear, improper landing configuration, insufficient engine thrust, instrument errors, and degraded lift. According to the invention, the warning envelope of Modes 1 and 3 are extended to within 5 ft. of the ground. Radio altitude rate and barometric altitude rate signals are combined to provide a computed altitude rate signal that is accurate near the ground for use as an input to Modes 1 and 3. The system provides flight path deviation warning utilizing a measure of flight path and aircraft altitude. A means for generating a warning when the aircraft pitch is below a predetermined value after rotation is also included, as well as an output indicating that additional aircraft performance is available. Angle of attack is compared to stall angle of attack to generate an indication that angle of attack should be increased. A pilot indication to apply additional thrust can also be provided. CISTI

A fire protection system is provided for an aircraft of the type having an onboard water supply system. The system comprises a plurality of spray nozzles dispersed throughout the passenger cabin, a plurality of distribution conduits interconnecting those nozzles, means for selectively connecting those conduits to the aircraft onboard water supply system, and means for optionally connecting those conduits to a source of pressurized water external to the aircraft. The external source connection means is positioned outside the aircraft so as to be accessible to fire fighting personnel outside the aircraft regardless of the aircraft's orientation. Preferably, the distribution conduits are configured to supply each of the plurality of spray nozzles along at least two alternate flow paths so that a redundancy is achieved. It is also preferred that the fire protection system includes means for limiting the flow of water in the distribution conduits in the event of a rupture of one of the conduits upstream of one or more of the plurality of spray nozzles. The Cooperative Air Traffic Management Concept (CATMAC) is considered, in the framework of the German organization for flight safety. The improvement of the coordination between onboard/ground and aircraft/flight safety is outlined. The technical prerequisites are given. Terrain Referenced Information and Guidance Systems (TRIGS) is shown to contribute as an aircraft oriented landing area guiding system to the required increase of the system capacity. General aspects are considered, such as the reduction of workload in the cockpit, the safety increase in air and on the ground, the reduction of delays, and collision avoidance. ESA

SOLUTION TO A MULTICRITERIA AIRCRAFT ROUTING PROBLEM UTILIZING PARALLEL SEARCH TECHNIQUES M.S. Thesis
James J. Grimm, II Dec. 1992 248 p
(AD-A259293; AFIT/GCE/ENG/92D-04) Avail: CASI HC A11/MF A03

Pilots select routes based on factors such as threats, fuel, time on target, distance, and refueling points. This is a time consuming task. This thesis presents the software engineering synthesis of a software tool, based on a parallelized A* search algorithm, to select routes. For simplicity only threats and distance are used. A centralized open list is used with one processor managing the list while the other processors perform the node expansions. This decomposition result in a dynamically load balanced system. A number of parameters are changed to study their impact on the execution time. The use of a branch and bound technique and its impact on the execution time is studied. Other parameters examined are the size of the supercomputer and granularity of the algorithm. It is important to match the software granularity to the architecture to ensure maximum utilization of the supercomputer and minimize execution time. Tests were run on both an iPSC/2 and iPSC/860 to determine the effects of the architecture upon the execution time. In conjunction with execution time, the efficient usage of the parallel computer was also examined. GRA

Advanced guidance, control and navigation systems are becoming more functional and integrated. This paper describes Canadian experience in the development and applications of Integrated and Multi-function Navigation Systems. The emphasis is on the development of two distinct mission-specific inertially based integrated navigation systems. In particular, in a high risk development project such as the Synthetic Aperture Radar Motion Compensation System, the special attention given to the detailed assessment of key error sources and a well-planned sequence of simulation, development and flight test evaluation are essential to the success of the project. For Multifunctional inertially-based systems, the hardware design emphasis should be on IMU architectures that minimize both the acquisition and life-cycle cost, while the software design emphasis should be on practical and efficient FDIR schemes. Some comments were also offered on the trends of GPS related future applications. Author

Several recent technological developments (including the advent of GPS and the virtual explosion of computational capability) offer unprecedented opportunities for radically different approaches to providing weapon system capabilities. In the past high-rate raw sensor data would have to be sampled, or significantly pre-processed in a separate (dedicated) computer, before such data could be used within the constraints of a real time weapon system application. During such sampling/pre-processing much of the information content could be lost. The current computational capability explosion now permits highly complex algorithmic solutions to be executed within real time. Such computational capabilities within an integrated avionics architecture offer opportunities for maximum rate fusion of all raw signals directly from the sensors, where they are generated, with little or no information loss. As an example, when unfiltered GPS information is directly/optimally combined at maximum rate with inertial data, not only is the navigation accuracy increased, but effective susceptibility to GPS signal dropout/jamming is significantly reduced. Additionally, the resultant highly precise GPS/INS position, velocity, attitude, and time information can serve as a common integrating agent for combining the information from a variety of other mission sensors and communication devices. A system engineering process is required to systematically explore and exploit the yet untapped opportunities presented by these technological advancements. The essential ingredients of this process are a system level perspective, sound modeling and simulation, and the application of analytic tools. Author

In the 1980's, Ring Laser Gyroscopes (RLG) displaced the mechanical (spinning wheel) gyroscope as the angular sensor of choice for navigation. While the RLG remains the standard navigation grade instrument, several other optical gyroscopes have recently appeared. The multi oscillator (or four-mode gyro) represents a new generation in laser gyroscopes. Systems based on this technology are now being delivered for use on commercial and military aircraft. Another optical sensor, the fiber optic gyroscope (FOG) has been incorporated in inertial measurement units (IMU) and proved itself capable of AHRS (attitude and heading reference system) accuracy. This gyroscope should find many applications in aided navigation systems. Integrated FOG/GPS systems appear attractive as low cost navigators. This paper addresses technology involved in these optical gyroscopes and discusses their advantages and disadvantages in relation to present and future applications. Author

The SEXTANT Avionic company possesses a large spectrum of accelerometers for the different applications of Navigation. Since 1980, a constant concern about their adequacy to meet the need has led SEXTANT Avionic to develop micro-machined captors and accelerometers in particular. Many types of materials have been used and we expose the reasons for the choice of silicon in accelerometers destined for AHRS. The architecture of the accelerometer, the technologies used, and the functional modes are described. Then the actual performances of the different types of silicon accelerometers are explained, as well as their domain of application. In conclusion, perspectives of a longer term are given. Author

ULISS NG is an Inertia-GPS unit and an interesting example of INS/GPS synergy and performance/cost trade-off. It belongs to the ULISS family of INS already fitted to a number of different aircraft. Its miniaturized code twelve channel embedded receiver, with its RF and digital modules, totals 0.7, 1, 7 kg and 12 W. Its parallel tracking maximizes navigation continuity, smoothness, accuracy and minimizes reaction time and oscillator size. The tight Inertia-GPS coupling, i.e., tight inertial aiding and tight hybrid navigation Kalman filter, has been designed to favor operational capabilities, performance and solution stability. Four versions of the SAGEM embedded GPS receiver have been developed C/A-SPS, C/A-SA-PPS and P(Y)L1 and P(Y)L1/L2. The P code version is presented in the paper. Flight tests are being conducted in a Mirage 3 at the French Official Flight Test Center of Bretigny starting in May. Author

RETROFITTING OF GPS INTO EXISTING NAVIGATION SUITES

D. I. Callender and N. F. Watson *In* AGARD, Integrated and Multi-Function Navigation Nov. 1992 18 p (For primary document see N93-22780 08-04)

Copyright Avail: CASI HC A03/MF A02

As GPS signal availability reaches operationally useful levels, and in particular following experience of its usefulness in the Gulf operations, widespread requirements are beginning to arise for the incorporation of GPS into existing combat aircraft. A considerable amount of study and development work has been carried out by GEC Ferranti to investigate different approaches to integrating GPS into existing navigation systems with the minimum impact on installation, interfacing and operating procedures. This paper describes some different approaches to integrating GPS together with their relative merits and deficiencies. Two practical systems are described in detail and some simulation and trials results are presented together with some aspects of the GPS integration which will form the basis of future development work. Combined Satellite and Inertial Navigation Systems can achieve extremely high positioning accuracies in the sub meter range even in the dynamic environment of aircraft. This paper presents the concept of the 'Integrated Navigation System' developed at the Institute of Flight Guidance using coupled satellite and inertial sensors. Flight test results are shown, which demonstrate that this system has the potential to achieve the accuracy requirements according to ICAO CAT 3 for high precision approaches even under bad weather conditions. Algorithms are described for integration of Differential Global Positioning System (DGPS) data with Inertial Navigation System (INS) data to provide an integrated DGPS/INS navigation system. The objective is to establish the benefits that can be achieved through various levels of integration of DGPS with INS for precision navigation. An eight state Kalman filter integration was implemented in real-time on a twin turbo-prop transport aircraft to evaluate system performance during terminal approach and landing operations. A fully integrated DGPS/INS system is also presented which models accelerometer and rate-gyro measurement errors plus position, velocity, and attitude errors. The fully integrated system was implemented off-line using range-domain (seventeen-state) and position domain (fifteen-state) Kalman filters. Both filter integration approaches were evaluated using data collected during the flight test. Flight-test data consisted of measurements from a 5 channel Precision Code GPS receiver, a

strap-down Inertial Navigation Unit (INU), and GPS satellite differential range corrections from a ground reference station. The aircraft was laser tracked to determine its true position. Results indicate that there is no significant improvement in positioning accuracy with the higher levels of DGPS/INS integration. All three systems provided high-frequency (e.g., 20 Hz) estimates of position and velocity. The fully integrated system provided estimates of inertial sensor errors which may be used to improve INS navigation accuracy should GPS become unavailable, and improved estimates of acceleration, attitude, and body rates which can be used for guidance and control. Precision Code DGPS/INS positioning accuracy (root-mean-square) was 1.0 m cross-track and 3.0 m vertical. (This AGARDograph was sponsored by the Guidance and Control Panel.) Author

VISUAL AUTONOMOUS AUTOMATIC LANDING OF AIRPLANES

E. D. Dickmanns and F.-R. Schell *In* AGARD, Integrated and Multi-Function Navigation Nov. 1992 9 p (For primary document see N93-22780 08-04)

Copyright Avail: CASI HC A02/MF A02

A visual sensor data processing method has been developed and validated which allows to achieve on board autonomous landing approaches in the visual flight regime with computing technology available today; sensors are a video-camera, inertial gyros and an air velocity meter. The key feature of the method is the reconstruction and servo-maintained adjustment by prediction error feedback of an internal spatio-temporal model about the process to be controlled (4D approach). This encompasses both the ego motion state of the aircraft carrying the sensors and the relevant geometric properties of the runway and its spatial environment. The efficiency of the approach is proved both in a hardware-in-the-loop simulation and in real test-flights with a twinturbo-prop aircraft Do 128 of Dornier. For accuracy evaluation of the data gathered, the results of differential GPS and radio metric altitude measurements have been recorded simultaneously. Author

SCENE CORRELATION FOR INS AIDING IN FLIGHT-TEST SYSTEMS: RUNWAY-REFERENCED FLIGHT-TESTS WITH ON-BOARD SENSORS ONLY

B. Stieler and H.-U. Doehler *In* AGARD, Integrated and Multi-Function Navigation Nov. 1992 15 p (For primary document see N93-22780 08-04)

Copyright Avail: CASI HC A03/MF A02

Inertial and image-derived measurements for runway referenced flight path computations are investigated. They open the way for flight-tests without ground-based sensors and with a minimum of a priori knowledge or none at all about the runway position and direction in absolute coordinates. They are ideally suited for inspecting landing aids at congested civil airports, for instance. The investigations concentrate on the problems of the baroinertial and inertial altitude measurements, on the achievable accuracies of image-derived measurements and their integration with inertial measurements. It is shown that glide path and flight track accuracies in the order of 0.01 deg (1 sigma) should be achievable. Author

AN HIERARCHIC ALLIANCE OF FILTERS FOR FAULT TOLERANT NAVIGATION USING TWO INERTIAL SYSTEMS WITH AIDING SENSORS

J. Chris McMillan, Jeff S. Bird, and Dale A. G. Arden (Computers and Concepts Associates, Ontario.) *In* AGARD, Integrated and Multi-Function Navigation Nov. 1992 11 p (For primary document see N93-22780 08-04)

Copyright Avail: CASI HC A03/MF A02

A Dual Inertial Integrated Navigation System (DIINS) is being developed for the Canadian Navy to improve the navigational accuracy and reliability on ships which have two inertial navigators plus other aiding navigation systems and sensors such as GPS, Loran-C, Omega, Doppler Speed Log(s) and so on. The sensor integration architecture being proposed to optimally combine all navigation sensors on such a vessel is an 'hierarchic alliance' of Kalman filters, which is designed to allow sensitive error compensation as well as complete fault detection isolation and reconfiguration (FDIR). This architecture is ideally suited to central processing, can take advantage of parallel processing, and provides significant advantages over both the conventional unifilter approach and the 'federated' (or cascaded) filter approach. This hierarchic alliance consists of a specific set of optimal filters running in parallel, with each filter processing measurements from a different subset of the navigation sensors. These filters can be partially ordered so that primary and secondary filters can be defined. The primary filter(s) provide the optimal navigation solution, while the secondary filters provide uncorrupted backup in the event of a sensor fault. The primary motivating factor for this architecture is to provide optimal integration under all conditions, and in particular after the occurrence of subtle sensor faults which could not be immediately detected and which could therefore corrupt the primary filter(s). This alliance of filters can provide an uncorrupted optimal solution, since it can be configured so that there will always be a secondary filter which, at the time of failure, was running independently of the faulty sensor. This removes the usual need to 'back out' of a failure which was not immediately detected and thus substantially simplifies reconfiguration in response to such a failure. Another motivating factor for this architecture is that the partial independence of the parallel filters also facilitates the detection and isolation of sensor faults. This can be accomplished by multiple levels of statistical hypothesis testing on a set of parallel Kalman filters. Fault detection techniques used include the usual sensor data reasonableness and filter residual tests as well as a chi-square hypothesis testing technique applied to the state vectors, and inter-filter voting applied to the residuals test results. While this approach is computationally intensive, modern software techniques, and soon to be available processing power, are expected to make the real time implementation of this hierarchic alliance of filters quite practical. The system envisioned in this paper is being designed and built at the Defence Research Establishment Ottawa for the Canadian Navy and is expected to see initial real-time sea trials in 1993. Author

TOWARD ACHIEVING GLOBAL SOLE MEANS RADIONAVIGATION SYSTEMS

F. vanGraas *In* AGARD, Integrated and Multi-Function Navigation Nov. 1992 10 p (For primary document see N93-22780 08-04)

(Contract NGR-009-017; DTRS-57-87-C-00006)

Copyright Avail: CASI HC A02/MF A02

This paper briefly reviews tentative requirements for global, earth-referenced sole means of navigation systems with emphasis on integrity and availability. These requirements can be allocated to integrated navigation system architectures based on for instance GPS, GLONASS, VOR/DME, TACAN, Omega, Chayka, and Loran-C. Fault detection and isolation techniques (FDI) for integrated radio navigation systems are presented. The FDI algorithm provides a protection radius with a specified confidence level as a function of measurement geometry and algorithm requirements. This is followed by a case study of integrated GPS/Loran-C. Author

AIR TRAFFIC OPERATIONAL EVALUATION PLAN OF THE AUTOMATED SURFACE OBSERVING SYSTEM (ASOS) DISPLAYS

William Brenner, Chris Malitsky, Alanna Randazzo, and Bruce E. Ware Mar. 1993 36 p

(DOT/FAA/CT-TN92/36) Avail: CASI HC A03/MF A01

The Automated Surface Observing System (ASOS) is a weather collection and display system that will be installed in airport traffic control towers (ATCT). The system is being procured, installed, operated, and maintained by the National Weather Service (NWS) for the Federal Aviation Administration (FAA). The FAA's evaluation of the limited production ASOS system, which is being produced by SMI Corporation, is outlined. The FAA will conduct the evaluation of the limited production ASOS at seven air traffic field sites. Four of the named sites will be commissioned and the controller will be expected to use only that weather information generated by the ASOS and have the capability of inputting tower observed visibility when it falls below 4 miles. The remaining three sites will be noncommissioned sites where the controllers will undergo training and then evaluate the ASOS as they familiarize themselves with the system. Two of the three sites are also Limited Aviation Weather Reporting Station (LAWRS) which will permit the controller to augment the weather. Data will be collected via questionnaires completed by the air traffic control

specialists (ATCS) at the seven sites and analyzed by FAA Technical Center personnel. The results of the evaluation will be used for consideration in making changes to the ASOS system prior to full production.

STRUCTURE AND UTILITY OF BLIND SPEED INTERVALS ASSOCIATED WITH DOPPLER MEASUREMENTS OF RANGE RATE
Robert G. Mulholland Feb. 1993 62 p
(DOT/FAA/CT-TN92/27) Avail: CASI HC A04/MF A01

In the case of a coherent pulsed radar system, the time rate of change of the slant range of an aircraft may be determined to within an integer multiple of a known speed by measuring the pulse-to-pulse phase shift in the reflection of a transmitted wave train of electromagnetic energy. The integer multiplier is not necessarily a known, and lack of knowledge of the multiplier gives rise to an ambiguity. The ambiguity may be removed by appropriate processing of the pulse-to-pulse phase shift in the reflection of each of two wave trains that differ in one or both of the dimensions of interpulse period and carrier frequency. The processing is tantamount to a two-phase estimation procedure that is based on some properties of a collection of intervals of real numbers generated by two known speeds that serve as the moduli of distinct congruence relations. There is a connection between this procedure and the use of the Chinese remainder theorem in a multiple channel search system as a means for determining true slant range from several ambiguous range cell numbers. SIMULATION EVALUATION OF A LOW-ALTITUDE HELICOPTER FLIGHT GUIDANCE SYSTEM ADAPTED FOR A HELMET-MOUNTED DISPLAY
Harry N. Swenson, Richard E. Zelenka, Gordon H. Hardy, and Munro G. Dearing Feb. 1992 15 p
(RTOP 505-64-36)
(NASA-TM-103883; A-91219; NAS 1.15:103883) Avail: CASI HC A03/MF A01

A computer aiding concept for low-altitude helicopter flight was developed and evaluated in a real-time piloted simulation. The concept included an optimal control trajectory-generation algorithm based upon dynamic programming and a helmet-mounted display (HMD) presentation of a pathway-in-the-sky, a phantom aircraft, and flight-path vector/predictor guidance symbology. The trajectory-generation algorithm uses knowledge of the global mission requirements, a digital terrain map, aircraft performance capabilities, and advanced navigation information to determine a trajectory between mission way points that seeks valleys to minimize threat exposure. The pilot evaluation was conducted at NASA ARC moving base Vertical Motion Simulator (VMS) by pilots representing NASA, the U.S. Army, the Air Force, and the helicopter industry. The pilots manually tracked the trajectory generated by the algorithm utilizing the HMD symbology. The pilots were able to satisfactorily perform the tracking tasks while maintaining a high degree of awareness of the outside world. Author (revised)

PRECISE GPS-BASED TRACKING OF REMOTE SENSING SATELLITES Ph.D. Thesis
George Edward Powell, Jr. 1992 254 p
Avail: Univ. Microfilms Order No. DA9239337

The Global Positioning System (GPS), when fully deployed, will make possible an entirely new, geometric method of precise orbit determination. The geometric approach requires continuous collection of pseudorange measurements from at least four GPS satellites, and simultaneous acquisition of carrier phase data for pseudorange smoothing. While the GPS satellite orbits are determined utilizing the classical technique, within the geometric framework, no force model representation for the user satellite is required. However, in spite of the dynamic modeling related benefits of geometric tracking, this non-dynamic technique has its own measurement liabilities. The geometrically determined orbit is extremely sensitive to the observing geometry, clock errors, accuracy of the GPS ephemerides, and other measurement error sources such as signal multipath. Therefore, a hybrid, reduced-dynamic, method has been formulated which utilizes both measurement and dynamic information for the low satellite and weights the dynamic information relative to the geometric by compensating for process noise in the user satellite force mode. For sigma(i) approaches 0 and sigma(i) approaches infinity, where sigma(i) is the steady state uncertainty in the process noise for the i-th batch interval, the state of the user satellite with respect to a reference dynamic orbit is estimated purely dynamically or purely kinematically, respectively. The focus of this work is the determination of realistic orbit errors for GPS-based reduced-dynamic tracking of remote sensing satellites including the Earth Observing System (EOS), and the Ocean Topography Experiment (TOPEX). Comprehensive error models were developed for GPS-based tracking of TOPEX and EOS, and the Orbit Analysis SImulation Software (OASIS) was modified to simulate reduced-dynamic tracking of these satellites. The orbits of both the GPS and user satellites were estimated by processing undifferenced pseudorange and carrier phase information. Each transmitter and receiver clock was estimated as a white noise process noise parameter, and constant phase biases were computed for each transmitter-receiver pair per pass. Simulations were combined with consider covariance analysis to determine realistic TOPEX and EOS orbit errors. The reduced-dynamic tracking technique is examined from a dynamic perspective. The benefits of estimating clock parameters rather than eliminating them is discussed, especially as it relates to science support and intercontinental time transfer. Comparisons between dynamic, kinematic, and reduced-dynamic tracking and their associated performance are presented along with recommendations for future research. Dissert. Abstr.

The Aids to Navigation (ATON) Service Force Mix (SFM) 2000 Project is documented in a project overview and three separately bound volumes. This is volume 2. The project overview describes the purpose, approach, analysis, and results of the ATON SFM 2000 Project conducted by the USCG's Office of Navigation Safety and Waterway Services, Short Range Aids to Navigation Division. Volume 1, Development and Application of an Aids to Navigation Service Force Mix Decision Support System -- Final Report, documents the Volpe Center's analysis and development of the proposed replacement buoy tender fleet. The document describes current ATON operations, the concept, development, and operation of the Decision Support System (DSS); the data utilized by the DSS; validation of the DSS; and the proposed service force mix. Volume 2, Development and Application of an Aids to Navigation Service Force Mix Decision Support System -- Aid Assignments and Vessel Summary Reports, contains the DSS outputs associated with the findings of volume 1. Included are maps of the aid assignments for each vessel in both the current and proposed fleets and the associated one-page DSS summary printouts. Volume 3, Analysis of Multi-Mission Requirements and Development of Planning Factors for the Replacement Buoy Tender Fleet, documents the USCG's analysis and development of baseline multi-mission requirements of the replacement buoy tender fleet. The document describes buoy tender employment categories, historical tender employment data, the determination of underway hours per underway day, and projected impacts on multimission requirements resulting from alternative replacement fleet scenarios. The UK (United Kingdom) operational trial of TCAS 2 (Traffic Alert and Collision Avoidance System) is reported. Pretrial activities, data collection, and data analysis of airborne and ground radar recording are described. Events of interest are discussed. In TCAS terms, the quantity of data

collected during the trial is recognized to be comparatively small. Therefore, great care was taken in analyzing the results to try to avoid reading too much into the data. However, some significant and obvious trends are identified. The main features of the RA (Resolution Advisories) and TA (Traffic Advisories) data are described. The implications of TCAS as they may affect aircraft operators, UK ATC (Air Traffic Control) providers, and the Safety Group of the UK CAA (Civil Aviation Authority), are discussed. ESA

A study to define the operational requirements for rig identification signs and to propose a specification for the physical characteristics of a sign that will meet the operational requirements is presented. Design considerations of conspicuity, legibility, atmospheric attenuation, and other factors are described and discussed. The following are concluded: the pilot needs to see the rig identification aid at a range of 1250 m, by day and by night in visibilities down to 1250 m; the visual aid must be usable from a range of at least 900 m in the conditions given above; the signs currently displayed in rigs do not have sufficient luminance contrast; the contrast of the signs is very variable and dependent on environmental factors, as a result of which the useful range of the signs is also very variable and is often insufficient; and a sign board of the type currently in use will generally have a range less than the meteorological visibility, whereas a lit sign or beacon can have ranges in excess of the meteorological visibility. It is recommended that a new visual aid be specified. There are two options: either provide an identification beacon or develop a sign that has high contrast levels and adequate intensity to be legible at ranges in excess of 1000 m. Both options are technically feasible with current technology. The choice will primarily be a flight operations decision. In either case a prototype unit could be made available for trials during the first half of 1992. ESA

TESTING OF A GPS RECEIVER GLOBUS AN 2000 OF SEL: A STUDY OF SELECTIVE AVAILABILITY [FLUGERPROBUNG EINES GPS-EMPFAENGERS GLOBUS AN 2000DER FIRMA SEL: UNTERSUCHUNG VON 'SELECTIVE AVAILABILITY']
Hans-Peter Zenz Apr. 1992 40 p In GERMAN
(DLR-Mitt-92-07; ETN-93-93523) Avail: CASI HC A03/MF A01; DLR, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

The development of the GPS (Global Positioning System) has been continuing since the early seventies. During the test period from May to Jul. 1991 15 satellites were available for navigation purposes. For flight testing of the GPS, a GPS receiver (GLOBOS AN 2000) was mounted in an aircraft DO 228. The reference trajectories were determined by the Avonics Flight Evaluation System (AFES). The effect of 'selective availability' is shown in several test series. ESA

RELATIVE MOTION PINWHEEL Patent Application
Gary E. Streiner, inventor (to Navy) and Leslie P. Benda, inventor (to Navy) 5 Oct. 1992 13 p
(AD-D015629; US-Patent-Appl-SN-956327; Navy-Case-73981) Avail: CASI HC A03/MF A01

An apparatus for visualizing relative motion between two moving objects in a two-dimensional plane is provided. A planar base has a first compass rose printed thereon. Rotatably attached to the center of the first compass rose is a means for indicating a present course of a first moving object relative to a true bearing indication on the first compass rose. A second moving object assembly consists of a second compass rose rotatably attached to a means for indicating a present course of the second moving object relative to a true bearing indication on the second compass rose. The true bearing indication on the second compass rose is aligned to be equivalent to the true bearing indication on the first compass rose. Attached at the centers of the first and second compass roses is a means for tethering the second moving object assembly to the first compass rose. The second compass rose is free to rotate about its center and the second moving object assembly is free to revolve in a single-plane around the center of the first compass rose. The tethering means indicates a line of relative bearing from the first moving object to the second moving object. GRA

ANALYSIS OF DGPS MSK RECEIVERS IN A NON-GAUSIAN NOISE ENVIRONMENT
Benjamin Peterson, Keith Gross, Eric Chamberlin, Gregory Czerwonka, and William Jones Jan. 1993 12 p Presented at the Institute of Navigation National Technical Meeting, Washington, DC, 1993
(PB93-152866; USCGA-03-93) Avail: CASI HC A03/MF A01

A summary of ongoing research analyzing the atmospheric noise environment and various structures of minimum shift keying (MSK), receivers for differential GPS (DGPS) signals is presented. The purpose of the study is to assist in the Coast Guard's planning of the future DGPS broadcasting system in the U.S. The purpose is not necessarily to develop the optimum receiver but to determine how well typical high quality receivers operate in the atmospheric noise environment. The information is intended for use in the development of minimum performance specifications and in establishing parameters for determining coverage limits. Issues considered include how to define signal to noise ratio with noise probability density functions that suggest infinite noise variance, and comparative performance of various receiver structures, techniques for handling impulse noise, and bandwidths. AN IMPROVED CAMRAD MODEL FOR AEROELASTIC STABILITY ANALYSIS OF THE XV-15 WITH ADVANCED TECHNOLOGY BLADES
C. W. Acree, Jr. Mar. 1993 56 p
(RTOP 505-59-36)
(NASA-TM-4448; A-92022; NAS 1.15:4448) Avail: CASI HC A04/MF A01

In pursuit of higher performance, the XV-15 Tiltrotor Research Aircraft was modified by the installation of new composite rotor blades. Initial flights with the Advanced Technology Blades (ATB's) revealed excessive rotor control loads that were traced to a dynamic mismatch between the blades and the aircraft control system. The analytical models of both the blades and the mechanical controls were extensively revised for use by the CAMRAD computer program to better predict aeroelastic stability and loads. This report documents the most important revisions and discusses their effects on aeroelastic stability predictions for airplane-mode flight. The ATB's may be flown in several different configurations for research, including changes in blade sweep and tip twist. The effects on stability of 1 deg and 0 deg sweep are illustrated, as are those of twisted and zero-twist tips. This report also discusses the effects of stiffening the rotor control system, which was done by locking out lateral cyclic swashplate motion with shims. Author (revised)

JET ENGINE HOT PARTS IR ANALYSIS PROCEDURE (J-EIRP)
Joseph F. Baumeister Feb. 1993 20 p
(RTOP 505-62-00)
(NASA-TM-105914; E-7605; NAS 1.15:105914) Avail: CASI HC A03/MF A01

A thermal radiation analysis method called Jet Engine IR Analysis Procedure (J-EIRP) was developed to evaluate jet engine cavity hot parts source radiation. The objectives behind J-EIRP were to achieve the greatest accuracy in model representation and solution, while minimizing computer resources and computational time. The computer programs that comprise J-EIRP were selected on the basis of their performance, accuracy, and flexibility to solve both simple and complex problems. These programs were intended for use on a personal computer, but include the ability to solve large problems on a mainframe or supercomputer. J-EIRP also provides the user with a tool for developing thermal design experience and engineering judgment through analysis experimentation, while using minimal computer resources. A sample jet engine cavity analysis demonstrates the procedure and capabilities within J-EIRP, and is compared to a simplified method for approximating cavity radiation. The goal is to introduce the terminology and solution process used in J-EIRP and to provide insight into the radiation heat transfer principles used in this procedure. Author (revised)

MULTIDISCIPLINARY OPTIMIZATION OF A CONTROLLED SPACE STRUCTURE USING 150 DESIGN VARIABLES
Benjamin B. James Washington Feb. 1993 22 p
(Contract NAS1-19000; RTOP 506-43-41)
(NASA-CR-4502; NAS 1.26:4502) Avail: CASI HC A03/MF A01

A controls-structures interaction design method is presented. The method coordinates standard finite-element structural analysis, multivariable controls, and nonlinear programming codes and allows simultaneous optimization of the structure and control system of a spacecraft. Global sensitivity equations are used to account for coupling between the disciplines. Use of global sensitivity equations helps solve optimization problems that have a large number of design variables and a high degree of coupling between disciplines. The preliminary design of a generic geostationary platform is used to demonstrate the multidisciplinary optimization method. Design problems using 15, 63, and 150 design variables to optimize truss member sizes and feedback gain values are solved and the results are presented. The goal is to reduce the total mass of the structure and the vibration control system while satisfying constraints on vibration decay rate. Incorporation of the nonnegligible mass of actuators causes an essential coupling between structural design variables and control design variables. Author

CONTROL DESIGN VARIABLE LINKING FOR OPTIMIZATION OF STRUCTURAL/CONTROL SYSTEMS
Ik Min Jin and Lucien A. Schmit Washington Feb. 1993 185 p
(Grant NsG-1490; RTOP 505-63-10-02)
(NASA-CR-4493; NAS 1.26:4493) Avail: CASI HC A09/MF A02

A method is presented to integrate the design space of structural/control system optimization problems in the case of linear state feedback control. Conventional structural sizing variables and elements of the feedback gain matrix are both treated as strictly independent design variables in optimization by extending design variable linking concepts to the control gains. Several approximation concepts including new control design variable linking schemes are used to formulate the integrated structural/control optimization problem as a sequence of explicit nonlinear mathematical programming problems. Examples which involve a variety of behavior constraints, including constraints on dynamic stability, damped frequencies, control effort, peak transient displacement, acceleration, and control force limits, are effectively solved by using the method presented. DYNAMIC RESPONSE CHARACTERISTICS OF TWO TRANSPORT MODELS TESTED IN THE NATIONAL TRANSONIC FACILITY
Clarence P. Young, Jr. Feb. 1993 34 p
(Contract NCC1-141; RTOP 505-59-85-01)
(NASA-CR-191420; NAS 1.26:191420) Avail: CASI HC A03/MF A01

This paper documents recent experiences with measuring the dynamic response characteristics of a commercial transport and a military transport model during full scale Reynolds number tests in the National Transonic Facility. Both models were limited in angle of attack while testing at full scale Reynolds number and cruise Mach number due to pitch or stall buffet response. Roll buffet (wing buzz) was observed for both models at certain Mach numbers while testing at high Reynolds number. Roll buffet was more severe and more repeatable for the military transport model at cruise Mach number. Miniature strain-gage type accelerometers were used for the first time for obtaining dynamic data as a part of the continuing development of miniature dynamic measurements instrumentation for cryogenic applications. This paper presents the results of vibration measurements obtained for both the commercial and military transport models and documents the experience gained in the use of miniature strain gage type accelerometers. AN ANALYTIC MODELING AND SYSTEM IDENTIFICATION STUDY OF ROTOR/FUSELAGE DYNAMICS AT HOVER

Steven W. Hong (United Technologies Research Center, East Hartford, CT.) and H. C. Curtiss, Jr. 26 Feb. 1993 21 p Presented at Piloting Vertical Flight Aircraft: A Conference on Flying Qualities and Human Factors, San Francisco, CA, 1993

(Grant NAG2-561)

(NASA-CR-192303; NAS 1.26:192303) Avail: CASI HC A03/MF A01

A combination of analytic modeling and system identification methods have been used to develop an improved dynamic model describing the response of articulated rotor helicopters to control inputs. A high-order linearized model of coupled rotor/body dynamics including flap and lag degrees of freedom and inflow dynamics with literal coefficients is compared to flight test data from single rotor helicopters in the near hover trim condition. The identification problem was formulated using the maximum likelihood function in the time domain. The dynamic model with literal coefficients was used to generate the model states, and the model was parametrized in terms of physical constants of the aircraft rather than the stability derivatives resulting in a significant reduction in the number of quantities to be identified. The likelihood function was optimized using the genetic algorithm approach. This method proved highly effective in producing an estimated model from flight test data which included coupled fuselage/rotor dynamics. Using this approach it has been shown that blade flexibility is a significant contributing factor to the discrepancies between theory and experiment shown in previous studies. Addition of flexible modes, properly incorporating the constraint due to the lag dampers, results in excellent agreement between flight test and theory, especially in the high frequency range. (ETN-93-93696) Avail: CASI HC A03/MF A01

A report on the German Saenger spaceplane system is presented. Saenger must be able to carry payloads into space at a lower cost than that offered by the Ariane 5/Hermes system, and must also be a basis for hypersonic passenger transportation. The first concept, designated EHTV (Eurepean Hypersonic Transport Vehicle) is described. A discussion on Saenger versus the NASP (National Aero Space Plane) of NASA is included. ESA

A CONCEPTUAL DESIGN ANALYSIS OF AN AIR LAUNCHED ANTI-SATELLITE MISSILE SYSTEM M.S. Thesis

G. K. Wishart 1991 228 p

(ETN-93-93487) Copyright Avail: CASI HC A11/MF A03

A project to carry out a conceptual design study for an air launched missile system to intercept low Earth orbit reconnaissance satellites is presented. A historical review of U.S. and Soviet antisatellite programs is given. The target satellite is defined and the various methods of interception, using an air launched missile system, are considered. Using the calculated satellite parameters and assumed missile launch parameters, the missile performance criteria are developed in terms of missile range, weight, latax capability and velocity. Analysis tools developed during the project are used to assess the various design options in terms of missile performance and where possible an optimum design is proposed. The analysis covers the missile propulsion system, missile control, missile guidance and the need for and selection of a warhead. The proposed missile design and the major assumptions made during the analysis are validated. In particular, the assumption that drag could be neglected from the performance calculations is assessed using a specially developed missle trajectory analysis program. The results of the analysis are discussed, highlighting the problem areas encountered and suggesting areas for possible future work. ESA

REVIEW OF AERONAUTICAL FATIGUE INVESTIGATION ACTIVITIES DEVELOPED IN AERITALIA-GAT DURING THE PERIOD MAY 1987 - APRIL 1989

A. Minuto Apr. 1989 9 p Presented at 4th AIFA Meeting, Milan, Italy, 10-11 Apr. 1989

(ETN-93-93702) Avail: CASI HC A02/MF A01

A summary of the main activities of the Aeritalia GAT (Italian acronym for air transport group) in the field of aeronautical fatigue is presented. These include the following: fatigue tests for G222 Cargo door hooks; ATR 42/72 full scale (aircraft, horizontal tail, main landing gear and support, foreward/after entry door plug type, cockpit pressure, and carbon/epoxy pressure dome) tests; the MD-11 full scale winglet assembly fatigue test; and specimen fatigue tests (crack propagation, bonded structures, carbon/epoxy solid laminates, cold working effects on 7050-T73 material). CFD-BASED APPROXIMATION CONCEPTS FOR AERODYNAMIC DESIGN OPTIMIZATION WITH APPLICATION TO A 2-D SCRAMJET VEHICLE Ph.D. Thesis

Peter David McQuade 1992 103 p

Avail: Univ. Microfilms Order No. DA9239471

This dissertation investigates the application of approximation concepts to aerodynamic optimization. Such techniques, which are gaining popularity in structural optimization, offer the potential of providing the accuracy of a high-fidelity 'detailed' analysis model at greatly reduced computational cost. This is because the detailed model is used only to 'fine-tune' an approximate model which is then used in the optimizer. The test problem treated is the design optimization of a 2-D scramjet vehicle flying at Mach 6.0 at 30 km altitude. The objective function is net thrust. The following approximation concepts are used: the Taylor series approximation to wall pressures and inlet plane flow properties; and Haftka's Global-Local Approximation applied to the same variables. The performance of these techniques is compared to that for optimizing using CFD alone. Cost reductions are quantified. It is shown that modifications must be made to the formulation of the approximation concepts as they are used in structural optimization, due to the changing grid geometries required by the CFD solver. All correction factors for the approximation concept are applied not to the CFD grid points, but to a constant, dense, nondimensionalized 'correction point grid', which does not change as the CFD grid changes. It is also shown that, in areas where discontinuous phenomena are not important (such as the scramjet nozzle), the approximation concepts can be successfully used, after this modification is made. Optimizations of the nozzle region show that all the approximation concepts result in a 68 percent reduction in the number of calls to the CFD solver. In regions dominated by shock impingements (such as the forebody/inlet), it is found that approximation

concepts applied to point properties cannot be used as they currently are in structural optimization, due to the effects of shock movement during correction factor calculations, and due to artifacts of the CFD solver, such as shock smearing. In fact, even though the CFD and the (uncorrected) approximate models optimize to very nearly the same design, the Taylor series and GLA fail to do so. However, application of the GLA to the integrated objective function (net thrust) with zeroth-order correction factors, is unsuccessful. To lay the groundwork for future investigation, a method of improving the behavior of the point-property GLA in the presence of shock impingements is developed and tested. This involves using 'floating' pre- and post-shock coordinate systems for each wall surface. The result is a dramatic reduction in the erratic behavior of the GLA. This technique may form the basis of a generally-applicable GLA technique for aerodynamic optimization. Dissert. Abstr.

VULNERABILITY ASSESSMENT OF AIRCRAFT: A REVIEW OF THE DEPARTMENT OF DEFENSE LIVE FIRE TEST AND EVALUATION PROGRAM

1993 102 p

(PB93-149946) Copyright Avail: Issuing Activity

As a consequence of the reluctance by DOD to conduct realistic live fire tests on systems in development, Congress passed legislation in fiscal year 1987 that requires realistic vulnerability testing of covered weapon systems, including aircraft, before they can proceed beyond Low Rate Initial Production. The legislation is known as the Live Fire Test (LFT) Law. The realistic vulnerability tests mandated by the LFT Law must be conducted on the system, configured for combat, using weapons likely to be encountered in combat. A waiver from these mandated tests is possible if the Secretary of Defense certifies to Congress, prior to entry into engineering and manufacturing development, that such tests are unreasonably expensive and impractical. An alternate plan for assessing vulnerability must be submitted if a waiver to the mandated system tests is given. In an attempt to resolve the controversy regarding the law's requirements, and to obtain an independent opinion regarding the total vulnerability assessment process and the law's contribution to that process, the DDDR&E(T&E), now the Director, Test, and Evaluation, requested that the National Research Council (NRC) conduct a study of aircraft vulnerability assessment. The NRC appointed the Committee on Weapons Effects on Airborne Systems to conduct the study. The report is the result of the committee's deliberations. GRA

A SIMULATION OF THE BOEING B-747 AIRCRAFT

A. P. Oliva and M. V. Cook Jan. 1992 130 p

(Cranfield-Aero-9202; ISBN-1-871564453X; ETN-93-93554) Avail: CASI HC A07/MF A02; Cranfield Inst. of Technology, Coll. of Aeronautics, Cranfield, Bedford MK43 OAL, United Kingdom, HC

A computer simulation model of the Boeing B-747 aircraft intended for use as a general purpose tool for research into advanced flight control systems for civil aircraft is described. A previous model was adapted with little change and implemented in the Advanced Continuous Simulation Language (ACSL) for use on an appropriate personal computer. Three distinct computer models of the aircraft were produced: a decoupled linear longitudinal model; a decoupled linear lateral directional model; and a fully coupled nonlinear model. ESA

ANALYSIS OF A HIGH SPEED CIVIL TRANSPORT CONFIGURATION AT SUBSONIC FLOW CONDITIONS USING A NAVIER-STOKES SOLVER Final Report

Victor R. Lessard Washington Feb. 1993 41 p

(Contract NAS1-18585; RTOP 537-03-22-02)

(NASA-CR-4490; NAS 1.26:4490) Avail: CASI HC A03/MF A01

Computations of three dimensional vortical flows over a generic High Speed Civil Transport (HSCT) configuration with an aspect ratio of 3.04 are performed using a thin-layer Navier-Stokes solver. The HSCT cruise configuration is modeled without leading or trailing edge flap deflections and without engine nacelles. The flow conditions, which correspond to tests done in the NASA Langley 8-Foot Transonic Pressure Tunnel (TPT), are a subsonic Mach number of 0.3 and Reynolds number of 4.4 million for a range-of-attack (-.23 deg to 17.78 deg). The effects of the farfield boundary location with respect to the body are investigated. The boundary layer is assumed turbulent and simulated using an algebraic turbulence model. The key features of the vortices and their interactions are captured. Grid distribution in the vortex regions is critical for predicting the correct induced lift. Computed forces and surface pressures compare reasonably well with the experimental TPT data. Author (revised)

A TWO-DIMENSIONAL SPOILER OF ARBITRARY CHORDWISE POSITION IN A LOW SPEED FLOW Ph.D. Thesis

Paul G. Myers 1990 230 p

Avail: Univ. Microfilms Order No. BRDX97389

A study has been carried out at low speeds--with a typical Reynolds Number based on chord of 0.56 x 10(exp 6)--into the static characteristics of a nominally two-dimensional spoiler (to be precise, full span and fitted to a wing with large endplates). The spoiler was of height 0.08c (c being chord), at a selection of chordwise positions and at nominal spoiler deflections of 20 deg and 40 deg. This has helped to clarify the results from two complementary studies, each with a similar spoiler but capable of rapid deployment rates. The current study had the spoiler mounted at one of two chordwise positions: forward (at x/c = 0.15) and mid chord (at x/c = 0.50)--whereas a previous study was for a rear spoiler (at x/c = 0.70). Static and dynamic spoiler characteristics are strongly dependent on configuration--incidence (alpha), spoiler projected height and chordwise position--this set of three having a crucial role in determining whether the flow that separates from the spoiler free edge reattaches forward of the trailing edge or extends into the wake. Only the latter flow allows the spoiler to be fully effective. As regards static results, over the viable incidence range (chosen so that the spoiler is effective) a mid chord spoiler is almost equally effective at all alpha whereas a forward spoiler is most effective at high positive alpha and a rear spoiler is most effective at high negative alpha. Surprisingly, the contribution to lift spoiling from the surface opposite the spoiler is generally greater than that from the surface including the spoiler. A rapidly opening spoiler generates a spoiler starting vortex which may lead to a transient increase in lift when the ultimate quasi-steady change is a decrease. This is known as an adverse effect and is strongly dependent on spoiler chordwise location. The other possible transient feature observed is an overshoot during which the maximum recorded transient decrease in lift is much larger than the quasi-steady decrease. A rapidly closing spoiler causes a surge of higher pressure air to be dispelled in the flow direction and this may cause an adverse effect if the spoiler is located far enough forward. Aerodynamic performance is strongly dependent on the distance, d, from spoiler free edge to trailing edge. With U denoting freestream velocity and T the spoiler opening time, UT/d is a more useful parameter than UT/c in comparing spoilers of different chordwise locations. Dissert. Abstr.

MULTIOBJECTIVE OPTIMIZATION OF AEROSPACE STRUCTURES Final Report, 1 Jan. 1990 - 31 Dec. 1991

Ramana V. Grandhi and Geetha Bharatram Jul. 1992 130 p

(Contract F33615-88-C-3204)

(AD-A260433; WL-TR-92-3052) Avail: CASI HC A07/MF A02

This report presents the multiobjective optimization methodology suitable

to the preliminary design of large scale aircraft structures. The algorithm is based on generalized compound scaling techniques to reach the intersection of multiple functions. Multiobjective functions are treated similar to the behavior constraints by generating pseudo-targets on objectives. This algorithm is very efficient due to the fact that it does not solve many single objective optimization problems in reaching the Pareto set. The Pareto set gives several optimum solutions, and the designer has to use additional decision criteria in selecting the best design. In this work, a reliability index based concept is used as the decision criterion. System reliability of the Pareto designs is calculated-due to the random nature of material properties, fabrication tolerances, and service loads, where the random parameters influencing the design appear through their mean and covariance values. USE OF SYSTEM IDENTIFICATION TECHNIQUES FOR IMPROVING AIRFRAME FINITE ELEMENT MODELS USING TEST DATA Final Report
Sathya V. Hanagud, Weiyu Zhou, James I. Craig, and Neil J. Weston Mar. 1993 112 p
(Grant NAG1-1007)
(NASA-CR-192699; NAS 1.26:192699; E-16-A22) Avail: CASI HC A06/MF A02

A method for using system identification techniques to improve airframe finite element models using test data was developed and demonstrated. The method uses linear sensitivity matrices to relate changes in selected physical parameters to changes in the total system matrices. The values for these physical parameters were determined using constrained optimization with singular value decomposition. The method was confirmed using both simple and complex finite element models for which pseudo-experimental data was synthesized directly from the finite element model. The method was then applied to a real airframe model which incorporated all of the complexities and details of a large finite element model and for which extensive test data was available. The method was shown to work, and the differences between the identified model and the measured results were considered satisfactory. Author (revised)

AN EXPERIMENTAL INVESTIGATION OF SUBSONIC FLOW IN A TWO-DIMENSIONAL U-DUCT (Diskette Supplement)
Daryl J. Monson and H. Lee Seegmiller Jul. 1992 108 p Diskette supplement: IBM compatible 3.5-inch DSDD
(RTOP 505-59-53)
(NASA-TM-103931; A-92087; NAS 1.15:103931;
NONP-Suppl-DK-93-159802) Avail: Issuing Activity (Center for AeroSpace Information) HC/DK A13

An experimental study of the low speed internal flow in a two-dimensional strongly-curved U-duct was conducted in order to acquire fluid dynamic data suitable for evaluating numerical-flow codes. The measurements include surface oil-flow patterns, static pressure distributions obtained with an electronically scanned pressure system, mean and turbulent velocity profiles acquired with laser-Doppler velocimetry, and surface skin friction measured with a laser interferometer skin friction method. The tests were performed at an average Mach number of 0.1, and at Reynolds numbers (based on channel height) of 1 x 10(exp 5) and 1 x 10(exp 6). A high-aspect-ratio geometry together with sidewall boundary-layer suction panels was employed to minimize wall interference effects and obtain nominally two-dimensional flow data. Data files generated are included on a 3.5-inch low-density diskette. Author (revised)

A microwave powered aircraft is presented. This patent discusses a method for propelling the aircraft by means of microwave energy received by a rectenna. The rectenna is mounted on the underside of a relatively shallow body attached to the underside of the aircraft. The major dimensions of the body extend horizontally and its periphery is vertically curved so as to reduce turbulence in the airstream over the body during flight. The body is separate from the lifting means of the aircraft and is shaped to avoid generation of lift by the body. The lifting surfaces are comprised of wings located forward of the microwave receiving body, which may in that case serve as means for promoting longitudinal stability of the aircraft. The aircraft includes a fuselage with a movable canard located forward of the lifting surfaces, or conventional tail surfaces of the fuselage, for promoting longitudinal stability. A pylon of symmetrical airfoil cross-section is preferably mounted on the fuselage to support the wings. The pylon includes a flap at its trailing edge to cause a side force to act on the aircraft independently of the bank angle of the aircraft. The control of such a surface in conjunction with the aircraft's other control surfaces can produce turns with relatively small bank angles. Author (CISTI)

(NASA-TM-4463; H-1879; NAS 1.15:4463; AIAA Paper 92-4111) Avail: CASI HC A03/MF A01

Engineers at the NASA Dryden Flight Research Facility (NASA-Dryden) have conducted two flight research programs with lightweight, low-power miniaturized instrumentation systems built around commercial data loggers. One program quantified the performance of a radio-controlled model airplane. The other program was a laminar boundary-layer transition experiment on a manned sailplane. NASA-Dryden personnel's flight experience with the miniaturized instrumentation systems used on these two programs is reported. The data loggers, the sensors, and the hardware and software developed to complete the systems are described. How the systems were used is described and the challenges encountered to make them work are covered. Examples of raw data and derived results are shown as well. Finally, future plans for these systems are discussed. For some flight research applications where miniaturized instrumentation is a requirement, the authors conclude that commercially available data loggers and sensors are viable alternatives. In fact, the data loggers and sensors make it possible to gather research-quality data in a timely and cost-effective manner. Author (revised)

CONCEPTS FOR CONFORMAL AND BODY-AXIS ATTITUDE INFORMATION FOR SPATIAL AWARENESS PRESENTED IN A HELMET-MOUNTED DISPLAY
Denise R. Jones, Terence S. Abbott, and James R. Burley, II Washington Mar. 1993 11 p
(RTOP 505-68-30-09)
(NASA-TM-4438; L-17125; NAS 1.15:4438) Avail: CASI HC A03/MF A01

A piloted simulation study has been conducted to evaluate two methods of presenting attitude information in a helmet-mounted display (HMD) for spatial awareness in a fighter airplane. One method, the body-axis concept, displayed the information relative to the body axis of the airplane. The quantitative results of this study favored the body-axis concept. Although no statistically significant differences were noted for either the pilots' understanding of roll attitude or target position, the pilots made pitch judgment errors three times more often with the conformal display. The subjective results showed the body-axis display did not cause attitude confusion, a prior concern with this display. In the posttest comments, the pilots overwhelmingly selected the body-axis display as the display of choice. Author

A FULL-SCALE STOVL EJECTOR EXPERIMENT
Wendy S. Barankiewicz Feb. 1993 134 p
(RTOP 505-68-32)
(NASA-TM-106019; E-7433-1; NAS 1.15:106019) Avail: CASI HC A07/MF A02

The design and development of thrust augmenting short take-off and vertical landing (STOVL) ejectors has typically been an iterative process. In this investigation, static performance tests of a full-scale vertical lift ejector were performed at primary flow temperatures up to 1560 R (1100 F). Flow visualization (smoke generators, yarn tufts and paint dots) was used to assess inlet flowfield characteristics, especially around the primary nozzle and end plates. Performance calculations are presented for ambient temperatures close to 480 R (20 F) and 535 R (75 F) which simulate 'seasonal' aircraft operating conditions. Resulting thrust augmentation ratios are presented as functions of nozzle pressure ratio and temperature. Full-scale experimental tests such as this are expensive, and difficult to implement at engine exhaust temperatures. For this reason the utility of using similarity principles -- in particular, the Munk and Prim similarity principle for isentropic flow -- was explored. At different primary temperatures, exit pressure contours are compared for similarity. A nondimensional flow parameter is then shown to eliminate primary nozzle temperature dependence and verify similarity between the hot and cold flow experiments. Under the assumption that an appropriate similarity principle can be established, then properly chosen performance parameters should be similar for both hot flow and cold flow model tests. MATHEMATICAL RELATIONSHIP BETWEEN TWO SETS OF LASER ANEMOMETER MEASUREMENTS FOR RESOLVING THE TOTAL VELOCITY VECTOR
Albert K. Owen Mar. 1993 20 p
(DA Proj. 1L1-61102-AH-45)
(NASA-TM-105986; E-7511; NAS 1.15:105986; AVSCOM-92-C-038) Avail: CASI HC A03/MF A01

The mathematical relations between the measured velocity fields for the same compressor rotor flow field resolved by two fringe type laser anemometers at different observational locations are developed in this report. The relations allow the two sets of velocity measurements to be combined to produce a total velocity vector field for the compressor rotor. This report presents the derivation of the mathematical relations, beginning with the specification of the coordinate systems and the velocity projections in those coordinate systems. The vector projections are then transformed into a common coordinate system. The transformed vector coordinates are then combined to determine the total velocity vector. A numerical example showing the solution procedure is included. Author

A long-term goal of the Air Force is to develop near-stoichiometric gas turbine combustors that will burn broad-specification fuels, and have low maintenance and high durability. Towards meeting this goal, this program had two principal objectives: to design and conduct experiments that will establish a fundamental understanding of lean blowout (LBO), swirling flames, kinetically controlled combustion, and turbine blade cooling, and to provide

data sets for evaluating and refining computer models of gas turbine combustor. In this final report, we present the Combustion Data Sets that may be used by modelers in the industry and other laboratories for evaluating and refining computer models of gas turbine combustor. These data sets are for three different technical tasks: step combustor task, bluff body combustor task, and swirl combustor task. More exhaustive information is available in the individual papers listed in this report. All the data sets were prepared using Microsoft Excel V.4.0 for IBM PC-Compatible computers and are available on computer diskettes. GRA

Higher operating temperatures required for increased engine efficiency can be achieved by using ceramic materials for engine components. Ceramic turbine rotors are subject to the same limitations with regard to gas path efficiency as their superalloy predecessors. In this study, a modified frequency-modulation system is proposed for the measurement of blade tip clearance on ceramic rotors. It is expected to operate up to 1370 C (2500 F), the working temperature of present engines with ceramic turbine rotors. The design of the system addresses two special problems associated with nonmetallic blades: the capacitance is less than that of a metal blade and the effects of temperature may introduce uncertainty with regard to the blade tip material composition. To increase capacitance and stabilize the measurement, a small portion of the rotor is modified by the application of 5-micron-thick platinum films. The platinum surfaces on the probe electrodes and rotor that are exposed to the high-velocity gas stream are coated with an additional 10-micron-thick protective ceramic topcoat. A finite-element method is applied to calculate the capacitance as a function of clearance. Author

CONCEPTUAL DESIGN STUDY OF A VARIABLE CYCLE ENGINE FOR A SUPERSONIC BUSINESS JET M.S. Thesis

Luke Brown 1992 149 p

(ETN-93-93486) Avail: CASI HC A07/MF A02

The aim of this project was to produce an engine cycle for both subsonic and supersonic flight conditions that could be produced by the variation of bypass ratio. The basic aircraft and flight profiles are defined followed by the initial conditions of the engine. The starting point, the takeoff, subsonic cruise and supersonic cruise engine cycles are studied. For each of these conditions carpet plots are produced for a range of bypass ratios, turbine entry temperatures, and engine pressure ratios. A selection is made of the most suitable engine cycle for the takeoff condition taking into account jet velocity restrictions. A selection is also made of the most suitable engine cycle for the supersonic condition. Their compatibility was then studied. The results indicated that the two engine cycles were compatible and therefore could be produced by the same engine by the variation of the bypass ratio. The effect of the engine cycle selection on the dimensions of the engine are examined and a schematic diagram of the engine layout is produced. Methods of varying the engine cycle are discussed and compared with the results of this study. There are certain aspects of the engine design which are not entirely satisfactory. Methods by which the design might be improved are discussed. ESA

NEW APPROACHES FOR A SECOND GENERATION SUPERSONIC TRANSPORT PROPULSION SYSTEM

Pascal J. Senechal 1991 13 p Presented at 2nd International Aerospace Symposium, Tokyo, Japan, Feb. 1991

(DS-1934; ETN-93-93374) Avail: CASI HC A03/MF A01

Views on cruise Mach number, environmental issues, and relevant engine concepts proposed for a second generation SST (Supersonic Transport), from experience in the development, manufacture, and support of supersonic civil powerplants are presented. The flexibility of the variable cycle engine concepts in meeting the major environmental issues is discussed, and a technology acquisition plan is proposed. Confidence in the variability of a second generation SST is concluded from commercial supersonic operations and a demonstrated safety record. However, to meet noise requirements and future NO(x) standards, variable cycle engines and ultra low NO(x) emission combustor, which require a high effort in technology acquisition and will need demonstration before committing to a full scale development, must be developed. It is anticipated that this effort will lead to worldwide international cooperation. ESA

X RAY COMPUTED TOMOGRAPHY FOR WHOLE SYSTEM EVALUATION (SMALL ENGINES) Interim Report, Jun. 1990 - Feb. 1991

Alan R. Crews and Richard H. Bossi 31 May 1992 52 p

(Contract F33615-88-C-5404)

(AD-A259519; WL-TR-91-4109) Avail: CASI HC A04/MF A01

Under a preliminary testing task assignment of the Advanced Development of X-Ray Computed Tomography Application Program, computed tomography (CT) has been studied for its potential as an engineering analysis tool and an in-service nondestructive evaluation method for whole systems such as small jet engines. CT evaluation has been employed on small jet engines demonstrating its viability for assembly verification, dimensional profiles, and foreign object detection without disassembly. CT systems with energies of 400 kV, 2 MV, 2.5 MV, and 9 MV were used in the study. The sensitivity to feature details in complex systems, such as the jet engines, is improved with higher signal to noise for the same inherent resolution. For long metal paths, the highest energy available is preferred, however many of the 2 MV images showed good sensitivity to internal details, and even 400 kV can be usefully employed in some regions of an engine. The quantitative capability of CT to measure the relative x-ray linear attenuation coefficient and position of small volume elements in an object offers the potential to directly calculate the center-of-gravity (CG) of the object from the CT scan data. Results of CT tests on a test phantom indicates that under certain conditions CG calculations can be made for CT data with sensitivity on the order of 0.15 g-cm in aluminum at 3 cm radius. GRA

PROBLEMS ON NUMERICAL ANALYSIS RELATING TO GAS TURBINES

31 Mar. 1992 171 p In JAPANESE

(DE93-753796; ETDE/JP-mf-93753796) Avail: CASI HC A08/MF A02

At the beginning of CFD (Computational Fluid Dynamics) technology, the streamline curvature method was used for design and analysis of the whole system of turbines and compressors. On the contrary, in the cascade flow analysis method, the inviscid cascade analysis based on potentials or Eulerian equations is in a stage of adolescence. The recent three-dimensional viscous flow field analysis including turbulent flow, heat transfer and chemical reaction is in a stage of transfering to maturity. This analysis seems to be a numerical simulation system including flow, heat transfer, chemical reaction and structure strength in the future. In order to construct the design system by the numerical simulation technology, it is necessary for the simulation technology to be improved in stability, accuracy and calculation efficiency, to be established in reliability and to be validated through high-accurate experiments. The paper presents basic problems, application examples, problems to be pointed out and future issues of CFD technology and also refers to peripherally related technology indispensable to development of CFD and subjects and prospects for commercialization. MEASUREMENT AND PREDICTION OF TIP-CLEARANCE EFFECTS IN A LINEAR TURBINE CASCADE Ph.D. Thesis

Metin Ilbay Yaras 1990 402 p

(ISBN-0-315-68826-2) Avail: Univ. Microfilms Order No. DANN68826

Measurements are performed in a stationary linear cascade of turbine blades for a range of clearances varying from 0.0 to 5.5 percent blade chord. The downstream flow field is measured with a seven-hole pressure probe at several axial locations. The results are analyzed both in terms of vorticity and total pressure loss. The former quantity provides insight into several aspects of the leakage flow, including size and strength of the leakage vortex in relation to the tip-clearance size and the bound circulation of the blade; the diffusion rate of the tip-leakage vortex and its interaction

with the passage flow. In this context, a simple model of the vortex based on the diffusion of a line vortex is found to be quite accurate. Evaluation of the losses in the downstream measurement planes in relation to the losses measured inside the tip gap help clarify the dominant tip-leakage loss mechanisms. Based on experimental observations, full verification of existing turbomachinery tip-leakage loss prediction schemes is performed. An improved tip-leakage loss model is developed using one of the existing models as the starting point. Following the stationary linear cascade tests, relative tipwall motion is simulated by a moving belt. Three clearance sizes of 1.5, 2.4 and 3.8 percent blade chord are examined. The tip-gap and downstream flow together with blade pressures are measured for several wall speeds. As the relative wall speed is increased, the mass flow rate through the gap is significantly reduced. The dominant mechanism behind this trend is identified. The relative wall motion alters the tip vortex and passage vortex structures substantially. The trends in the blade loading are found to be in agreement with the observed changes in the vortex structures. Based on the experimental results, the tip-vortex and tip-gap flow models are extended to the case of relative tipwall motion. Succeeding the experimental and theoretical work on tip-leakage flow for plain tip geometry, blade tip treatments to reduce tip-leakage losses are tested with stationary and moving tipwall for clearance sizes of 2.4 and 3.7 percent blade chord. Three types of winglets consisting of pressure-side, suction-side and a combination of the two are considered in comparison to the regular blade tip. Losses extracted from measurements downstream of the blades suggest some reduction of tip-leakage losses with the application of winglets. The possible physical mechanisms by which winglets reduce the losses are discussed on the basis of downstream flow field data and tipwall static pressures. Dissert. Abstr.

AIRCRAFT ENGINE RELIABILITY ANALYSIS USING LOWER CONFIDENCE LIMIT ESTIMATE PROCEDURES M.S. Thesis
Richard P. Baldwin 14 Dec. 1992 91 p
(AD-A260386) Avail: CASI HC A05/MF A01

In this thesis, a spreadsheet model was developed to compute the lower confidence limit (LCL) for the reliability of a complex weapon system using a personal computer. The LCL is an estimate of the lowest reliability a system is expected to have at a given point in time with a given level of confidence. The reliability model is based on a Weibull distribution for the system component failure times. The reliability LCL procedures were extensively validated and determined to be quite accurate when the expected number of failures is at least 10. This model is capable of supporting LCL decisions in support of the Component Improvement Program or new weapon system procurement where reliability growth analysis is used as a decision support tool. This procedure also provides program managers and engineers with a method to perform LCL analysis and thereby reduce their dependence on contractor supplied reliability data. GRA

TRAIL MANEUVER GENERATION AND SELECTION IN THE PALADIN TACTICAL DECISION GENERATION SYSTEM
Alan R. Chappell (Lockheed Engineering and Sciences Co., Hampton, VA.), John W. McManus, and Kenneth H. Goodrich Jan. 1993 13 p Previously announced in IAA as A92-55255
(RTOP 505-64-30-01)
(NASA-TM-107722; NAS 1.15:107722) Avail: CASI HC A03/MF A01

To date, increased levels of maneuverability and controllability in aircraft have been postulated as tactically advantageous, but little research has studied maneuvers or tactics that make use of these capabilities. In order to help fill this void, a real-time tactical decision generation system for air combat engagements, Paladin, has been developed. Paladin models an air combat engagement as a series of discrete decisions. A detailed description of Paladin's decision making process is presented. This includes the sources of data used, methods of generating reasonable maneuvers for the Paladin aircraft, and selection criteria for choosing the 'best' maneuver. Simulation results are presented that show Paladin to be relatively insensitive to errors introduced into the decision process by estimation of future positional and geometric data. Author

SUMMARY OF THE EFFECTS OF ENGINE THROTTLE RESPONSE ON AIRPLANE FORMATION-FLYING QUALITIES
Kevin R. Walsh Washington Mar. 1993 26 p Presented at the AIAA 28th Joint Propulsion Conference and Exhibit, Nashville, TN, 6-8 Jul. 1992 Previously announced in IAA as A92-48902
(RTOP 307-05-01)
(NASA-TM-4465; H-18880; NAS 1.15:4465; AIAA Paper 92-3318) Avail: CASI HC A03/MF A01

A flight evaluation was conducted to determine the effect of engine throttle response characteristics on precision formation-flying qualities. A variable electronic throttle control system was developed and flight-tested on a TF-104G airplane with a J79-11B engine at the NASA Dryden Flight Research Facility. This airplane was chosen because of its known, very favorable thrust response characteristics. Ten research flights were flown to evaluate the effects of throttle gain, time delay, and fuel control rate limiting on engine handling qualities during a demanding precision wing formation task. Handling quality effects of lag filters and lead compensation time delays were also evaluated. The Cooper and Harper Pilot Rating Scale was used to assign levels of handling quality. Data from pilot ratings and comments indicate that throttle control system time delays and rate limits cause significant degradations in handling qualities. Threshold values for satisfactory (level 1) and adequate (level 2) handling qualities of these key variables are presented. These results may provide engine manufacturers with guidelines to assure satisfactory handling qualities in future engine designs. Author

BANK-TO-TURN MISSILES AND AUTOPILOT DESIGN M.S. Thesis
T. S. Knill 1990 192 p
(ETN-93-93488) Copyright Avail: CASI HC A09/MF A02

Background information on missile autopilots and bank-to-turn steering is given by covering the following topics: where the autopilots fits into the overall command guidance loop; performance requirements, objectives and design problems; the different types of autopilots and their basic design; and a comparison of bank-to-turn and skid-to-turn steering, outlining the advantages and disadvantages of each and looking at experimental evidence that demonstrates the superior aerodynamic properties of certain asymmetrical missiles over circular bodies. The aerodynamic transfer functions, including some of the cross coupling terms, are derived from first principles to allow a relatively 'simplified' (although still very complex) coupled bank-to-turn autopilot to be designed, modeled and analyzed on MATLAB (a computer software package designed for analysis of control systems in block diagram form) for a specific missile design and operating point. The responses of the missile to specific demands are then found and compared for the missile in a bank-to-turn and skid-to-turn configuration. This exercise demonstrates some of the problems involved in the design of a coupled bank-to-turn autopilot and the implementation of the design on conventional software programs. ESA

AN INTRODUCTION TO MULTIVARIABLE FLIGHT CONTROL SYSTEM DESIGN Final Report, Jan. - Oct. 1992
Richard J. Adams, James M. Buffington, Andrew G. Sparks, and Siva S. Banda Oct. 1992 185 p
(AF Proj. 2304)
(AD-A260408; WL-TR-92-3110) Avail: CASI HC A09/MF A02

Background, theory, and examples for full envelope manual flight control system design is presented. An overview of aircraft dynamics and flying qualities is given to provide a basic understanding of the manual flight control problem. Details of available control design and analysis methods are presented to give the reader the required theoretical background. An inner/outer loop control structure is proposed to achieve full envelope flight control designs. Generalized controls are implemented through the

use of a control selector. An inner equalization loop is used to linearize the input/output behavior of the aircraft across the flight envelope. A robust outer loop achieves the desired level of flying qualities. This approach provides a versatile framework for the application of advanced multivariable control theory to aircraft control problems. The engineer has the freedom to choose any method which achieves the design goals. The utility of this controller structure is demonstrated in its successful application to full envelope manual flight control problems for the VISTA F-16 test aircraft and a supermaneuverable F-18 fighter. The results of linear robustness and performance analysis as well as nonlinear simulations are presented for the design examples. GRA

VARIABLE CONTROL SYSTEM LIMITS ON BLACK HAWK AND SEAHAWK HELICOPTERS
J. Blackwell, S. Dutton, R. Toffoletto, and J. F. Harvey Oct. 1992 39 p (AD-A259624; ARL-FLIGHT-MECH-R-191; DODA-AR-007-083) Avail: CASI HC A03/MF A01

Black Hawk and Seahawk helicopters have various fixed physical control limits situated throughout the control system. The range of each pilot control is variable and depends on which limit is reached first. This is a function of the pilot control inputs applied, together with any additional control inputs provided by the automatic flight control system. A procedure was developed to monitor controls in the vicinity of each limit, and determine if any part of the control system approaches to within a prescribed amount of a limit. Warning lights in the cockpit inform the pilot if a limit is being approached. The procedure was used effectively during a First of Class Flight Trial involving a Black Hawk. GRA

REMOTELY PILOTED VEHICLE CONTROL AND INTERFACE SYSTEM Patent Application
Adam J. Simonoff, inventor (to Navy) 3 Sep. 1992 15 p (AD-D015618; US-Patent-Appl-SN-940159; Navy-Case-74060) Avail: CASI HC A03/MF A01

A remotely piloted vehicle control and interface system is provided. A personal computer equipped with an RS232 serial communication port passes an ASCII character(s) as a serial data stream. A shift register device converts the serial data stream to a parallel data character and continuously generates a status signal indicating one of the presence or absence of the parallel data character. A central processing unit, responsive to the status signal, compares the parallel data character with a set of valid control characters to generate a control signal when a match occurs there between. A transmitter, responsive to the control signal, transmits a radio frequency control signal to the remotely piloted vehicle. GRA

VISUAL SYSTEM PERFORMANCE FOR DRIVING SIMULATORS
U. Fligge, M. Soodeen, and K. Moebes Apr. 1992 8 p
(MBB-FE-521-S-PUB-0497; ETN-93-93439) Avail: CASI HC A02/MF A01

Visual system features which are necessary in providing effective visual cues to a driver are addressed. A selected number of applications for driver simulators are described and associated to a class of visual systems. A medium class visual system is then used to create a basis for a definition between required driver visual cues and visual system performance and features. Driver simulation application is concluded as presenting a great challenge to the visual system because of its complexity. The variation of requirements demand that the visual system be based upon a modular design (multichannel system, varying channel resolution) and support a range of system features (z buffer, texture, three dimensional fixed/moving objects, footprint elevation, and fading algorithm). Other features which enhance the acceptance of a visual system as an information source for a driver are the scene update rate and video output format. ESA

(DLR-FB-91-38; ETN-93-91927) Avail: CASI HC A07/MF A02; DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

A method for estimating runway capacity, defined as the maximum

number of aircraft movements per hour, is presented. The method is based on real flight operations in the airport control zone by means of radar data. The method draws from empirical data of the international airports of the Federal Republic of Germany with their local and operational procedures. Both the total range of possible capacity values and the present respectively, future arrival or departure or arrival-departure capacity may be estimated by means of parameter variation. A comparison of future aircraft movements (forecast) with future runway capacity is therefore possible. In this way it can be ascertained, whether or not the forecast movements can be handled by the runway system of an airport. The method is limited to single runways at the moment; the extension to multiple runways is in process. ESA

CHARACTERISTICS OF VERTICAL AND LATERAL TUNNEL TURBULENCE MEASURED IN AIR IN THE LANGLEY TRANSONIC DYNAMICS TUNNEL

Robert K. Sleeper, Donald F. Keller, Boyd Perry, III, and Maynard C. Sandford Mar. 1993 58 p

(RTOP 505-63-50-15)

(NASA-TM-107734; NAS 1.15:107734) Avail: CASI HC A04/MF A01

Preliminary measurements of the vertical and lateral velocity components of tunnel turbulence were obtained in the Langley Transonic Dynamics Tunnel test section using a constant-temperature anemometer equipped with a hot-film X-probe. For these tests air was the test medium. Test conditions included tunnel velocities ranging from 100 to 500 fps at atmospheric pressure. Standard deviations of turbulence velocities were determined and power spectra were computed. Unconstrained optimization was employed to determine parameter values of a general spectral model of a form similar to that used to describe atmospheric turbulence. These parameters, and others (notably break frequency and integral scale length), were determined at each test condition and compared with those of Dryden and Von Karman atmospheric turbulence spectra. When the data were discovered to be aliased, the spectral model was modified to account for and 'eliminate' the aliasing. Author (revised)

SOFT-GROUND ARRESTING SYSTEM FOR COMMERCIAL AIRCRAFT Interim Report

Robert Cook Feb. 1993 39 p

(DOT/FAA/CT-TN93/4) Avail: CASI HC A03/MF A01

A soft-ground arresting system provides an economical and nondestructive means for decelerating an aircraft that would otherwise be unable to stop safely within the confines of the runway including the safety or overrun area. This report validates a mathematical model developed to predict deceleration of an aircraft as it travels through a soft-ground arresting system. Full-scale tests were conducted at the Federal Aviation Administration Technical Center using the FAA's instrumented B-727 aircraft. The speed of the aircraft entering the beds ranged from 20 to 80 knots. The dimensions of the bed were as follows: foam thickness range was from 6 to 18 inches; test bed length was from 88 to 176 feet; width was always 40 feet. In each test the deceleration experienced by the aircraft was recorded in addition to its velocity, landing gear loads, and brake torque. The results of these tests showed that actual measured parameters from the aircraft were within 10 percent of the values predicted by the mathematical model; thus validating the accuracy of this model. The 18-inch-thick foam bed provided the most effective deceleration without exceeding the stresses encountered by the aircraft during normal operation. Fire and rescue equipment can maneuver and conduct emergency operations within the foam arrestor bed without difficulty. Author

OPERATIONAL EVALUATION OF THE CONVERGING RUNWAY DISPLAY AID AT SAINT LOUIS Final Report

M. R. Gilligan and A. E. Gross Dec. 1992 165 p

(Contract DTFA01-89-C-00001)

(MTR-92W0000217; DOT/FAA/RD-93/7) Avail: CASI HC A08/MF A02

This report describes the evaluation of the Converging Runway Display Aid (CRDA) which has been used in an operational environment at Lambert-St. Louis International Airport since December 1990. The intent of the evaluation has been to determine the operational benefits of using CRDA at St. Louis and to assess the operational suitability of the aid for national implementation at those airports which have converging or intersecting runway configurations. As a result of the evaluation, the following was determined: the CRDA computer/human interface is operationally suitable; use of CRDA can increase airport capacity, and that with the DCIA procedures an acceptable margin of safety is provided. This report supports the decision to proceed with the national implementation of CRDA and provides guidance material for potential users of the aid. Author

CONCEPT DEFINITION STUDY FOR AN EXTREMELY LARGE AEROPHYSICS RANGE FACILITY

Hallock F. Swift Washington Feb. 1993 171 p Prepared in cooperation with Physics Applications, Inc., Dayton, OH

(Contract NAS1-19000; RTOP 506-40-71-04)

(NASA-CR-4491; NAS 1.26:4491) Avail: CASI HC A08/MF A02

A conceptual design of a very large aeroballistic range is presented, as are its operational characteristics and procedures. The proposed model launcher is a two-stage light-gas gun, having a launch tube diameter of 254 mm, and the capability of accelerating a 14 kg launch mass to 6.1 km/sec. The gun's 91.4 cm diameter piston is driven by pressurized helium. High pressures in the central breech are contained by a multiple disk arrangement. The blast tank and sabot separation tank are described, as are methods for arresting sabot segments. The conceptual design of the range itself includes a 3.3 m diameter test or flight chamber some 330 m in length. Provisions are made for testing of free flight models and tests in which the model is confined by a track system. Methods for model deceleration and recovery are described. Provisions required for future addition of advanced model launchers such as an electromagnetic launcher or ram accelerator are addressed. Siting and safety issues are also addressed. Author

ICING CLOUD SIMULATOR FOR USE IN HELICOPTER ENGINE INDUCTION SYSTEM ICE PROTECTION TESTING

S. W. Brunnenkant Dec. 1992 53 p

(DOT/FAA/CT-TN92/43) Avail: CASI HC A04/MF A01

Aircraft with Airborne Icing Spraying Systems (AISS) have been used for some time to generate icing clouds into which test aircraft could be flown to show compliance with the requirements of FAR XX.1093. However, the spray arrays used and the relatively large distance between the AISS and aircraft parts to be tested precluded small droplet sizes at high liquid water content at most atmospheric conditions. Some of these shortcomings were overcome by mounting the AISS directly on the test aircraft. This proved to be a very efficient method to develop and certify individual aircraft components. This report describes the methodology and test procedure used with an AISS mounted on a test aircraft to show compliance with FAR 29.1093 for the newly developed inlet of the Bell 222/250-C30G helicopter conversion. Development and certification testing was accomplished in a 4-week period. Author

AN ASSESSMENT OF PERMAFROST CONDITIONS AT THREE DND AIRPORTS IN ARCTIC CANADA AS THEY PERTAIN TO FUTURE PLANNING AND OPERATIONS

C. M. Tucker and A. S. Judge (Geological Survey of Canada, Ottawa, Ontario.) Jul. 1991 48 p

(ORAE Proj. 44107)

(ORAE-R107; CTN-93-60665) Avail: CASI HC A03

Over a cycle of seasons, ground penetrating radar studies were carried out at Arctic airports in Inuvik, Rankin Inlet, and Alert, Northwest Territories. Two of the airports were slated for significant upgrading of runways, taxiways, and parking aprons, providing a good opportunity to investigate the extent of permafrost and its seasonal variation at three locations distributed over a wide geographic area. The study method involved specific and repeated traverses with a Pulse EKKO 3 ground penetrating radar unit. The survey was successful in locating massive ice bodies, in imaging several existing problem areas beneath runways, and mapping the seasonal depth of thaw in permafrost. The study results imply that future monitoring at the sites should be continued in light of suggested ground stability problems due to global warming. Author (CISTI)

GEOGRID REINFORCED BASE COURSES FOR FLEXIBLE PAVEMENTS FOR LIGHT AIRCRAFT: TEST SECTION CONSTRUCTION, BEHAVIOR UNDER TRAFFIC, LABORATORY TESTS, AND DESIGN CRITERIA Final Report

Steve L. Webster Dec. 1992 100 p

(Contract DTFA01-89-Z-02029)

(DOT/FAA/RD-92/25) Avail: CASI HC A05/MF A02

The results of a literature review investigating geogrid reinforced base courses for flexible pavements for light aircraft and the design of a geogrid test section for field testing the validity of potential geogrid reinforcement results have been previously reported. The construction of the field test section, the behavior of the test section under traffic testing using a 30,000 lb single tire load, the data collected, laboratory tests that were conducted on the various geogrid products used in the field test section, and development of design criteria for geogrid base reinforcement for flexible pavements for light aircraft are described. Test results verified the validity of geogrid reinforced base courses for flexible pavements for light aircraft. A geogrid reinforcement product equivalent to the SS-2 geogrid used in the field tests can reduce the total pavement design thickness. The geogrid performance is a function of depth of placement. The thickness reductions range from approximately 40 percent for unreinforced pavement thicknesses of 11 in. to 5 percent for 20-in.-thick pavements. The geogrid reinforcement performs best when placed between the base course and subgrade. The improvement mechanisms for geogrid reinforcement include grid interlock with aggregate base material, subgrade confinement, and to some extent a tensioned membrane effect. The geogrid property requirements for optimum performance are not totally known at this time. The performance of the various geogrid products tested ranged from no improvement up to a 40 percent reduction in total pavement thickness requirement. A relatively rigid sheet-type product (SS-2) performed the best. Author (revised)

TEST REQUIREMENTS FOR COAL-TAR MIXTURES ON AIRPORT PAVEMENTS Final Report, May 1991 - Oct. 1992

Peter E. Sebaaly, Venu Thirmarayappa, and Jon Epps Jan. 1993 46 p

(Contract DTFA01-91-P-07315)

(DOT/FAA/RD-92-27) Avail: CASI HC A03/MF A01

The research documented represents an effort to evaluate the test procedures for coal tar mixtures. The various coal tar test methods were evaluated under several levels of test variables. The freeze-thaw and scuff resistance tests were evaluated under three types of shingles and an aluminum substrate. The fuel resistance test was evaluated under three levels of sand loading and three levels of film thickness. In addition, all of the tests were evaluated under two levels of humidity. The analysis of the data indicates that the effect of the substrate is insignificant in all of the tests. The effect of humidity is significant on some tests, while the effects of sand loading and film thickness are highly significant on the results of the fuel resistance tests. Author (revised)

MULTIPATH RUNWAY EXITS AND TAXIWAYS Final Report

Everett S. Joline Jan. 1993 108 p Prepared for MiTech, Inc., Atlantic City, NJ

(Contract DTFA03-90-C-00036)

(DOT/FAA/CT-92/19) Avail: CASI HC A06/MF A02

As the level of air traffic demand increases in the future, and as advances are made in air traffic control technology to accommodate this traffic, the congestion resulting from aircraft moving on the ground may well become the limiting factor in airport capacity. A family of multipath concepts, based on the use of parallel redundancy for the key components of the airfield system, has been proposed as a means of ameliorating these problems. With these concepts, the number of runway crossings, departure queues, runway exits, and taxiways to/from gates would be increased to the design practices of today. An airport simulation model is used in this study to demonstrate each of the proposed concepts, as applied to six existing U.S. airports, and to develop quantitative estimates of the benefits of reducing delay and increasing throughput. The results show that while significant improvements in performance can be obtained, the application of a particular concept to a particular airport depends heavily on the characteristics of that airport. The study also demonstrates how simulation can be used as an effective tool for evaluating airport improvement alternatives at a specific airport. Author

PERFORMANCE AND TEST SECTION FLOW CHARACTERISTICS OF THE NATIONAL FULL-SCALE AERODYNAMICS COMPLEX 80- BY 120-FOOT WIND TUNNEL

Peter T. Zell Jan. 1993 66 p

(RTOP 505-50-28)

(NASA-TM-103920; A-92058; NAS 1.15:103920) Avail: CASI HC A04/MF A01

Results from the performance and test section flow calibration of the 80- by 120-Foot Wind Tunnel are presented. Measurements indicating the 80- by 120-ft test section flow quality were obtained throughout the tunnel operational envelope and for atmospheric wind speeds up to approximately 20 knots. Tunnel performance characteristics and a dynamic pressure system calibration were also documented during the process of mapping the test section flow field. Experimental results indicate that the test section flow quality is relatively insensitive to dynamic pressure and the level of atmospheric winds experienced during the calibration. The dynamic pressure variation in the test section is within +/-75 percent of the average. The axial turbulence intensity is less than 0.5 percent up to the maximum test section speed of 100 knots, and the vertical and lateral flow angle variations are within +/-5 deg and +/-7 deg, respectively. Atmospheric winds were found to affect the pressure distribution in the test section only at high ratios of wind speed to test section speed. Author (revised)

A COMPUTER SIMULATION OF A HYPERBARIC CHAMBER ENVIRONMENT M.S. Thesis

Scott R. Lister Dec. 1992 119 p

(Contract N00123-89-G-0598)

(AD-A260137) Avail: CASI HC A06/MF A02

A hyperbaric chamber environment is simulated using a FORTRAN computer program. This program allows the user to input data files of varying chamber conditions and provides a detailed output which can be used for design or chamber operations. Specifically, this program determines life support, temperature and humidity control, and power requirements. After developing the theory and describing the program in detail, complete examples simulating a hyperbaric chamber at 2000 fsw, a submarine lockout chamber at 400 fsw, and a shallow underwater habitat at 56 fsw are demonstrated. AN INTEGRATED ROTORCRAFT AVIONICS/CONTROLS ARCHITECTURE TO SUPPORT ADVANCED CONTROLS AND LOW-ALTITUDE GUIDANCE FLIGHT RESEARCH

Robert A. Jacobsen, Douglas H. Doane, Michelle M. Eshow (Army Aviation Systems Command, Saint Louis, MO.), Edwin W. Aiken, and William S. Hindson Oct. 1992 19 p Presented at the Digital Avionics Conference, Seattle, WA, 5-8 Oct. 1992 Prepared in cooperation with U.S. Army Aviation Systems Command, St. Louis, MO

(RTOP 505-59-36)

(NASA-TM-103983; A-93000; NAS 1.15:103983) Avail: CASI HC A03/MF A01

Salient design features of a new NASA/Army research rotorcraft--the Rotorcraft-Aircrew Systems Concepts Airborne Laboratory (RASCAL) are described. Using a UH-60A Black Hawk helicopter as a baseline vehicle, the RASCAL will be a flying laboratory capable of supporting the research requirements of major NASA and Army guidance, control, and display research programs. The paper describes the research facility requirements of these programs together with other critical constraints on the design of the research system. Research program schedules demand a phased development approach, wherein specific research capability milestones are met and flight research projects are flown throughout the complete development cycle of the RASCAL. This development approach is summarized, and selected features of the research system are described. The research system includes a real-time obstacle detection and avoidance system which will generate low-altitude guidance commands to the pilot on

a wide field-of-view, color helmet-mounted display and a full-authority, programmable, fault-tolerant/fail-safe, fly-by-wire flight control system.

US-Patent-Appl-SN-660380; US-Patent-Class-73-505;
Int-Patent-Class-G01P-13/04) Avail: US Patent and Trademark Office

A system is described for determining motion of an object that is acoustically positioned in a standing wave field in a chamber. Sonic energy in the chamber is sensed, and variation in the amplitude of the sonic energy is detected, which is caused by linear motion, rotational motion, or drop shape oscillation of the object. Apparatus for detecting object motion can include a microphone coupled to the chamber and a low pass filter connected to the output of the microphone, which passes only frequencies below the frequency of sound produced by a transducer that maintains the acoustic standing wave field. Knowledge about object motion can be useful by itself, can be useful to determine surface tension, viscosity, and other information about the object, and can be useful to determine the pressure and other characteristics of the acoustic field.

A transfer device for gripping bogie wheels is discussed. The device will be used to move an aircraft or other wheeled device on a base. The device includes a frame section on which friction rollers that grip the bogie wheel are supported. Motors are provided to rotate at least three friction rollers for each wheel, and pressure devices are provided to press the friction rollers against the wheel. The device includes a power device, transmission devices to provide the motors with power, and devices to place the friction rollers around the wheels and to remove them. The placing devices of the friction rollers are attached to horizontal slides placed on one or more frame beams, so that the friction rollers are able to settle in a position corresponding to the distance between the axles of the set of bogie wheels. The device is applicable to bogie wheels of different sizes and with different distances between the axles, and the distribution of loading over several friction rollers enables minimization of the force per roller directed to the wheel. WHEELED TRANSFER DEVICE FOR MOVING AN AIRCRAFT Patent Application
Matti Sinkkonen, inventor (to Tana-Jyra) 5 Mar. 1992 10 p
(CA-Patent-Appl-SN-2-024584; Int-Patent-Class-B64F-1/10; CTN-93-60684)
Copyright Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada, HC

A transfer device that is equipped with support wheels to move an aircraft or other device equipped with double wheels over a base is discussed. The device includes at least one so-called self-wedging friction roller which grips the wheels of the device beneath the axle, and two support wheels which drive at essentially the same peripheral velocity in the opposite direction. In the transfer device, these two driving support wheels are located close to the line of the friction roller. The transfer device of the invention includes a pushing section with its own wheels, power source, drive, and steering devices. The friction rollers and driving support wheels are located in a transfer unit connected to the pushing section by means of a boom. The boom is connected to the transfer unit by means of a vertical joint and to the pushing unit by means of a horizontal joint. Author (CISTI)

This document is the response to the National Space Policy Directive-4 (NSPD-4), signed by the President on 10 Jul. 1991. Directive NSPD-4 calls upon the Department of Defense (DoD), the Department of Energy (DOE), and the National Aeronautics and Space Administration (NASA) to coordinate national space launch technology efforts and to jointly prepare a 10-year space launch technology plan. The nation's future in space rests on the strength of its national launch technology program. This plan documents our current launch technology efforts, plans for future initiatives in this arena, and the overarching philosophy that links these activities into an integrated national technology program. NASA AUTOMATED RENDEZVOUS AND CAPTURE REVIEW. A COMPILATION OF THE ABSTRACTS Abstracts Only
1991 224 p Review held in Williamsburg, VA, 19-21 Nov. 1991 Prepared in cooperation with Spectra Research Systems, Inc., Arlington, VA
(Contract NASw-4341)
(NASA-TM-108598; NAS 1.15:108598) Avail: CASI HC A10/MF A03

This document presents a compilation of abstracts of papers solicited for presentation at the NASA Automated Rendezvous and Capture Review held in Williamsburg, VA on November 19-21, 1991. Due to limitations on time and other considerations, not all abstracts could be presented during the review. The organizing committee determined however, that all abstracts merited availability to all participants and represented data and information reflecting state-of-the-art of this technology which should be captured in one document for future use and reference. The organizing committee appreciates the interest shown in the review and the response by the authors in submitting these abstracts. For individual titles, see N93-22227 through N93-22321.

Automated spacecraft docking operations are being performed using a full scale motion based simulator and an optical sensor. This presentation will discuss the work in progress at TRW and MSFC facilities to study the problem of automated proximity and docking operations. The docking sensor used in the MSFC Optical Sensor and simulation runs are performed using the MSFC Flat Floor Facility. The control algorithms and six degrees of freedom (6DOF) simulation software were developed at TRW and integrated into the MSFC facility. Key issues being studied are the quantification of docking sensor requirements and operational constraints necessary to perform automated docking maneuvers, control algorithms capable of performing automated docking in the presence of sensitive and noisy sensor data, and sensor technologies for automated proximity and docking operations. As part of this study the MSFC sensor characteristics were analyzed and modeled so that off line simulation runs can be performed for control algorithm testing. Our goal is to develop and demonstrate full 6DOF docking capabilities with actual sensors on the MSFC motion based simulator. We present findings from actual docking simulation runs which show sensor and control loop performance as well as problem areas

which require close attention. The evolution of various control algorithms using both phase plane and Clohessy-Wiltshire techniques are discussed. In addition, 6DOF target acquisition and control strategies are described.

The purpose of this report is to address Cargo Transfer Vehicle (CTV) RCS contamination issues and contribute to the resources necessary to optimize the vehicle and propulsion systems required in the CTV of the National Launch System (NLS) Heavy Lift Launch Vehicle (HLLV). This study reviews the thruster-induced contaminants; their transportation from the thrust chamber to the vehicle, payload, and SSF; and the mechanism by which damage is inflicted on their components. The effect of both monopropellant and bipropellant RCS rocket exhaust plumes on a spacecraft and related functional surfaces has been the subject of considerable study over the years. It is recognized that the RCS rocket produces contaminants which can significantly degrade the performance of optical windows, solar cells, thermal-protective coatings, and other external vehicle components. This is particularly true when the rocket is operating in the pulse mode. The exhaust plume impingement pressure and heat-transfer phenomena also complicate the environment to which the vehicle and its functional surfaces are exposed, but are not addressed in this study. Bipropellant contamination presented several modes of damage to incident surfaces, which can pose a long-term deleterious consequence to CTV payloads and the Space Station Freedom (SSF). Monopropellant contamination did not pose any significant long-term issues other than the possibility of aniline deposition. The use of either bipropellant and monopropellant propulsion systems can have a design impact on the CTV propulsion system with respect to maneuvering operations in the proximity of SSF.

The nonlinear behavior of many practical systems and unavailability of quantitative data regarding the input-output relations makes the analytical modeling of these systems very difficult. On the other hand, approximate reasoning-based controllers which do not require analytical models have demonstrated a number of successful applications such as the subway system in the city of Sendai. These applications have mainly concentrated on emulating the performance of a skilled human operator in the form of linguistic rules. However, the process of learning and tuning the control rules to achieve the desired performance remains a difficult task. Fuzzy Logic Control is based on fuzzy set theory. A fuzzy set is an extension of a crisp set. Crisp sets only allow full membership or no membership at all, whereas fuzzy sets allow partial membership. In other words, an element may partially belong to a set.

With the advent of multiple-vehicle operations in support of the space station, on-orbit refurbishment, and several other missions, there is a need to intelligently plan proximity operations trajectories that will conserve limited available fuel while avoiding collisions. Upon reaching the objective, the capture process entails several unique considerations, such as coordinating motion with a tumbling target, the capture itself, and adapting to control of the new configuration resulting from the capture operation. This paper outlines a systematic process of technical development over several years at the Draper laboratory, culminating in a capability to perform manual augmented or fully autonomous rendezvous, capture, and control of the resulting configuration.

Shuttle to Space station docking has become an important issue in the last few years. Docking sensors have been proposed that will provide high precision measurements required for the fuel efficient rendezvous and docking of space vehicles. These sensors will also be used for satellite servicing and orbital assembly. The performance of the docking sensors must be tested before they are implemented in a space environment. A Six-Degree-of-Freedom (6-DOF) Test Facility has been developed at the Tracking & Communications Section, Johnson Space Center to test the static and dynamic accuracies of docking sensors. A candidate sensor is evaluated by comparing the sensor's static position and velocity measurements to the more accurate 6-DOF system. The 6-DOF Test Facility's hardware is fully integrated. Software has been developed in-house to support system operation. The system has been tested statically and the operational parameters verified. System accuracies remain to be determined. Dynamic testing of the facility is expected to begin shortly. Several companies such as McDonnell Douglas, Autonomous Technologies, and General Dynamics are scheduled to test sensors in the next few months. The 6-DOF facility will be available for use in November 1991. This presentation describes the subcomponents, operation, and capabilities of the 6-DOF Test Facility. Discussions will be held on system accuracies. Additional applications of the 6-DOF system will also be addressed.

In this presentation, we will propose a strongly goal-oriented stereo vision system to establish proper docking approach motions for automated rendezvous and capture (AR&C). From an input sequence of stereo video image pairs, the system produces a current best estimate of: contact position; contact vector; contact velocity; and contact orientation. The processing demands imposed by this particular problem and its environment dictate a special case solution; such a system should necessarily be, in some sense, minimalist. By this we mean the system should construct a scene description just sufficiently rich to solve the problem at hand and should do no more processing than is absolutely necessary. In addition, the imaging resolution should be just sufficient. Extracting additional information and constructing higher level scene representations wastes energy and computational resources and injects an unnecessary degree of complexity, increasing the likelihood of malfunction. We therefore take a departure from most prior stereopsis work, including our own, and propose a system based on associative memory. The purpose of the memory is to immediately associate a set of motor commands with a set of input visual patterns in the two cameras. That is, rather than explicitly computing point correspondences and object positions in world coordinates and trying to reason forward from this information to a plan of action, we are trying to capture the essence of reflex behavior through the action of associative memory. The explicit construction of point correspondences and 3D scene descriptions, followed by online velocity and point of impact calculations, is prohibitively expensive from a computational point of view for the problem at hand. Learned patterns on the four image planes, left and right at two discrete but closely spaced instants in time, will be bused directly to infer the spacecraft reaction. This will be a continuing online process as the docking collar approaches.

Automated Rendezvous and Capture (AR&C) is an important technology to multiple National Aeronautics and Space Administration (NASA) programs and centers. The recent Johnson Spacecraft Center (JSC) AR&C Quality Function Deployment (QFD) has listed on-orbit demonstration of related technologies as a near term priority. Martin Marietta has been evaluating use of the Manned Maneuvering Unit (MMU) for a low cost near term on-orbit demonstration of AR&C technologies such as control algorithms, sensors, and processors as well as system level performance. The MMU Program began in 1979 as the method of repairing the Space Shuttle (STS) Thermal Protection System (the tiles). The units were not needed for this task, but were successfully employed during three Shuttle flights in 1984: a test flight was flown in in February as proof of concept, in April the MMU participated in the Solar Max Repair Mission, and in November the MMU's returned to space to successfully rescue the two errant satellites, Westar and Palapa. In the intervening years, the MMU simulator and MMU Qualification Test Unit (QTU) have been used for Astronaut training and experimental evaluations. The Extra-Vehicular Activities (EVA) Retriever has used the QTU, in an unmanned form, as a free-flyer on the Johnson Space Center (JSC) Precision Air Bearing Floor (PABF). Currently, the MMU is undergoing recertification for flight. The two flight units were removed from storage in September, 1991 and evaluation tests were performed. The tests demonstrated that the units are in good shape with no discrepancies that would preclude further use. The Return to Flight effort is currently clearing up recertification issues and evaluating the design against the present Shuttle environments. Author

Rendezvous and capture (docking) operations may be performed either automatically or under manual control. In cases where humans are far from the mission site, or high-bandwidth communications lines are not in place, automation is the only option. Such might be the case with unmanned missions to the moon or Mars that involve orbital docking or cargo transfer. In crewed situations where sensors, computation capabilities, and other necessary instrumentation are unavailable, manual control is the only alternative. Power, mass, cost, or other restrictions may limit the availability of the machinery required for an automated rendezvous and capture. The only occasions for which there is a choice about whether to use automated or manual control are those where the vehicle(s) have both the crew and instrumentation necessary to perform the mission either way. The following discussion will focus on the final approach or capture (docking) maneuver. The maneuvers required for long-range rendezvous operations are calculated by computers. It is almost irrelevant whether it is an astronaut, watching a count-down timer who pushes the button firing the thruster or whether the computer keeps track of the time and fires with the astronaut monitoring. The actual manual workload associated with a mission that may take as long as hours or days to perform is small. The workload per unit time increases tremendously during the final approach (docking) phase and this is where the issue of manual versus automatic is more important. Author

In the development of the technology for autonomous rendezvous and docking, key infrastructure capabilities must be used for effective and economical development. This involves facility capabilities, both equipment and personnel, to devise, develop, qualify, and integrate ARD elements and subsystems into flight programs. One effective way of reducing technical risks in developing ARD technology is the use of the ultimate test facility, using a Shuttle-based reusable free-flying testbed to perform a Technology Demonstration Test Flight which can be structured to include a variety of additional sensors, control schemes, and operational approaches. This conceptual testbed and flight demonstration will be used to illustrate how technologies and facilities at MSFC can be used to develop and prove an ARD system. Author

As a result of the Augustine Committee's recommendation to the National Space Council, NASA, and the DOD have embarked on a joint program to provide the nation with a new capability for transporting payloads into space. The National Launch System (NLS) consists of a family of modular launch vehicles, combining elements of current launchers (Titan and Shuttle) with newly developed components. This family consists of (1) NLS-1 (a vehicle capable of delivering 80 k to SSF), (2) NLS-2 (a vehicle capable of delivering 50k to LEO), and (3) NLS-3 (a vehicle capable of delivering 20 k to LEO). Management of the program is shared between the two agencies with a Joint Program Office carrying out the level 2 management and integration function while both the NASA and Air Force field organizations are charged with the various development and operational responsibilities. Project SIREN (Search, Intercept, Retrieve, Expulsion Nuclear) has been created to identify and evaluate the technologies and operational strategies needed to rendezvous with and capture aerospace radioactive materials (e.g., a distressed or spent space reactor core) before such materials can reenter the terrestrial atmosphere and then to safely move these captured materials to an acceptable space destination for proper disposal. A major component of the current Project SIREN effort is the development of an interactive technology model (including a computerized data base) that explores in building block fashion the interaction of the technologies and procedures needed to successfully accomplish a SIREN mission. This SIREN model will include appropriate national and international technology elements-both contemporary and projected into the next century. To permit maximum flexibility and use, the SIREN technology data base is being programmed for use on 386-class PC's. Author

Proposed future space exploration, such as lunar and Martian expeditions, will require autonomous docking of space vehicles. One proposed candidate method of autonomous docking utilizes a actively controlled parallel manipulator. Operation of the proposed docking manipulator can be

segmented into four successive events: prealignment, capture/latching, attenuation, and structural rigidization. This paper discusses the development and testing of a digitally controlled, six-degree-of-freedom (6-DOF), parallel manipulator for the prealignment segment of a docking spacecraft. Author

US AUTOMATED RENDEZVOUS AND CAPTURE CAPABILITIES REVIEW. REMOTE UMBILICAL SYSTEM ABSTRACT Abstract Only **c13**

Eduardo Lopez delCastillo *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 2 p (For primary document see N93-22226 08-12)
Avail: CASI HC A01/MF A03

This document will describe the technology developed at Kennedy Space Center (KSC) to demonstrate automatic tracking, docking, and mating of umbilical systems. Specifically the use of a real time six degree of freedom (6DOF) target tracking vision system, (developed by Adaptive Automation, Inc. under contract to KSC), is discussed in detail. The paper describes the use of mechanical compliance in the docking, mating, and tracking-after-mating operations. The vision system computes six coordinates that define the position and orientation of a three dimensional target using data from a single CCD camera. The camera is mounted on a 6DOF robot arm. After target coordinates are computed, they are transmitted to a supervisory computer which controls the robot motion in real time. Details of the image processing algorithms, image processing hardware, and target configuration used in the vision system are discussed in the paper. The motion of the space vehicle relative to the service structure after mating led us to the development of a compliant system that allows enough displacement of the target relative to the camera so that tracking after mating may continue. This reduces internal stresses between flight and ground hardware. Author

AUTOMATED TARGET RECOGNITION AND TRACKING USING AN OPTICAL PATTERN RECOGNITION NEURAL NETWORK Abstract Only **c74**

Tien-Hsin Chao *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 2 p (For primary document see N93-22226 08-12)
Avail: CASI HC A01/MF A03

The on-going development of an automatic target recognition and tracking system at the Jet Propulsion Laboratory is presented. This system is an optical pattern recognition neural network (OPRNN) that is an integration of an innovative optical parallel processor and a feature extraction based neural net training algorithm. The parallel optical processor provides high speed and vast parallelism as well as full shift invariance. The neural network algorithm enables simultaneous discrimination of multiple noisy targets in spite of their scales, rotations, perspectives, and various deformations. This fully developed OPRNN system can be effectively utilized for the automated spacecraft recognition and tracking that will lead to success in the Automated Rendezvous and Capture (AR&C) of the unmanned Cargo Transfer Vehicle (CTV). One of the most powerful optical parallel processors for automatic target recognition is the multichannel correlator. With the inherent advantages of parallel processing capability and shift invariance, multiple objects can be simultaneously recognized and tracked using this multichannel correlator. This target tracking capability can be greatly enhanced by utilizing a powerful feature extraction based neural network training algorithm such as the neocognitron. The OPRNN, currently under investigation at JPL, is constructed with an optical multichannel correlator where holographic filters have been prepared using the neocognitron training algorithm. The computation speed of the neocognitron-type OPRNN is up to 10(exp 14) analog connections/sec that enabling the OPRNN to outperform its state-of-the-art electronics counterpart by at least two orders of magnitude. The purpose of this study is to determine the adequacy of the Global Positioning System (GPS) in providing relative navigation for automated rendezvous and proximity operations. The study was performed using the Proximity Operations Simulator (POS), Lockheed's high-fidelity, 6 degree of freedom simulation of the space shuttle and space station. This simulation includes identical models of GPS receivers for each vehicle. The navigation software in each vehicle includes identical Kalman filters. Each filter computes the absolute state of its vehicle, and the relative state vector is obtained by simply subtracting absolute states. Author

Avail: CASI HC A01/MF A03

The Space Automation and Robotics Center (SpARC), a NASA-sponsored Center for the Commercial Development of Space (CCDS), in conjunction with its corporate affiliates, is planning an on-orbit validation of autonomous rendezvous and docking (ARD) technology. The emphasis in this program is to utilize existing technology and commercially available components whenever possible. The primary subsystems that will be validated by this demonstration include GPS receivers for navigation, a video-based sensor for proximity operations, a fluid connector mechanism to demonstrate fluid resupply capability, and a compliant, single-point docking mechanism. The focus for this initial experiment will be expendable launch vehicle (ELV) based and will make use of two residual Commercial Experiment Transporter (COMET) service modules. The first COMET spacecraft will be launched in late 1992 and will serve as the target vehicle. The ARD demonstration will take place in late 1994, after the second COMET spacecraft has been launched. The service module from the second COMET will serve as the chase vehicle. Author

REAL-TIME SIMULATIONS FOR AUTOMATED RENDEZVOUS AND CAPTURE Abstract Only **c13**

John A. Cuseo *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 2 p (For primary document see N93-22226 08-12)
Avail: CASI HC A01/MF A03

Although the individual technologies for automated rendezvous and capture (AR&C) exist, they have not yet been integrated to produce a working system in the United States. Thus, real-time integrated systems simulations are critical to the development and pre-flight demonstration of an AR&C capability. Real-time simulations require a level of development more typical of a flight system compared to purely analytical methods, thus providing confidence in derived design concepts. This presentation will describe Martin Marietta's Space Operations Simulation (SOS) Laboratory, a state-of-the-art real-time simulation facility for AR&C, along with an implementation for the Satellite Servicer System (SSS) Program. Marshall Space Flight Center has a long history of involvement in the

design of Autonomous Rendezvous and Capture (AR&C) systems. The first extensive studies were begun in the late seventies, incrementally leading to the development of an assortment of Guidance, Navigation, and Control (GN&C) concepts and algorithms suitable for a variety of mission requirements and spacecraft capabilities, with a strong emphasis placed upon flexible system-level design. These efforts have led to the development of sophisticated algorithms for docking with tumbling targets, and simple but efficient algorithms for stabilized spacecraft; each has been tested and validated using dynamic system simulation, with hardware in the loop when practical. Recent investigations include the use of neural networks for video image interpretation, and fuzzy logic for control system implementation. Author

IMP (Integrated Mission Program) is a simulation language and code used to model present and future Earth, Moon, or Mars missions. The profile is user controlled through selection from a large menu of events and maneuvers. A Fehlberg 7/13 Runge-Kutta integrator with error and step size control is used to numerically integrate the differential equations of motion (DEQ) of three spacecraft, a main, a target, and an observer. Through selection, the DEQ's include guided thrust, oblate gravity, atmosphere drag, solar pressure, and Moon gravity effects. Guide parameters for thrust events and performance parameters of velocity changes (Delta-V) and propellant usage (maximum of five systems) are developed as needed. Print, plot, summary, and debug files are output. Author

CONTROL OF A VARYING THRUST SPACECRAFT FOR AUTONOMOUS SPACE RENDEZVOUS Abstract Only c18

Travis E. Dawson, Jr. *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 1 p (For primary document see N93-22226 08-12)

Avail: CASI HC A01/MF A03

Before the use of autonomous rendezvous will be allowed as a substitute for man-in-the-loop control, adequate safety and mission performance will have to be guaranteed. Most autopilots for autonomous rendezvous of spacecraft assume constant thrust reaction control system (RCS) thrusters. This assumption implies either true constant thrust RCS thrusters or thrusters whose thrust levels vary very slowly. The ongoing work described in this presentation examines the autonomous rendezvous problem when varying thrust RCS thrusters are inherent in the system equations of motion. Author

LASER DOCKING SENSOR ENGINEERING MODEL Abstract Only c36

Kent Dekome and Joseph M. Barr (Lockheed Engineering and Sciences Co., Houston, TX.) *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 1 p (For primary document see N93-22226 08-12)

Avail: CASI HC A01/MF A03

NASA JSC has been involved in the development of Laser sensors for the past ten years in order to support future rendezvous and docking missions, both manned and unmanned. Although many candidate technologies have been breadboarded and evaluated, no sensor hardware designed specifically for rendezvous and docking applications has been demonstrated on-orbit. It has become apparent that representative sensors need to be flown and demonstrated as soon as possible, with minimal cost, to provide the capability of the technology in meeting NASA's future AR&C applications. Technology and commercial component reliability have progressed to where it is now feasible to fly hardware as a detailed test objective minimizing the overall cost and development time. This presentation will discuss the ongoing effort to convert an existing in-house developed breadboard to an engineering model configuration suitable for flight. The modifications include improving the ranger resolution and stability with an in-house design, replacing the rack mounted galvanometric scanner drivers with STD-bus cards, replacing the system controlling personal computer with a microcontroller, and repackaging the subsystems as appropriate. The sensor will use the performance parameters defined in previous JSC requirements working groups as design goals and be built to withstand the space environment where fiscally feasible. Testing of the in-house ranger design is expected to be completed in October. The results will be included in the presentation. Preliminary testing of the ranging circuitry indicates a range resolution of 4mm is possible. The sensor will be mounted in the payload bay on a shelf bracket and have command, control, and display capabilities using the payload general support computer via an RS422 data line. Author

RENDEZVOUS STRATEGY IMPACTS ON CTV AVIONICS DESIGN, SYSTEM RELIABILITY REQUIREMENTS, AND AVAILABLE COLLISION AVOIDANCE MANEUVERS Abstract Only c18

William J. Donovan and John E. Davis *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 3 p (For primary document see N93-22226 08-12)

Avail: CASI HC A01/MF A03

Rockwell International is conducting an ongoing program to develop avionics architectures that provide high intrinsic value while meeting all mission objectives. Studies are being conducted to determine alternative configurations that have low life-cycle cost and minimum development risk, and that minimize launch delays while providing the reliability level to assure a successful mission. This effort is based on four decades of providing ballistic missile avionics to the United States Air Force and has focused on the requirements of the NASA Cargo Transfer Vehicle (CTV) program in 1991. During the development of architectural concepts it became apparent that rendezvous strategy issues have an impact on the architecture of the avionics system. This is in addition to the expected impact on propulsion and electrical power duration, flight profiles, and trajectory during approach. Author

Recent advances in eye-safe, short wavelength solid-state lasers offer real potential for the development of compact, reliable, light-weight, efficient coherent lidar. Laser diode pumping of these devices has been demonstrated, thereby eliminating the need for flash lamp pumping, which has been a major drawback to the use of these lasers in space based applications. Also these lasers now have the frequency stability required to make them useful in coherent lidar, which offers all of the advantages of non-coherent lidar, but with the additional advantage that direct determination of target velocity is possible by measurement of the Doppler shift. By combining the Doppler velocity measurement capability with the inherent high angular resolution and range accuracy of lidar it is possible to construct

Doppler images of targets for target motion assessment. A coherent lidar based on a Tm,Ho:YAG 2-micrometer wavelength laser was constructed and successfully field tested on atmospheric targets in 1990. This lidar incorporated an all solid state (laser diode pumped) master oscillator, in conjunction with a flash lamp pumped slave oscillator. Solid-state laser technology is rapidly advancing, and with the advent of high efficiency, high power, semiconductor laser diodes as pump sources, all-solid-state, coherent lidars are a real possibility in the near future. MSFC currently has a feasibility demonstration effort under way which will involve component testing, and preliminary design of an all-solid-state, coherent lidar for automatic rendezvous, and capture. This two year effort, funded by the Director's Discretionary Fund is due for completion in 1992. Author

A SYNTHETIC ENVIRONMENT FOR VISUALIZATION AND PLANNING OF ORBITAL MANEUVERS Abstract Only **c14**

Stephen R. Ellis (California Univ., Berkeley.) and Arthur J. Grunwald (Technion - Israel Inst. of Tech., Haifa.) *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 2 p (For primary document see N93-22226 08-12)

Avail: CASI HC A01/MF A03

An interactive proximity operations planning system, which allows on-site planning of fuel-efficient, multi-burn maneuvers in a potential multi-space-craft environment has been developed and tested. This display system most directly assists planning by providing visual feedback in a synthetic virtual space that aids visualization of trajectories and their constraints. Its most significant features include (1) an 'inverse dynamics' algorithm that removes control nonlinearities facing the operator and (2) a stack-oriented action-editor that reduces the order of control and creates, through a 'geometric spreadsheet,' the illusion of an inertially stable environment. This synthetic environment provides the user with control of relevant static and dynamic properties of way-points during small orbital changes allowing independent solutions to otherwise coupled problems of orbital maneuvering. FLIGHT SUPPORT SYSTEM (FSS) DOCKING AND UMBILICAL SERVICES SYSTEMS Abstract Only **c18**

Edward Falkenhayn *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 1 p (For primary document see N93-22226 08-12)

Avail: CASI HC A01/MF A03

The Satellite Servicing Project at GSFC in the early 80's developed a facility for servicing observatories in orbit when docked on the shuttle. The facility includes a three point docking ring and one or two umbilicals to provide power, data and command capability to docked payloads. This facility was used in the 1984 repair of the Solar Maximum satellite. It will be used for the Hubble repair mission in 1993, and it is planned to be used on the Explorer Platform retrieval mission in 1995 and for servicing AXAF in the late 90's. The basic three point docking mechanisms and umbilical interfaces were adopted by the OMU Project for that vehicle's remote rendezvous and docking mission capability. This would have assured a common interface for a serviceable payload for either shuttle based or remote servicing, i.e., HST. For OMU remote servicing, quick reaction docking latches were under development when that Project was cancelled. Although there is no remote servicing capability being funded at present, the EOS spacecraft configuration does include three pins compatible with the FSS latches as a contingency planning measure. The dynamic nature of the Cargo Transfer Vehicle's (CTV) mission and the high level of autonomy required mandate a complete fault management system capable of operating under uncertain conditions. Such a fault management system must take into account the current mission phase and the environment (including the target vehicle), as well as the CTV's state of health. This level of capability is beyond the scope of current on-board fault management systems. This presentation will discuss work in progress at TRW to apply artificial intelligence to the problem of on-board fault management. The goal of this work is to develop fault management systems. This presentation will discuss work in progress at TRW to apply artificial intelligence to the problem of on-board fault management. The goal of this work is to develop fault management systems that can meet the needs of spacecraft that have long-range autonomy requirements. We have implemented a model-based approach to fault detection and isolation that does not require explicit characterization of failures prior to launch. It is thus able to detect failures that were not considered in the failure and effects analysis. We have applied this technique to several different subsystems and tested our approach against both simulations and an electrical power system hardware testbed. We present findings from simulation and hardware tests which demonstrate the ability of our model-based system to detect and isolate failures, and describe our work in porting the Ada version of this system to a flight-qualified processor. We also discuss current research aimed at expanding our system to monitor the entire spacecraft. Author

IMAGE BASED TRACKING APPROACHES TO AR/C AT THE JOHNSON SPACE CENTER Abstract Only **c19**

Timothy E. Fisher and Alan T. Smith (Lockheed Engineering and Sciences Co., Houston, TX.) *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 3 p (For primary document see N93-22226 08-12)

Avail: CASI HC A01/MF A03

Automated Rendezvous and Capture (AR&C) requires the determination of the six degrees of freedom relating two free bodies. Sensor systems that can provide such information have varying sizes, weights, power requirements, complexities and accuracies. One type of sensor system

which can provide several key advantages is an image based tracking system, or better known as a machine vision system. By image based tracking we mean that the sensor is some imaging device such as one or more video cameras, from which the tracking parameters necessary to support the rendezvous and capture operations (range, attitude, etc.) can be derived. Image based tracking offers many advantages such as relative hardware simplicity and reprogrammability. These advantages must be weighed against the disadvantages of these systems, such as limited operational range, poorer accuracy at greater distances and sensitivity to lighting conditions. However, with properly designed algorithms and targets these disadvantages can be minimized for many important applications. Rigorous testing in realistic environments can further increase the robustness and reliability of these systems. This presentation describes the facilities used at JSC to support AR&C image based tracking development and the details of our binocular stereo approach to image based tracking. Author

Avail: CASI HC A01/MF A03

A Panoramic viewing system for Automated Rendezvous and Capture (PARC) has been proposed as a visual information feedback system for terminal docking/berthing. The system relies on a unique Panoramic Annular Lens (PAL) which captures an image of its surroundings in real time. This paper describes the evolution of the PAL along with technical details of its imaging capabilities. Several examples are given of radial metrology, where PAL imaging systems are used to perform visual inspections and measurements. Digital image acquisition and processing techniques, used to interpret various features appearing in the images and to transform images for improved human viewing, are also included. These discussions are followed by a potential application for PARC involving berthing of active and passive mechanical assemblies associated with Space Station Freedom. Author

Avail: CASI HC A01/MF A03

NASA Marshall Space Flight Center (MSFC) has developed and tested an engineering model of an automated rendezvous and docking sensor system composed of a video camera ringed with laser diodes at two wavelengths and a standard remote manipulator system target that has been modified with retro-reflective tape and 830 and 780 mm optical filters. TRW has provided additional engineering analysis, design, and manufacturing support, resulting in a robust, low cost, automated rendezvous and docking sensor design. We have addressed the issue of space qualification using off-the-shelf hardware components. We have also addressed the performance problems of increased signal to noise ratio, increased range, increased frame rate, graceful degradation through component redundancy, and improved range calibration. Next year, we will build a breadboard of this sensor. The phenomenology of the background scene of a target vehicle as viewed against earth and space backgrounds under various lighting conditions will be simulated using the TRW Dynamic Scene Generator Facility (DSGF). Solar illumination angles of the target vehicle and candidate docking target ranging from eclipse to full sun will be explored. The sensor will be transportable for testing at the MSFC Flight Robotics Laboratory (EB24) using the Dynamic Overhead Telerobotic Simulator (DOTS). Author

USE OF NON-SPHERICAL GRAVITY HARMONICS FOR RELATIVE MOTION GN/C (CATEGORY 2) Abstract Only **c18**

David M. Henderson *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 2 p (For primary document see N93-22226 08-12)

Avail: CASI HC A01/MF A03

Detailed analysis of the Automatic Rendezvous and Capture problem indicate a need for three different regions of mathematical description for the GN&C algorithms: (1) multi-vehicle orbital mechanics to the rendezvous interface point, i.e., within 100 nm; (2) relative motion solutions (such as Clohessy-Wiltshire type) from the far-field to the near-field interface, i.e., within 1 nm and; (3) close proximity motion - the near-field motion where the relative differences in the gravitational and orbit inertial accelerations can be neglected from the equations of motion. Limit boundaries to these regions can be precisely defined by further analysis and will be functions of the tracking measurement accuracies and the computer resources available for the solution of the algorithms. This paper analyzes the relative motion in Regions 2 and 3 above and present the derivation and discussion of the general case of non-spherical gravitational perturbed relative motion. Mathematical deviations from the numerically integrated spherical gravity case and solutions from the Clohessy-Wiltshire equations are presented in

the analysis. Based upon this preliminary analysis, it is recommended that further efforts be used to assess the relative position and velocity differences in Region 2 due to non-spherical gravity harmonics and that viable GN&C algorithms be developed to include these gravity perturbations (especially the effects of the first gravity harmonic, J2). Detailed analysis of the Automatic Rendezvous and Capture problem indicate a need for three different regions of mathematical description for the GN&C algorithms: (1) multi-vehicle orbital mechanics to the rendezvous interface point, i.e., within 100 n.; (2) relative motion solutions (such as Clohessy-Wiltshire type) from the far-field to the near-field interface, i.e., within 1 nm; and (3) close proximity motion, the nearfield motion where the relative differences in the gravitational and orbit inertial accelerations can be neglected from the equations of motion. This paper defines the reference coordinate frames and control parameters necessary to model the relative motion and attitude of spacecraft in the close proximity of another space system (Region 2 and 3) during the Automatic Rendezvous and Capture phase of an orbit operation. A Rendezvous Expert System (REX) was implemented on a Symbolics 3650 processor and integrated with the 6 DOF, high fidelity Systems Engineering Simulator (SES) at the NASA Johnson Space Center in Houston, Texas. The project goals were to automate the terminal phase of a shuttle rendezvous, normally flown manually by the crew, and proceed automatically to docking with the Space Station Freedom (SSF). The project goals were successfully demonstrated to various flight crew members, managers, and engineers in the technical community at JSC. The project was funded by NASA's Office of Space Flight, Advanced Program Development Division. Because of the complexity of the task, the REX development was divided into two distinct efforts. One to handle the guidance and control function using perfect navigation data, and another to provide the required visuals for the system management functions needed to give visibility to the crew members of the progress being made towards docking the shuttle with the LVLH stabilized SSF. The European Space Agency (ESA) has been working to develop an autonomous rendezvous and docking capability since 1984 to enable Hermes to automatically dock with Columbus. As a result, ESA with Matra, MBB, and other space companies have developed technologies that are also directly supportive of the current NASA initiative for Automated Rendezvous and Capture. Fairchild and Matra would like to discuss the results of the applicable ESA/Matra rendezvous and capture developments, and suggest how these capabilities could be used, together with an existing NASA Explorer Platform satellite, to minimize new development and accomplish a cost effective automatic closure and capture demonstration program. Several RV sensors have been developed at breadboard level for the Hermes/Columbus program by Matra, MBB, and SAAB. Detailed algorithms for automatic rendezvous, closure, and capture have been developed by ESA and CNES for application with Hermes to Columbus rendezvous and docking, and they currently are being verified with closed-loop software simulation. The algorithms have multiple closed-loop control modes and phases starting at long range using GPS navigation. Differential navigation is used for coast/continuous thrust homing, holdpoint acquisition, V-bar hopping, and station point acquisition. The proximity operation sensor is used for final closure and capture. A subset of these algorithms, comprising the proximity operations algorithms, could easily be extracted and tailored to a limited objective closure and capture flight demonstration.

A video-based sensor has been developed specifically for the close-range maneuvering required in the last phase of autonomous rendezvous and capture. The system is a combination of target and sensor, with the target being a modified version of the standard target used by the astronauts with the Remote Manipulator System (RMS). The system, as currently configured, works well for autonomous docking maneuvers from approximately forty feet in to soft-docking and capture. The sensor was developed specifically to track and calculate its position and attitude relative to a target consisting of three retro-reflective spots, equally spaced, with the center spot being on a pole. This target configuration was chosen for its sensitivity to small amounts of relative pitch and yaw and because it could be used with a small modification to the standard RMS target already in use by NASA. Avail: CASI HC A01/MF A03

Advanced pressure suit and tool designs are beginning to allow extravehicular astronauts to repair space vehicles and so increase mission life and system reliability. A common spacecraft failure that is a severe challenge to the rescue mission planner is loss of attitude control resulting in tumbling motion. If an extravehicular astronaut flying the Manned Maneuvering Unit (MMU) 'falls' into a tumble, the result could be loss of life. TALON (Tumble Arresting Large Oscillation Nullifier) is a device capable of capturing a target in an uncontrolled three-axis tumble. CRADLE (Concentric Rotating Astronaut Detumble Lifesaving Equipment) is a similar device sized to rescue a suited astronaut. The two rescue vehicles work on the same basic principle. They are structural shells with articulated limbs which can surround a tumbling target and thus align both the chaser and target centers of mass (CM). Author (revised)

Avail: CASI HC A01/MF A03

The NASA Johnson Space Center is actively pursuing the development and demonstration of capabilities for automatic rendezvous, proximity operations, and capture (AR&C) using the Space Shuttle as the active vehicle. This activity combines the technologies, expertise, tools, and facilities of the JSC Tracking and Communications Division (EE), Navigation, Control and Aeronautics Division (EG), Automation and Robotics Division (ER), and Structures and Mechanics Division (ES) of the Engineering Directorate and the Flight Design and Dynamics Division (DM) of the Mission Operations Directorate. Potential benefits of AR&C include more efficient and repeatable rendezvous, proximity operations, and capture operations; reduced impacts on the target vehicles (e.g., Orbiter RCS plume loads); reduced flight crew work loads; reduced ground support requirements; and reduced operational constraints. This paper documents the current JSC capabilities/tools/facilities for AR&C and describes a proposed plan for a progression of ground demonstrations and flight tests and demonstrations of AR&C capabilities. This plan involves the maturing of existing technologies in tracking and communications; guidance, navigation and control; mechanisms; manipulators; and systems management and integrating them into several evolutionary demonstration stages. CTV RENDEZVOUS TECHNIQUES Abstract Only **c13**

Jerry L. Jennings and Robert L. Anderson *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 2 p (For primary document see N93-22226 08-12)

Avail: CASI HC A01/MF A03

The cargo transfer vehicle (CTV) requires the capability to perform automated rendezvous with Space Station Freedom (SSF) using onboard sensors and algorithms. The current approach to CTV rendezvous applies techniques developed during the orbital maneuvering vehicle (OMV) program which have been mechanized for automatic, onboard execution. The initial catch up sequence can be described as a passive rendezvous without explicit time of arrival control. The ultimate requirement for this rendezvous technique is to place the CTV on the SSF V-bar axis at some specified downrange distance. The launch vehicle will use yaw steering during orbit injection to achieve the proper phantom plane for nodal biasing. This presentation describes the primary components of the CTV rendezvous scheme. Avail: CASI HC A01/MF A03

In November 1990 the Autonomous Rendezvous & Docking (AR&D) system was first demonstrated for members of NASA's Strategic Avionics Technology Working Group. This simulation utilized prototype hardware from the Cruise Missile and Advanced Centaur Avionics systems. The object was to show that all the accuracy, reliability and operational requirements established for a space craft to dock with Space Station Freedom could be met by the proposed system. The rapid prototyping capabilities of the Advanced Avionics Systems Development Laboratory were used to evaluate the proposed system in a real time, hardware in the loop simulation of the rendezvous and docking reference mission. The simulation permits manual, supervised automatic and fully autonomous operations to be evaluated. It is also being upgraded to be able to test an Autonomous Approach and Landing (AA&L) system. The AA&L and AR&D systems are very similar. Both use inertial guidance and control systems supplemented by GPS. Both use an Image Processing System (IPS), for target recognition and tracking. The IPS includes a general purpose multiprocessor computer and a selected suite of sensors that will provide the required relative position and orientation data. Graphic displays can also be generated by the computer, providing the astronaut / operator with real-time guidance and navigation data with enhanced video or sensor imagery. Author (revised)

OPTICAL CORRELATORS FOR AUTOMATED RENDEZVOUS AND CAPTURE Abstract Only **c74**

Richard Juday *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 2 p (For primary document see N93-22226 08-12)

Avail: CASI HC A01/MF A03

Two dimensional image correlation is a robust technique for recognizing known objects and determining their position with respect to the sensing platform. This capability is of paramount importance to vehicles which must rendezvous and capture using only on-board sensors and processors. Standard digital processors can provide the necessary correlations, but their speed, weight, size and power consumption make them undesirable components of an on-board tracking system. Optical correlators provide correlation results comparable to digital systems, but with a fraction of the size, weight and power and often many times faster. This presentation discusses the application of optical correlators to Automated Rendezvous & Capture (AR&C), and the specific work being done at the Johnson Space Center and DARPA in developing optical correlator technology. Avail: CASI HC A01/MF A03

This paper presents an analysis of the performance of the existing 'Phase One' AR&C system developed at the C.S. Draper Laboratory for both the rendezvous and proximity operations mission phases. This material has been developed as a result of Draper Laboratory involvement through NASA's Johnson Space Center in the development of the flight proven IGN&C rendezvous systems for Apollo, Skylab, and Shuttle. The development of these systems using Draper computer simulations has required automation of all crew inputs to the IGN&C system and thus provided the unique opportunity to develop and test those system capabilities required for AR&C. This paper expands upon the material in the papers presented by the authors at the NASA Autonomous Rendezvous and Docking Conference held at JSC on August 15-16, 1991. Author (revised)

Avail: CASI HC A01/MF A03

This paper will discuss in detail the relative navigation system requirements and sensor trade-offs for Automatic Rendezvous and Capture. Rendezvous navigation filter development will be discussed in the context of navigation performance requirements for a 'Phase One' AR&C system capability. Navigation system architectures and the resulting relative navigation performance for both cooperative and uncooperative target vehicles will be assessed. Relative navigation performance using rendezvous radar, star tracker, radiometric, laser and GPS navigation sensors during appropriate phases of the trajectory will be presented. The effect of relative navigation performance on the Integrated AR&C system performance will be addressed. Linear covariance and deterministic simulation results will be used. Evaluation of relative navigation and IGN&C system performance for several representative relative approach profiles will be presented in order to demonstrate the full range of system capabilities. A summary of the sensor requirements and recommendations for AR&C system capabilities for several programs requiring AR&C will be presented. Author (revised)

This paper describes an ARC system that is an attempt to simplify opration, reduce energy requirements, reduce weight, and provide longterm use and reliability. The ARC system is a laser/optical/holographic (LOH) control system for guidance, rendezvous, and docking (RVD). The LOH/RVD utilizes a hologram, residing at the target platform. Excited by a laser diode, the hologram projects an image at a given distance from the platform. A vision system in the automated chase vehicle sees the projected image and, by optical comparisons, guides the chase vehicle to that image, reaching a proximity conductive to soft docking. The vision system then shifts to a second hologram image holding at close proximity (2mm) to the target platform and guides to it for controlled, precise docking at the rendezvous point. The holographic image projections from the target platform, are composed of color hues and may be circular, triangular or of any other shape and texture that may enhance the ability of the chase vehicle's vision system to analyze information pertinent to velocity, attitude, and roll of the target platform. Any movement of the image, whether planned or errant, will be translated by the vision system into synchronous adjustments throughout the vehicle approach path. Author (revised)

This paper will present some aspects of the effect of inherent laser effects on the performance of CW-Tone modulated and FM-CW laser ranging techniques. It will be shown that performance of these techniques is affected in different ways by inherent laser characteristics and previous comparisons of the techniques should be modified to reflect more realistic conditions. An overall survey of laser ranging will be given to place the CW and FM-CW techniques in perspective. It will be seen that the newly introduced FM-CW laser radar has potentially far superior performance to CW-Tone modulated systems now proposed for use in space rendezvous and capture systems. A the core of any autonomous rendezvous guidance system must be two algorithms for solving Lambert's and Kepler's problems, the two fundamental problems in classical astrodynamics. Lambert's problem is to determine the trajectory connecting specified initial and terminal position vectors in a specified transfer time. The solution is the initial and terminal velocity vectors. Kepler's problem is to determine the trajectory that stems from a given initial state (position and velocity). The solution is the state of an earlier or later specified time. To be suitable for flight software, astrodynamics algorithms must be totally reliable, compact, and fast. Although solving Lambert's and Kepler's problems has challenged some of the world's finest minds for over two centuries, only in the last year have algorithms appeared that satisfy all three requirements just stated. This paper presents an evaluation of the most highly regarded Lambert and Kepler algorithms. Author (revised)

The Onboard Navigation rendezvous expert system is designed to aid the ground flight controller in monitoring the shuttle onboard navigation system. The system is designed to keep track of the navigation sensors and relative state vectors. In addition, the system also keeps an event log and fills out forms usually handled by the flight controller. This expert system is one of the few rendezvous specific systems being developed for the Mission Control Center. The expert system has been in development for six years. Through these years the system has seen hardware, software, and personnel changes. Initial development was done by the Information Systems Directorate (ISD) and Mission Operations Directorate (MOD) at Johnson Space Center. As of October 1, 1991 the system has been turned over to MOD. The system is completely developed except for some minor adjustments to the user interface. The rule base is in the verification stage with total certification of the system due to be completed by May 1992. Test cases for verification are obtained by saving data used for flight controller integrated simulations. The actual data comes from both the shuttle mission simulator and the Mission Control Center Computer. So

far no actual flight data has been available. This paper covers all aspects of the system from the development history to the current hardware, software, and use of the system. Author

The Centaur avionics suite is undergoing a dramatic modernization for the commercial, DoD Atlas and Titan programs. The system has been upgraded to the current state-of-the-art in ring laser gyro inertial sensors and Mil-Std-1750A processor technology. The Cruise Missile avionic system has similarly been evolving for many years. Integration of GPS into both systems has been underway for over five years with a follow-on cruise missile system currently in flight test. Rendezvous and Docking related studies have been conducted for over five years in support of OMV, CTV, and Advanced Upper Stages, as well as several other internal IR&D's. The avionics system and AR&D simulator demonstrated to the SATWG in November 1990 has been upgraded considerably under two IR&D programs in 1991. The Centaur modern avionics system is being flown in block upgrades which started in July of 1990. The Inertial Navigation Unit will fly in November of 1991. The Cruise Missile avionics systems have been fully tested and operationally validated in combat. The integrated AR&D system for space vehicle applications has been under development and testing since 1990. A Joint NASA / GD ARD&L System Test Program is currently being planned to validate several aspects of system performance in three different NASA test facilities in 1992. Author (revised)

The NASA Johnson Space Center (JSC) is involved in the development of an autonomous docking ground demonstration. The demonstration combines the technologies, expertise and facilities of the JSC Tracking and Communications Division (EE), Structures and Mechanics Division (ES), and the Navigation, Guidance and Control Division (EG) and their supporting contractors. The autonomous docking ground demonstration is an evaluation of the capabilities of the laser sensor system to support the docking phase (12ft to contact) when operated in conjunction with the Guidance, Navigation and Control Software. The docking mechanism being used was developed for the Apollo Soyuz Test Program. This demonstration will be conducted using the Six-Degrees of Freedom (6-DOF) Dynamic Test System (DTS). The DTS environment simulates the Space Station Freedom as the stationary or target vehicle and the Orbiter as the active or chase vehicle. For this demonstration the laser sensor will be mounted on the target vehicle and the retroreflectors on the chase vehicle. This arrangement was used to prevent potential damage to the laser. The sensor system. GN&C and 6-DOF DTS will be operated closed-loop. Initial condition to simulate vehicle misalignments, translational and rotational, will be introduced within the constraints of the systems involved. Detailed description of each of the demonstration components (e.g., Sensor System, GN&C, 6-DOF DTS and supporting computer configuration) including their capabilities and limitations will be discussed. A demonstration architecture drawing and photographs of the test configuration will be presented. Author (revised)

Avail: CASI HC A01/MF A03

This paper describes the development of the Rendezvous Radar Set (RRS) for the Orbital Maneuvering Vehicle (OMV) for the National Aeronautics and Space Administration (NASA). The RRS was to be used to locate, and then provide vectoring information to, target satellites (or Shuttle or Space Station) to aid the OMV in making a minimum-fuel-consumption approach and rendezvous. The RRS design is that of an X-Band, all solid-state, monopulse tracking, frequency hopping, pulse-Doppler radar system. The development of the radar was terminated when the OMV prime contract to TRW was terminated by NASA. At the time of the termination, the development was in the circuit design stage. The system design was virtually completed, the PDR had been held. The RRS design was based on Motorola's experiences, both in the design and production of radar systems for the US Army and in the design and production of hi-rel communications systems for NASA space programs. Experience in these fields was combined with the latest digital signal processor and micro-processor technology to design a light-weight, low-power, spaceborne radar. The antenna and antenna positioner (gimbals) technology developed for the RRS is now being used in the satellite-to-satellite communication link design for Motorola's Iridium telecommunications system.

The rendezvous targeting techniques that can be utilized to achieve autonomous guidance for delivering a cargo to Space Station Freedom (SSF) using the National Launch System's (NLS) Heavy Lift Launch Vehicle (HLLV) and the on-orbit Cargo Transfer Vehicle (CTV) are described. This capability is made possible by advancements in autonomous navigation (Global Positioning System - GPS) on-board the CTV and SSF as well as the new generation flight computers. How the HLLV launch window can be decoupled from the CTV phasing window is described. The performance trades that have to be made to determine the length of the launch window and the phasing window between the CTV and SSF are identified and recommendations made that affect mission timelines. INTELLIGENT SYSTEMS TECHNOLOGY INFRASTRUCTURE FOR INTEGRATED SYSTEMS Abstract Only **c63**

Henry Lum, Jr. *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 3 p (For primary document see N93-22226 08-12)
Avail: CASI HC A01/MF A03

Significant advances have occurred during the last decade in intelligent systems technologies (a.k.a. knowledge-based systems, KBS) including research, feasibility demonstrations, and technology implementations in operational environments. Evaluation and simulation data obtained to date in real-time operational environments suggest that cost-effective utilization of intelligent systems technologies can be realized for Automated Rendezvous and Capture applications. The successful implementation of these technologies involve a complex system infrastructure integrating the requirements of transportation, vehicle checkout and health management, and communication systems without compromise to systems reliability and performance. The resources that must be invoked to accomplish these tasks include remote ground operations and control, built-in system fault management and control, and intelligent robotics. To ensure long-term evolution and integration of new validated technologies over the lifetime of the vehicle, system interfaces must also be addressed and integrated into the overall system interface requirements. An approach for defining and

evaluating the system infrastructures including the testbed currently being used to support the on-going evaluations for the evolutionary Space Station Freedom Data Management System is presented and discussed. Intelligent system technologies discussed include artificial intelligence (real-time replanning and scheduling), high performance computational elements (parallel processors, photonic processors, and neural networks), real-time fault management and control, and system software development tools for rapid prototyping capabilities. AN AUTOMATED RENDEZVOUS AND CAPTURE SYSTEM DESIGN CONCEPT FOR THE CARGO TRANSFER VEHICLE AND SPACE STATION FREEDOM Abstract Only **c18**

Ron Fuchs and Steven Marsh *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 3 p (For primary document see N93-22226 08-12)

Avail: CASI HC A01/MF A03

A rendezvous sensor system concept was developed for the cargo transfer vehicle (CTV) to autonomously rendezvous with and be captured by Space Station Freedom (SSF). The development of requirements, the design of a unique Lockheed developed sensor concept to meet these requirements, and the system design to place this sensor on the CTV and rendezvous with the SSF are described . The Jet Propulsion Laboratory, employing the technology assessment that resulted from the Autonomous Rendezvous and Docking Conference held at the Lyndon B. Johnson Space Center on 15-16 Aug. 1990 as the basis undertook a literature search and contacts with major national and international aerospace companies to perform an assessment of the existing technologies and those that are needed to accomplish supervised autonomous rendezvous and docking in space. The following five issues are covered: (1) lessons learned; (2) technology assessment for navigation and guidance sensors for Autonomous Rendezvous and Docking (AR&D); (3) technology assessment of Guidance, Navigation and Controls (GN&C), techniques for rendezvous and docking; (4) docking mechanisms; and (5) space and ground operations. Avail: CASI HC A01/MF A03

A navigation and control system was designed and implemented for an orbital autonomous rescue vehicle envisioned to retrieve astronauts or equipment in the case that they become disengaged from the space station. The rescue vehicle, termed the Extra-Vehicular Activity Retriever (EVAR), has an on-board inertial measurement unit ahd GPS receivers for self state estimation, a laser range imager (LRI) and cameras for object state estimation, and a data link for reception of space station state information. The states of the retriever and objects (obstacles and the target object) are estimated by inertial state propagation which is corrected via measurements from the GPS, the LRI system, or the camera system. Kalman filters are utilized to perform sensor fusion and estimate the state propagation errors. Control actuation is performed by a Manned Maneuvering Unit (MMU). Phase plane control techniques are used to control the rotational and translational state of the retriever. The translational controller provides station-keeping or motion along either Clohessy-Wiltshire trajectories or straight line trajectories in the LVLH frame of any sufficiently observed object or of the space station. The software was used to successfully control a prototype EVAR on an air bearing floor facility, and a simulated EVAR operating in a simulated orbital environment. The design of the navigation system and the control system are presented. Also discussed are the hardware systems and the overall software architecture.

OPTICAL PHASE MEASURING SENSORS FOR AUTOMATED RENDEZVOUS AND CAPTURE Abstract Only **c74**

Wayne Metheny and Mark Malin *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 2 p (For primary document see N93-22226 08-12)

Avail: CASI HC A01/MF A03

A technique is described for sensing relative spatial orientations of approach and target vehicles, using optical phase mensuration (in the interferometric sense, as opposed to LIDAR), in place of the more conventional intensity, image, or transit time measurements. This approach permits the parameters to be measured with great accuracy with relatively simple, small sensors having no moving components. A suite of sensors operating on this principle can produce all desired data using either active detection on the target or passive retroreflection to the detectors on the approach vehicle. These optical phase measurements can be applied to determine bearing angle (location of the target vehicle in the approach vehicle coordinates), range, and attitude (orientation of the target vehicle with respect to the line-of-sight). The first two quantities require the approach vehicle to project a modulated interference pattern into space. The bearing angle is determined for a selected point on the target by measuring the phase of the interference pattern at that point using either a detector on the target or a retroreflector on the target and a detector at the transmitter. The range is found by measuring differential bearing angles to predetermined relative instrumentation sites. Two interferometers, a coarse and a fine ranger are required to resolve the 2pi ambiguity. USE OF AUTOMATED RENDEZVOUS TRAJECTORY PLANNING TO IMPROVE SPACECRAFT OPERATIONS EFFICIENCY Abstract Only **c13**

Tom A. Mulder *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 3 p (For

primary document see N93-22226 08-12)
Avail: CASI HC A01/MF A03

The current planning process for space shuttle rendezvous with a second Earth-orbiting vehicle is time consuming and costly. It is a labor-intensive, manual process performed pre-mission with the aid of specialized maneuver processing tools. Real-time execution of a rendezvous plan must closely follow a predicted trajectory, and targeted solutions leading up to the terminal phase are computed on the ground. Despite over 25 years of Gemini, Apollo, Skylab, and shuttle vehicle-to-vehicle rendezvous missions flown to date, rendezvous in Earth orbit still requires careful monitoring and cannot be taken for granted. For example, a significant trajectory offset was experienced during terminal phase rendezvous of the STS-32 Long Duration Exposure Facility retrieval mission. Several improvements can be introduced to the present rendezvous planning process to reduce costs, produce more fuel-efficient profiles, and increase the probability of mission success. Author

AN INTEGRATED AUTONOMOUS RENDEZVOUS AND DOCKING SYSTEM ARCHITECTURE USING CENTAUR MODERN AVIONICS Abstract Only **c13**
Kurt Nelson *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 2 p (For primary document see N93-22226 08-12)
Avail: CASI HC A01/MF A03

The avionics system for the Centaur upper stage is in the process of being modernized with the current state-of-the-art in strapdown inertial guidance equipment. This equipment includes an integrated flight control processor with a ring laser gyro based inertial guidance system. This inertial navigation unit (INU) uses two MIL-STD-1750A processors and communicates over the MIL-STD-1553B data bus. Commands are translated into load activation through a Remote Control Unit (RCU) which incorporates the use of solid state relays. Also, a programmable data acquisition system replaces separate multiplexer and signal conditioning units. This modern avionics suite is currently being enhanced through independent research and development programs to provide autonomous rendezvous and docking capability using advanced cruise missile image processing technology and integrated GPS navigational aids. A system concept was developed to combine these technologies in order to achieve a fully autonomous rendezvous, docking, and autoland capability. The current system architecture and the evolution of this architecture using advanced modular avionics concepts being pursued for the National Launch System are discussed. Author (revised)

COLLISION AVOIDANCE FOR CTV: REQUIREMENTS AND CAPABILITIES Abstract Only **c13**
Thomas P. Nosek *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 3 p (For primary document see N93-22226 08-12)
Avail: CASI HC A01/MF A03

Cargo transfer vehicle (CTV) operations near Space Station Freedom will require positive collision avoidance maneuver (CAM) capability to preclude any change of collision, even in the event of CTV failures. The requirements for CAM are discussed, and the CAM design approach and design of the Orbiting Maneuvering Vehicle (OMV) are reviewed; this design met requirements for OMV operation near the Space Station, provided a redundant collision avoidance maneuver capability. Significant portions of the OMV CAM design should be applicable to CTV. The key features of the OMV design are summarized and related to the CTV mission design to that of OMV's. CAM is a defined sequence of events executed by the CTV to place the vehicle in a safe position relative to a target such as the Space Station. CAM can be performed through software commands to the propulsion system, or through commands pre-stored in hardware. Various techniques for triggering CAM are considered, and the risks associated with CAM enable and execution in phases are considered. OMV CAM design features both hardware and software CAM capability, with analyses conducted to assess the ability to meet the collision-free requirement during all phases of the mission. PILOTING DECISION AID FOR SPACECRAFT PROXIMITY OPERATIONS Abstract Only **c13**
Cole J. Pierce *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 3 p (For primary document see N93-22226 08-12)
Avail: CASI HC A01/MF A03

The concept of a decision aid to assist the piloting of a powered vehicle during a near-field (less than 2000 feet) rendezvous to another spacecraft is discussed. Using Space Shuttle rendezvous with an orbiting satellite as an example, extensive practice is normally required to successfully effect such a rendezvous with a minimum of propellant. As a rule, variations on a 'point and shoot' technique are optimized and used as much as possible. A piloting decision aid (PDA) to assist in the pointing process was conceived and is in the preliminary stages of development. This concept may be applied to Space Shuttle proximity operations for berthing with Space Station Freedom (SSF), for Shuttle rendezvous with other spacecraft, or for autonomous rendezvous of any unmanned vehicle with SSF. The concept orginated with a task order from NASA JSC for an automated piloting procedure and was influenced by an early air-to-air missile envelope display. Author (revised)

SPACECRAFT RENDEZVOUS OPERATIONAL CONSIDERATIONS AFFECTING VEHICLE SYSTEMS DESIGN AND CONFIGURATION Abstract Only **c18**
Ellen E. Prust *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 3 p (For primary document see N93-22226 08-12)
Avail: CASI HC A01/MF A03

One lesson learned from Orbiting Maneuvering Vehicle (OMV) program experience is that Design Reference Missions must include an appropriate balance of operations and performance inputs to effectively drive vehicle systems design and configuration. Rendezvous trajectory design is based on vehicle characteristics (e.g., mass, propellant tank size, and mission duration capability) and operational requirements, which have evolved through the Gemini, Apollo, and STS programs. Operational constraints affecting the rendezvous final approach are summarized. The two major objectives of operational rendezvous design are vehicle/crew safety and mission success. Operational requirements on the final approach which support these objectives include: tracking/targeting/communications; trajectory dispersion and navigation uncertainty handling; contingency protection; favorable sunlight conditions; acceptable relative state for proximity operations handover; and compliance with target vehicle constraints. A discussion of the ways each of these requirements may constrain the rendezvous trajectory follows. Although the constraints discussed apply to all rendezvous, the trajectory presented in 'Cargo Transfer Vehicle Preliminary Reference Definition' (MSFC, May 1991) was used as the basis for the comments below. APPROACH RANGE AND VELOCITY DETERMINATION USING LASER SENSORS AND RETROREFLECTOR TARGETS Abstract Only **c36**
L. Race, K. J. Kim, J. Wang, W. Schoknecht, and William J. Donovan *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 2 p (For primary document see N93-22226 08-12)
Avail: CASI HC A01/MF A03

Rockwell International is conducting an ongoing program to develop Laser Docking Sensors (LDS) that provide high performance and high intrinsic value while meeting all mission objectives. These LDS systems are now being required to aid future spacecraft docking, station keeping, and berthing/capture systems. Improved automated tracking, rendezvous, soft docking, and capture will be required in the construction and support of SSF and future orbiting platforms. The development of a practical LDS requires an easy-to-operate, low-cost, compact system. A wide range of options for laser range detection equipment, ranging from commercial technology to specialized military systems, was evaluated. This evaluation focused on both direct applicability of existing systems and usability of specific technologies contained in these systems. From these efforts it was determined that a new approach provided the greatest promise of

fulfilling all mission requirements at the lowest life-cycle cost.

AUTOMATED RENDEZVOUS AND DOCKING WITH VIDEO IMAGERY Abstract Only **c13**
Mike Rodgers and Larry Z. Kennedy *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 1 p (For primary document see N93-22226 08-12)
Avail: CASI HC A01/MF A03

For rendezvous and docking, assessing and tracking relative orientation is necessary within a minimum approach distance. Special target light patterns have previously been considered for use with video sensors for ease of determining relative orientation. A generalization of those approaches is addressed. At certain ranges, the entire structure of the target vehicle constitutes an acceptable target; at closer ranges, substructures will suffice. Acting on the same principle as the human intelligence, these structures can be compared with a memory model to assess the relative orientation and range. Models for comparison are constructed from a CAD facet model and current imagery. This approach requires fast image handling, projection, and comparison techniques which rely on rapidly developing parallel processing technology. Relative orientation and range assessment consists of successful comparison of the perceived target aspect with a known aspect. Generating a known projection from a model within required times, say subsecond times, is only now approaching feasibility. With this capability, rates of comparison used by the human brain can be approached and arbitrary known structures can be compared in reasonable times. Future space programs will have access to powerful computation devices which far exceed even this capability. For example, the possibility will exist to assess unknown structures and then control rendezvous and docking, all at very fast rates. The first step which has the current utility, namely applying this to known structures, is taken. Author (revised)

Avail: CASI HC A01/MF A03

Future logistics supply and servicing vehicles such as cargo transfer vehicles (CTV) must have full 6 degree of freedom (6DOF) capability in order to perform requisite rendezvous, proximity operations, and capture operations. The design and performance issues encountered when developing a 6DOF maneuvering spacecraft are very complex with subtle interactions which are not immediately obvious or easily anticipated. In order to deal with these complexities and develop robust maneuvering spacecraft designs, a simulation system and associated family of tools are used at TRW for generating and validating spacecraft performance requirements and guidance algorithms. An overview of the simulator and tools is provided. These are used by TRW for autonomous rendezvous and docking research projects including CTV studies. Author (revised)

PROPOSED CTV DESIGN REFERENCE MISSIONS IN SUPPORT OF SPACE STATION FREEDOM Abstract Only **c18**
Rudy J. Saucillo (McDonnell-Douglas Space Systems Co., Rockville, MD.) and William M. Cirillo *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 1 p (For primary document see N93-22226 08-12)
Avail: CASI HC A01/MF A03

Use of design reference missions (DRM's) for the cargo transfer vehicle (CTV) in support of Space Station Freedom (SSF) can provide a common baseline for the design and assessment of CTV systems and mission operations. These DRM's may also provide baseline operations scenarios for integrated CTV, Shuttle, and SSF operations. Proposed DRM's for CTV, SSF, and Shuttle operations envisioned during the early post-PMC time frame and continuing through mature, SSF evolutionary operations are described. These proposed DRM's are outlines for detailed mission definition; by treating these DRM's as top-level input for mission design studies, a range of parametric studies for systems/operations may be performed. Shuttle flight design experience, particularly rendezvous flight design, provides an excellent basis for DRM operations studies. To begin analysis of the DRM's, shuttle trajectory design tools were used in single case analysis to define CTV performance requirements. A summary of these results is presented. Author (revised)

Avail: CASI HC A01/MF A03

The Global Positioning System (GPS) provides users autonomous, real-time navigation capability. A vehicle equipped with GPS user equipment can receive and process signals transmitted by a constellation of GPS satellites and derive from the resulting measurements the vehicle's position and velocity. Specified accuracies range from 16 to 76 meters and 0.1 to 1.0 meters/second for position and velocity, respectively. In a rendezvous and docking scenario, the use of a technique called relative GPS can provide range and range rate accuracies on the order of 1 meter and 0.01 meters/second, respectively. Relative GPS requires both vehicles to be equipped with GPS user equipment and a data communication link for transmission of GPS data and GPS satellite selection coordination information. Through coordinated satellite selection, GPS measurement errors common to both users are cancelled and improved relative position and velocity accuracies are achieved. The background, the design approach, the expected performance and capabilities, the development plan, and the project status are described. In addition, a description of relative GPS, the possible GPS hardware and software configurations, and its application to automated rendezvous and capture are presented. Author (revised)

A generic planar 3 degree of freedom simulation was developed that supports hardware in the loop simulations, guidance and control analysis, and can directly generate flight software. This simulation was developed in a small amount of time utilizing rapid prototyping techniques. The approach taken to develop this simulation tool, the benefits seen using this approach to development, and on-going efforts to improve and extend this capability are described. The simulation is composed of 3 major elements: (1) Docker dynamics model, (2) Dockee dynamics model, and (3) Docker Contrcl System. The docker and dockee models are based on simple planar orbital dynamics equations using a spherical earth gravity model. The docker control system is based on a phase plane approach to error correction.

Autonomous rendezvous and capture (AR&C) is a critical space technology with significant application to a variety of missions. Martin Marietta Astronautics Group (MMAG) has been developing AR&C technical capability in support of several recent NASA contracts. The use of AR&C for the Mars Rover/Sample Return (MRSR) mission was studied through a contract with JSC. Incorporation of AR&C in the Space Transportation Vehicle (STV) lunar mission was studied through a contract with MSFC. The MMAG has also been developing AR&C simulation capability under independent research and development studies. Simulation development was driven by two goals: comprehensive software simulation of the autonomous rendezvous and capture mission from launch to final capture; and integration of the overall software and hardware simulation to support an AR&C flight demonstration. This presentation will highlight the AR&C software simulation tools and analyze results from their application to the STV lunar mission. Plans for an integrated software and hardware simulation will also be summarized. Author (revised)

AUTOMATING AN ORBITER APPROACH TO SPACE STATION FREEDOM TO MINIMIZE PLUME IMPINGEMENT Abstract Only **c13**

Peter T. Spehar (Lockheed Engineering and Sciences Co., Houston, TX.) and Thomas Quan Le *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 3 p (For primary document see N93-22226 08-12)
Avail: CASI HC A01/MF A03

The Space shuttle orbiter Reaction Control System's (RCS) plume impingement during proximity operations with Space Station Freedom (SSF) is a structural design driver for the SSF solar panels and radiators. A study underway at JSC is investigating whether the use of an automated approach controller could result in the reduction of plume impingement induced loads during orbiter approach to SSF. Ongoing real time person-in-the-loop (PIL) simulations of an orbiter approaching the SSF show that orbiter trajectory control can vary significantly from one pilot to the next. This variation is a cause for concern since current analyses predict that plume impingement loads resulting from PIL orbiter approaches may exceed the solar panel and radiator load limits. The use of an automated approach controller is expected to reduce peak loads by both minimizing orbiter translational jet firings in certain directions and controlling the frequency at which they occur during various phases of the approach. Avail: CASI HC A01/MF A03

This presentation describes the application of robotic and computer vision systems to validate docking and capture operations for space cargo transfer vehicles. Three applications are discussed: (1) air bearing systems in two dimensions that yield high quality free-flying, flexible, and contact dynamics; (2) validation of docking mechanisms with misalignment and target dynamics; and (3) computer vision technology for target location and real-time tracking. All the testbeds are supported by a network of engineering workstations for dynamic and controls analyses. Dynamic simulation of multibody rigid and elastic systems are performed with the TREETOPS code. MATRIXx/System-Build and PRO-MATLAB/Simulab are the tools for control design and analysis using classical and modern techniques such as H-infinity and LQG/LTR. SANDY is a general design tool to optimize numerically a multivariable robust compensator with a user-defined structure. Mathematica and Macsyma are used to derive symbolically dynamic and kinematic equations. Author (revised)

Avail: CASI HC A01/MF A03

Experience from several recent spacecraft development programs, such as Space Station Freedom (SSF) and the Orbital Maneuvering Vehicle (OMV) has shown the need for factoring proximity operations considerations into the vehicle design process. Proximity operations, those orbital maneuvers and procedures which involve operation of two or more spacecraft at ranges of less than one nautical mile, are essential to the construction, servicing, and operation of complex spacecraft. Typical proximity operations considerations which drive spacecraft design may be broken into two broad categories; flight profile characteristics and concerns, and use of various spacecraft systems during proximity operations. Proximity operations flight profile concerns include the following: (1) relative approach/separation line; (2) relative orientation of the vehicles; (3) relative translational and rotational rates; (4) vehicle interaction, in the form of thruster plume impingement, mating or demating operations, or uncontrolled contact/collision; and (5) active vehicle piloting. Spacecraft systems used during proximity operations include the following: (1) sensors, such as radar, laser ranging devices, or optical ranging systems; (2) effector hardware, such as thrusters; (3) flight control software; and (4) mating hardware, needed for docking or berthing operations. A discussion of how these factors affect vehicle design follows, addressing both active and passive/cooperative vehicles. Author (revised)

THE MSFC SPACE STATION/SPACE OPERATIONS MECHANISM TEST BED Abstract Only **c14**

William G. Sutton and Patrick A. Tobbe (Logicon Control Dynamics Co., Huntsville, AL.) *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 3 p (For primary document see N93-22226 08-12)
Avail: CASI HC A01/MF A03

The Space Station/Space Operations Mechanism Test Bed consists of the following: a hydraulically driven, computer controlled Six Degree-of-Freedom Motion System (6DOF); a six degree-of-freedom force and moment sensor; remote driving stations with computer generated or live TV graphics; and a parallel digital processor that performs calculations to support the real time simulation. The function of the Mechanism Test Bed is to test docking and berthing mechanisms for Space Station Freedom and other orbiting space vehicles in a real time, hardware-in-the-loop simulation environment. Typically, the docking and berthing mechanisms are composed of two mating components, one for each vehicle. In the facility, one component is attached to the motion system, while the other component is mounted to the force/moment sensor fixed in the support structure above the 6DOF. The six components of the contact forces/moments acting on the test article and its mating component are measured by the force/moment sensor. Author (revised)

Avail: CASI HC A01/MF A03

Various missions scenarios (Space Station logistics, LEO and GEO services, and SEI operation) will involve flexibility in mission management. This means operations will be one or a combination of the following: autonomous, supervised autonomous, and machine aided manual control. Smart Systems will likely play a significant role in making these missions successful from a safety/reliability perspective and less costly from an operations perspective. This does not imply that Smart Systems need to be super sophisticated. On the contrary, Smart Systems have been described as automated intelligence that if a person had done it wrong, it would be considered stupid. The first part of this paper will describe the types of Smart System techniques involved in AR and CC, their specifications, duties, and interactions. Next will be a discussion of the work performed under the auspice of the ALS Program to further Expert Systems applications imbedded in the control process, NASA/JSC CRAD, and other related IRAD projects. This will include issues pertaining to the following: integration, speed, knowledge encapsulation, and cooperative systems. Finally, a brief description will be offered to outline the major obstacles for the acceptance of Smart Systems in critical applications. Author (revised)

As space vehicles and structures become larger and more complex, the development of systems to assist humans in assembling, operating, maintaining, and performing space rescue or retrieval of these vehicles and structures becomes increasingly important. With the diversity of international spacecraft, both manned and unmanned, planned to be in orbit in the future, a set of guidelines for berthing and docking subsystems is mandatory if servicing, resupply, and retrieval is to become practical on an international level. Successful interaction between these space systems and ground and/or space-based humans requires standardized and effective operational interface designs, particularly with respect to space grasping/berthing/docking interface mechanisms. This paper defines the spacecraft mechanical interfaces necessary to create a standard dynamic envelope for joining two free-flying spacecraft in a 'hard' berth or dock with each other in space. A review was made of past space flights and dynamics simulations dating back to 1962 to obtain necessary parameters and their values for successful manually controlled and autonomous spacecraft docking/berthing. The various spacecraft docking/berthing mechanisms and concepts are illustrated along with their dynamic capture and impact tolerances including maximum contact velocity along the approach axis and in the y-z plane; capture linear misalignment tolerances; and maximum capture roll, pitch, and yaw angles. From this data sets of recommended guidelines parameters were developed for autonomous and manual impact docking tolerances, non-impact grasping/berthing tolerances (end effectors), berthing contact conditions, and alignment tolerances after rigidizing. Also, detailed requirements were developed for mechanical design interface features, as well as latching, unlatching, and separation tolerances. This data was drafted in the form of a proposed ANSI Standard guideline, reviewed, and added to by members of the committee representing several spacecraft manufacturers, NASA, and the USAF, and a consensus was reached. The cargo transfer vehicle (CTV) will be required to perform six degree of freedom (6DOF) maneuvers while carrying a wide range of payloads varying from 100,000 lbm to no payload. The current baseline design configuration for the CTV uses a forward propulsion module (FPM) mounted in front of the payload and the CTV behind the payload so that the center of gravity (CG) of the combined stack is contained between the thruster sets. This allows for efficient rotation and translations of heavy payloads in all directions; however, the FPM is a costly item, so it is desirable to find design solutions which do not require the FPM. This presentation provides an overview of the work performed in analyzing the FPM requirements for the CTV. Specifically, key issues related to thruster configuration requirements for operating the CTV without the FPM, throughout the 100,000 lbm payload to no payload range, will be highlighted. In this study, only the reaction control system (RCS) thruster configurations are considered and the orbit adjust engines are not addressed. An important output of this study is the viable alternative thruster configurations which eliminate the need for the FPM. Initial results were derived using analytical techniques and simulation analysis tools. Results from the preliminary analysis were used as inputs for our 6DOF simulation. The 6DOF simulation was used to validate our design guidelines and to verify the performance of the thruster configurations. Author (revised)

Electro-optical sensors provide unique and critical functionality for space missions requiring rendezvous, docking, and berthing. McDonnell Douglas is developing a complete rendezvous and docking system for both manned and unmanned missions. This paper examines our sensor development and the systems and missions which benefit from rendezvous and docking sensors. Simulation results quantifying system performance improvements in key areas are given, with associated sensor performance requirements. A brief review of NASA-funded development activities and the current performance of electro-optical sensors for space applications is given. We will also describe current activities at McDonnell Douglas for a fully functional demonstration to address specific NASA mission needs. Author

A typical docking target employs a three-point design of retroreflective tape, one at each endpoint of the center-line, and one on the tip of the

central post. Scenes, sensed via laser diode illumination, produce pictures with spots corresponding to desired reflection from the retroreflectors and other reflections. Control corrections for each axis of the vehicle can then be properly applied if the desired spots are accurately tracked. However, initial acquisition of these three spots (detection and identification problem) are non-trivial under a severe noise environment. Signal-to-noise enhancement, accomplished by subtracting the non-illuminated scene from the target scene illuminated by laser diodes, can not eliminate every false spot. Hence, minimization of docking failures due to target mistracking would suggest needed inclusion of added processing features pertaining to target locations. In this paper, we present a concurrent processing scheme for a modified docking target scene which could lead to a perfect docking system. Since the non-illuminated target scene is already available, adding another feature to the three-point design by marking two non-reflective lines, one between the two end-points and one from the tip of the central post to the center-line, would allow this line feature to be picked-up only when capturing the background scene (sensor data without laser illumination). Therefore, instead of performing the image subtraction to generate a picture with a high signal-to-noise ratio, a processed line-image based on the robust line detection technique (Hough transform) can be used to fuse with the actively sensed three-point target image to deduce the true locations of the docking target. This dual-channel confirmation scheme is necessary if a fail-safe system is to be realized from both the sensing and processing point-of-views. Detailed algorithms and preliminary results are presented.

AUTONOMOUS RECONFIGURABLE GPS/INS NAVIGATION AND POINTING SYSTEM FOR RENDEZVOUS AND DOCKING Abstract Only **c17**

Triveni N. Upadhyay (Mayflower Communications Co., Inc., Reading, MA.), Stephen Cotterill (Mayflower Communications Co., Inc., Reading, MA.), and A. Wayne Deaton *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 2 p (For primary document see N93-22226 08-12)

Avail: CASI HC A01/MF A03

This paper describes the results of an integrated navigation and pointing system software development effort sponsored by the NASA MSFC through a SBIR Phase 2 Program. The integrated Global Positioning System (GPS)/Inertial Navigation System (INS) implements an autonomous navigation filter that is reconfigurable in real-time to accommodate mission contingencies. An onboard expert system monitors the spacecraft status and reconfigures the navigation filter accordingly, to optimize the system performance. The navigation filter is a multi-mode Kalman filter to estimate the spacecraft position, velocity, and attitude. Three different GPS-based attitude determination techniques, namely, velocity vector matching, attitude vector matching, and interferometric processing, are implemented to encompass different mission contingencies. The integrated GPS/INS navigation filter will use any of these techniques depending on the mission phase and the state of the sensors. The first technique, velocity vector matching, uses the GPS velocity measurement to estimate the INS velocity errors and exploits the correlation between INS velocity and attitude errors to estimate the attitude. The second technique, attitude vector matching, uses INS gyro measurements and GPS carrier phase (integrated Doppler) measurements during a spacecraft rotation maneuver to determine the attitude. Both of these techniques require only one GPS antenna onboard to determine the spacecraft attitude. The third technique, interferometric processing, requires use of multiple GPS antennae. In order to determine 3-axis body attitude, three GPS antennae (2 no-coplanor baselines) are required.

A BERTHING AND FASTENING STRATEGY FOR ORBITAL REPLACEMENT UNITS Abstract Only **c18**

John Vranish and Edward Cheung *In* NASA, Washington, NASA Automated Rendezvous and Capture Review. A Compilation of the Abstracts 1991 1 p (For primary document see N93-22226 08-12)

Avail: CASI HC A01/MF A03

Research in the area of berthing of Orbital Replacement Units (ORU's) at the GSFC consists of two major parts. First, we concentrate on the development of a comprehensive fastening strategy that can provide both mechanical as well as electrical connection to the ORU. Second, our efforts in robot collision avoidance and motion planning have led to the development of a state-of-the-art capacitive proximity sensor with associated motion control algorithms. These efforts combine to produce a system that allows safe and reliable machine assisted berthing. Although our main emphasis was on berthing of ORU's, we believe that some of our results can also be applied to docking.

A great deal of attention has been paid to navigation during the close approach (less than or equal to 1 km) phase of spacecraft rendezvous. However, most spacecraft also require a navigation system which provides the necessary accuracy for placing both satellites within the range of the docking sensors. The Microcosm Autonomous Navigation System (MANS) is an on-board system which uses Earth-referenced attitude sensing hardware to provide precision orbit and attitude determination. The system is capable of functioning from LEO to GEO and beyond. Performance depends on the number of available sensors as well as mission geometry; however, extensive simulations have shown that MANS will provide 100 m to 400 m (3(sigma)) position accuracy and 0.03 to 0.07 deg (3(sigma)) attitude accuracy in low Earth orbit. The system is independent of any external source, including GPS. MANS is expected to have a significant impact on ground operations costs, mission definition and design, survivability, and the potential development of very low-cost, fully autonomous spacecraft.

As a result of past space missions and evaluations, many procedures have been established and shown to be prudent applications for use in present and future space environment scenarios. However, recent procedures to employ the use of robotics to assist crewmembers in performing tasks which require viewing remote and obstructed locations have led to a need to pursue alternative methods to assist in these operations. One of those techniques which is under development entails incorporating the use of suitable lighting aids/techniques with a closed circuit television (CCTV) camera/monitor system to supervise the robotics operations. The capability to provide adequate lighting during grappling, deploying, docking and berthing operations under all on-orbit illumination conditions is essential to a successful mission. Using automated devices such as the Remote Manipulator System (RMS) to dock and berth a vehicle during payload retrieval, under nighttime, earthshine, solar, or artificial illumination conditions can become a cumbersome task without first incorporating lighting techniques that provide the proper target illumination, orientation, and alignment cues. Studies indicate that the use of visual aids such as the CCTV with a pretested and properly oriented lighting system can decrease the time necessary to accomplish grappling tasks. Evaluations have been and continue to be performed to assess the various on-orbit conditions in order to predict and determine the appropriate lighting techniques and viewing angles necessary to assist crewmembers in payload operations.

General Dynamics has developed advanced hardware, software, and algorithms for use with the Tomahawk cruise missile and other unmanned vehicles. We have applied this technology to the problem of locating and determining the orientation of the docking port of a target vehicle with respect to an approaching spacecraft. The system described in this presentation utilizes a multi-processor based computer to digitize and process television imagery and extract parameters such as range to the target vehicle, approach, velocity, and pitch and yaw angles. The processor is based on the Inmos T-800 Transputer and is configured as a loosely coupled array. Each processor operates asynchronously and has its own local memory. This allows additional processors to be easily added if additional processing power is required for more complex tasks. Total system throughput is approximately 100 MIPS (scalar) and 60 MFLOPS and can be expanded as desired. The algorithm implemented on the system uses a unique adaptive thresholding technique to locate the target vehicle and determine the approximate position of the docking port. A target pattern surrounding the port is than analyzed in the imagery to determine the range and orientation of the target. This information is passed to an autopilot which uses it to perform course and speed corrections. Future upgrades to the processor are described which will enhance its capabilities for a variety of missions. Author (revised)

This report presents a detailed demonstration test plan for receiving and processing data from experiments being conducted on the Space Transportation System near real time at the NASA Langley Research Center (LaRC). This task can readily be achieved using the Orbital Acceleration Research Experiment (OARE). The Space Shuttle data flow is described including both the payload and the mission data. A description is presented of the OARE instrument which is used to measure low frequency Space Shuttle accelerations in nano-gs. Procedures are shown for obtaining the required mission data and OARE paylcad data at LaRC. The demonstration test plan schedule and costs are presented. It is recommended that both the OARE data and the pertinent Space Shuttle mission data be received at LaRC over the NASA Communication System (NASCOM) on a near real time basis. Author

The Office of Space Science and Applications (OSSA) is responsible for the overall planning, directing, executing, and evaluating that part of the overall NASA program that has the goal of using the unique characteristics of the space environment to conduct a scientific study of the universe, to understand how the Earth works as an integrated system, to solve practical problems on Earth, and to provide the scientific and technological research foundation for expanding human presence beyond Earth orbit into the solar system. OSSA guides its program toward leadership through its pursuit of excellence across the full spectrum of disciplines. OSSA pursues these goals through an integrated program of ground-based laboratory research and experimentation, suborbital flight of instruments on airplanes, balloons, and sounding rockets; flight of instruments and the conduct of research on the Shuttle/Spacelab system and on Space Station Freedom; and development and flight of automated Earth-orbiting and interplanetary spacecraft. The OSSA program is conducted with the participation and support of other Government agencies and facilities, universities throughout the United States, the aerospace contractor community, and all of NASA's nine Centers. In addition, OSSA operates with substantial international participation in many aspects of our Space Science and Applications Program. OSSA's programs currently in operation, those approved for development, and those planned for future missions are described. Derived from text

TRANSPORTATION TECHNOLOGY PROGRAM: STRATEGIC PLAN
Sep. 1991 98 p
(NASA-TM-108706; NAS 1.15:108706) Avail: CASI HC A05/MF A02

The purpose of this report is to define the technology program required to meet the transportation technology needs for current and future civil space missions. It is a part of an integrated plan, prepared by NASA in part in response to the Augustine Committee recommendations, to describe and advocate expanded and more aggressive efforts in the development of advanced space technologies. This expanded program will provide a technology basis for future space missions to which the U.S. aspires, and will help to regain technology leadership for the U.S. on a broader front. The six aspects of this integrated program/plan deal with focused technologies to support space sciences, exploration, transportation, platforms, and operations as well as provide a Research and Technology Base Program. This volume describes the technologies needed to support transportation systems, e.g., technologies needed for upgrades to current transportation systems and to provide reliable and efficient transportation for future space missions. The Office of Aeronautics, Exploration, and Technology (OAET) solicited technology needs from the major agency technology users and the aerospace industry community and formed a transportation technology team (appendix A) to develop a technology program to respond to those needs related to transportation technologies. This report addresses the results of that team activity. It is a strategic plan intended for use as a planning document rather than as a project management tool. It is anticipated that this document will be primarily utilized by research & technology (R&T) management at the various NASA Centers as well as by officials at NASA Headquarters and by industry in planning their corporate Independent Research and Development (IR&D) investments. RESEARCH AND TECHNOLOGY GOALS AND OBJECTIVES FOR INTEGRATED VEHICLE HEALTH MANAGEMENT (IVHM)
10 Oct. 1992 32 p Prepared in cooperation with Orbital Technologies Corp., Madison, WI

(Contract NASw-4470)
(NASA-CR-192656; NAS 1.26:192656) Avail: CASI HC A03/MF A01

Integrated Vehicle Health Management (IVHM) is defined herein as the capability to efficiently perform checkout, testing, and monitoring of space transportation vehicles, subsystems, and components before, during, and after operational This includes the ability to perform timely status determination, diagnostics, and prognostics. IVHM must support fault-tolerant response including system/subsystem reconfiguration to prevent catastrophic failures; and IVHM must support the planning and scheduling of post-operational maintenance. The purpose of this document is to establish the rationale for IVHM and IVHM research and technology planning, and to develop technical goals and objectives. This document is prepared to provide a broad overview of IVHM for technology and advanced development activities and, more specifically, to provide a planning reference from an avionics viewpoint under the OAST Transportation Technology Program Strategic Plan. FIRST LUNAR OUTPOST SUPPORT STUDY
Christopher Bartz, John Cook, and Jean-Luc Rusingizandekwe Apr. 1993 80 p
(Grant NAG9-591)
(NASA-CR-192843; NAS 1.26:192843) Avail: CASI HC A05/MF A01

The First Lunar Outpost (FLO) is the first manned step in the accomplishment of the Space Exploration Initiative, the Vice President's directive to NASA on the 20th anniversary of the Apollo moon landing. FLO's broad objectives are the establishment of a permanent human presence on the moon, supporting the utilization of extraterrestrial resources in a long-term, sustained program. The primary objective is to emplace and validate the first elements of a man tended outpost on the lunar surface to provide the basis for: (1) establishing, maintaining and expanding human activities and influence across the surface; (2) establishing, maintaining and enhancing human safety and productivity; (3) accommodating space transportation operations to and from the surface; (4) accommodating production of scientific information; (5) exploiting in-situ resources. Secondary objectives are: (1) to conduct local, small scale science (including life science); (2) In-situ resource utilization (ISRU) demonstrations; (3) engineering and operations tests; (4) to characterize the local environment; and (5) to explore locally. The current work is part of ongoing research at the Sasakawa International Center for Space Architecture supporting NASA's First Lunar Outpost initiative. Research at SICSA supporting the First Lunar Outpost initiative has been funded through the Space Exploration Initiatives office at Johnson Space Center. The objectives of the current study are to further develop a module concept from an evaluation of volumetric and programmatic requirements, and pursue a high fidelity design of this concept, with the intention of providing a high fidelity design mockup to research planetary design issues and evaluate future design concepts. This discussion addresses the question of whether or not the space industry will take up the slack in the aerospace industry that is created by budget cuts in defense. Armed forces' research has provided an invaluable base for national technological and engineering resources for aerospace companies. It is noted that the space program should maximize the country's advances in national, scientific, and technical capabilities. It is also noted that NASA has done well in a most complicated business, but that Congress has failed to make a firm commitment to NASA's plans outlined in Vision 21 (based on the Augustine report) as evidenced by the Congressional reactions to NASA's budget requests. International cooperation and competition are discussed as well as the need for a political concensus on the direction of the space program in the U.S. CASI

Activities and National Aeronautics and Space Administration (NASA) programs, both ongoing and planned, are described by NASA administrative personnel from the offices of Space Science and Applications, Space Systems Development, Space Flight, Exploration, and from the Johnson Space Center. NASA's multi-year strategic plan, called Vision 21, is also discussed. It proposes to use the unique perspective of space to better understand Earth. Among the NASA programs mentioned are the Magellan to Venus and Galileo to Jupiter spacecraft, the Cosmic Background Explorer, Pegsat (the first Pegasus payload), Hubble, the Joint U.S./German ROSAT X-ray Mission, Ulysses to Jupiter and over the sun, the Astro-Spacelab Mission, and the Gamma Ray Observatory. Copies of viewgraphs that illustrate some of these missions, and others, are provided. Also discussed were life science research plans, economic factors as they relate to space missions, and the outlook for international cooperation. CASI

INTERNATIONAL COOPERATION AND COMMITMENTS IN THE ISY AND BEYOND
John L. McLucas (External Tanks Corp., Alexandria, VA.), Hiroe Fujioka (Institute for Future Technology, Tokyo, Japan.), Ian Pryke (European Space Agency, Washington, DC.), and Dietmar Wurzel (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Washington, DC.) *In its* The Eighth National Space Symposium 1992 p 210-221 (For primary document see N93-23156 08-12)
Copyright Avail: CASI HC A03/MF A03; 7 functional color pages

The question of international pooling of resources for space missions is addressed. The impetus towards such cooperation is both financial and technological. Functions, examples, plans, and objectives for international cooperation are discussed, and the European Space Agency (ESA) is presented as an example of successful cooperation among nations in pursuit of common space-related goals. The International Space Year is also mentioned. Its theme is space and the service of the changing Earth. CASI

PUBLIC CONGRESSIONAL FORUM ON SPACE
Jake Garn (Congress of the United States, Washington, DC.), Hank Brown (Congress of the United States, Washington, DC.), Joel Hefley (Congress of the United States, Washington, DC.), and Jim Chapman (Congress of the United States, Washington, DC.) *In its* The Eighth National Space Symposium 1992 p 223-256 (For primary document see N93-23156 08-12)
Copyright Avail: CASI HC A03/MF A03; 7 functional color pages

The discussion began with comments on the returns to the private sector of eight or nine dollars for every dollar spent on the space program, on the lack of knowledge or understanding evidenced by both the public and people in Congress of the benefits resulting from the space program, and on the seriousness of the U.S. budget problems. The second speaker focussed on projects that he felt are top priorities: ballistic missile defense, research in the use of space, and the development of new power plants, new engines, and new means of propulsion. The next speaker stressed the need for consensus and unified commitment on a national space goal. The final speaker addressed the money problems. He expressed the hope that the final programs and policies that the nation decided upon would both make sense and be affordable. CASI

(NASA-TM-108656; NAS 1.15:108656) Avail: CASI HC A06/MF A02

The Office of Space Science and Applications (OSSA) is responsible for planning, directing, executing, and evaluating that part of the overall NASA program that has as its goal the use of the unique characteristics of the space environment to conduct a scientific study of the universe, to solve practical problems on Earth, and to provide the scientific research foundation for expanding human presence beyond Earth into the solar system. OSSA manages the development of NASA's flight instrumentation for space science and applications including free flying spacecraft, Shuttle and Space Station payloads, and the suborbital sounding rockets, balloons, and aircraft programs. A summary is provided of future flight missions, including those approved and currently under development and those which appear in the OSSA strategic plan. Author

ENVIRONMENT OBSERVATION AND CLIMATE MODELLING THROUGH INTERNATIONAL SPACE PROJECTS. COLUMBUS EIGHT (COSY-8): UTILISATION OF EARTH ORBITING LABORATORIES
T. Duc Guyenne, ed. and James J. Hunt, ed. Jul. 1992 366 p Conference held in Munich, Germany, 30 Mar. - 4 Apr. 1992; sponsored by EEC, ESA, Deutsche Agentur fuer Raumfahrtangelegenheiten, and the European Association for the International Space Year

(ESA-ISY-4; ETN-93-93507) Copyright Avail: CASI HC A16/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The European International Space Year conference was held with the specific theme of the practical use of space derived information for environmental research and monitoring and resource management. This main theme, 'Mission to Planet Earth,' was maintained, but it was recognized that other fields needed to be equally addressed to provide a balanced view on space activities. Space sciences, space navigation and communications, and manned space activities were also represented. The present volume focuses on the utilization aspects of Columbus and of the precursor flights Spacelab and Eureca. Other Earth orbiting laboratories, notably the Space Station Mir, are also addressed. Climate modeling, high energy astrophysics, and manned spaceflight are addressed. The need to find a sensible equilibrium between development, operations, and utilization, and on the other hand between cost, capability, and utilization return is stressed. For individual titles, see N93-24337 through N93-24406.

COLUMBUS PROGRAMME OVERVIEW **c45**

F. Engstroem *In its* Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 9-10 (For primary document see N93-24336 08-12)

Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The main events which have characterized the Columbus program over the last year are summarized. Since the proposal was deemed too expensive, modifications in the technical baseline and, consequently, an updating of the cost estimates were performed. The present situation is clarified: continuity along the established baseline with, in addition, a perspective of a budgetary austerity over the next 3 to 4 years and the encouragement of international cooperation. The plan and perspective for future development of the Columbus program are addressed: these include discussions with the Russians on work towards the Free Flyer baseline and on more regular utilization of the Space Station Mir by ESA astronauts; and the need of precursor flights to respond to user needs for opportunities, both in microgravity and the technology demonstration areas. THE PROSPECTS OF THE COLUMBUS PROGRAMME TEN YEARS AFTER ITS INITIATION **c18**

Ernesto Vallerani *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 11-14 (For primary document see N93-24336 08-12)

Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

A possible evolution of Columbus, bearing in mind the changes in the situation that have occurred over the last decade, is described. The ultimate goals that the program can realistically achieve in the international exploitation of space are focused upon. The large infrastructures which were conceived many years ago as an area of international cooperation in the conquest of space, and which started at the beginning of the 1980's with the Space Station and Columbus programs, have undergone a difficult development over the last decade and have had to suffer the resulting delays. The economic difficulties which faced the spacefaring nations, including Europe, in this period have led to much replanning and reprogramming which, together with the upheavals in the East, have demanded a rethinking of the strategies to achieve the original goals as fully as possible. The role of the Columbus Attached laboratory, or Attached Pressurized Module, as a European contribution to Space Station Freedom, in its new configuration dictated by the problems the U.S. has had to confront, is highlighted as an area for new strategies. Its basic features and characteristics are described. With regard to the Free Flying Laboratory, the prospects for this element will be the subject of new thinking, especially in the light of new international cooperation. ESA

JEM PROGRAM STATUS **c18**

Masatoshi Saito *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 15-18 (For primary document see N93-24336 08-12)

Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Progress in the Japanese Experimental Module (JEM) program is addressed. The JEM contractor Preliminary Design Review (PDR) has been completed; construction of JEM operation facilities has begun, and the micro G airplane, drop shaft, and micro G sounding rocket are all in operation. The national policy for JEM utilization will soon be established. The space Experiment Laboratory (SEL) will open in Jun. 1992 and will function as a user support center. Eight JEM multiuser facilities are in phase B. Seventeen candidate multiuser facilities are going to be defined as to scientific requirements. The national Joint Research Program is about to start. Precursor mission and early Space Station utilization activities are being defined. ESA

USER SUPPORT FOR THE SPACELAB MISSION D-2 **c29**

D. Padeken, M. Schuber, F. Gillessen, R. Naehle, and G. Schmitz *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 19-24 (For primary document see N93-24336 08-12)

Copyright Avail: CASI HC A02/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The Microgravity User Support Center (MUSC), which supports 75 experiments on five multiuser facilities onboard Spacelab-2, is addressed. The user support program started in early 1988 with classical tasks such as parameter definition. The engineering models (EM's) of the flight facilities (the functionally equivalent hardware), the key elements of the whole user support program used throughout all phases of the mission, for experiment preparation, experiment execution, and experiment evaluation, are addressed. Details of each of these experiment stages are given. The EM's at MUSC are embedded within a 'living' laboratory environment. Additionally, MUSC developed tools for data handling, facility commanding, and data evaluation complement the infrastructure for the operation of the EM's. These tools are the GSPE (Ground Support Program Equipment) and the HOLOP telescience workstation. They are prerequisites for the operation of space experiments in the telescience mode and became an internal standard within MUSC. This year the user support program will focus on the preparation of mission support and on ground reference experiments like Baseline Data Collection (BDC) and Experiment Sequence Tests (EST). ESA

COLUMBUS PRECURSOR SPACELAB MISSIONS

W. U. Klein and V. Sobick (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Cologne, Germany.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 27-30 (For primary document see N93-24336 08-12)

Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The use of the Columbus precursor Spacelab missions in performing the interlink between standard Spacelab missions as represented by the missions D1 and D2 and crewed Columbus utilization is discussed. These missions, which preliminarily provide for repetitive flight opportunities to the user community, shall prepare the Space Station era with respect to technical concepts, involvement of user and engineering centers and modified operations. A core payload for Spacelab mission E1 consisting of different multiuser facilities and stand alone instruments has been roughly accommodated. This serves as the basis for further iterations with respect to a balanced utilization of the onboard resources by experiments from different disciplines. ESA

THE ROLE OF THE APM CENTRE TO SUPPORT COLUMBUS PRECURSOR FLIGHTS **c14**
Giovanni Rum, Claudio Canu, Luciano Battocchio (Alenia Spazio S.p.A., Turin, Italy.), and Mario Cardano (Alenia Spazio S.p.A., Turin, Italy.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 41-47 (For primary document see N93-24336 08-12)
Copyright Avail: CASI HC A02/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The responsibilities of the APM Center (APMC), which is the engineering support center for the Columbus Attached Laboratory (APM), in the context of Spacelab mission E1 are described. Comparisons are made with analogous Columbus activities. The APMC will be one of the most important European ground facilities for the support of the Columbus Attached laboratory. The APMC will act as the system reference. Additionally, it will support the onboard operations through the engineering and logistics support functions. Finally. the APMC will play a key role for the payload integration, performing both the payload analytical integration and the final acceptance of the payload elements before shipping to the U.S. for the integration on the Logistic Carrier. As the Spacelab mission E1 is a Columbus precursor flight, it will be a unique opportunity to test at least two of the main functions of the APMC, namely the payload integration support and the engineering support. THE EUROPEAN ASTRONAUTS TRAINING PROGRAMME **c53**
K. Damian, O. Chiarenza, H. Arend, and P. Nespoli *In its* Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 55-61 (For primary document see N93-24336 08-12)
Copyright Avail: CASI HC A02/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

An overview of the overall training program for European astronauts--who include laboratory specialists and spaceplane specialists-- is given. The laboratory specialists are primarily specialized in the servicing and operation of the Columbus Free Flying Laboratory as well as the Columbus Attached Laboratory and of the other elements of the Space Station Fredom manned base. The Spaceplane specialists are primarily concerned with the operations of the European spaceplane Hermes. The training program covers basic training, specialized training, mission training, and proficiency maintenance. The structure and major contents of the training phases are explained. Basic training provides basic knowledge of space technology and science and basic skills related to future operational tasks. Specialized training provides knowledge and skills related to specific space elements and specific types of missions. Mission training provides the knowledge and skills required to perform a specific mission/increment. An overview of the training facilities which will be used during the training program is also given. ESA

The purpose and concepts of the Crew Training Complex (CTC) facilities at Cologne (Germany, F.R.), which are to be used for the training of the European astronauts for the Columbus and Hermes missions, are addressed. The integrated system training facilities for the Attached Pressurized Module (APM), for the Man Tended Free Flyer (MTFF), and for Hermes are discussed. Facilities for space environment training, such as the Neutral Buoyancy Facility and Space Suit Training Facility, are considered. The computer aided instruction facilities and courses, which will be used to support the practical training of inflight operations, are addressed. The CTC data handling and communication systems, which provide the possibility for the operations personnel to supervise and control all CTC training facilities, are described. ESA

MIR '92 PROJECT
H. Binnenbruck, H.-W. Gronert, and C. Nitzschke *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 79-81 Sponsored by BMFT (For primary document see N93-24336 08-12)
Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The mission goals, characteristics, organization, and execution of Mir '92, the first joint project of Germany with organizations of the Commonwealth of Independent States (the former Soviet Union) in the field of manned space flight are addressed. Mir '92 was the 8 day mission of a German cosmonaut to the Mir Space station which included a scientific experimental program consisting of 14 experiments dedicated to space medicine. The mission was successfully performed during 17-25 Mar. 1992. The project tasks of Mir '92 were grouped mainly into two parts: crew preparation and operation activities; and the experimental program. The German Mir '92 should be considered an important step towards space station utilization in the upcoming Columbus era. ESA

The one week visit of the Austrian cosmonaut Franz Viehboeck to the Space Station Mir which began on 2 Oct. 1991 is addessed. Details of the experimental objectives and applications of comosnaut qualifications and of the flight schedule are given. For this flight, out of 34 scientific experiments, 14 were chosen to be performed by the cosmonaut, mainly in the field of life sciences, but also in physics, material science, and remote sensing. All of them performed extremely well and the mission can be considered a full success. Preliminary data reported showed very interresting results. The cooperation with the Soviet scientists and engineers was an extremely cordial and efficient one, a fact which, along with the outstanding performance of the crew, contributed very much to the success of the mission. ESA

PHYSIOLOGICAL EXPERIMENTS WITHIN THE PROJECT AUSTROMIR **c52**
I. C. Pestov *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 97-100 (For primary document see N93-24336 08-12)
Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The ten medical experiments performed during the joint Soviet-Austrian mission to the orbital Space Station Mir are addressed. Their scientific aims are discussed and their time requirements and experimenters addressed. The aim was to gain new scientific material to assess the influencing factors of a space flight on the human motoric functions, the senses, the blood circulation, higher psychological functions, the volume regulation, the genetic functions, and on an advanced system for the dosimetric control of a space flight. The selected range of tasks covered most topical problems in the field of space medicine and gravitational biology of interest for the general health management both in theory and practice. The results of the research performed improve the picture of the physiological changes which occur during the adaptation of man to weightlessness. This information furthermore allows us to prepare recommendations for a system for the medical supervision of the state of the cosmonaut during the flight. ESA

The coordination of design, development, and testing of hardware to form the AustroMir 91 payload is discussed. An extremely tight time schedule (within 30 months definition, design, development, and testing of more than 10 hardware subsystems had to be completed) made very flexible operation necessary. Five units of each instrument had to be developed and tested: a mockup, a technological unit, a model used for cosmonaut training, a flight unit, and a spare flight unit. All technical specifications and testing procedures had to be coordinated with Soviet experts with respect to the special requirements of Soviet astronautics. Among others, test procedures included acceptance tests in Austria and the Soviet Union, space qualification tests, such as thermal, vacuum, electrical, outgassing, shock and vibration tests, and integration tests in spacecraft simulation units in Moscow (USSR). In spite of the enormous deadline pressure for the preparation of hardware for the first Austro-Soviet manned spaceflight, all systems were qualified on time and taken to the Space Station Mir where they worked without any failure during the whole mission. The payload is presently (Spring 1992) used for continued microgravity investigations onboard in Soviet long term missions and is still working without any problems. ESA

The hardware and software design and onboard operation of the common control computer system called DataMir, used in several experiments in the AustroMir project, are discussed. The device is based on IBM compatible industrial computer system. It is the first time, an MS-DOS compatible computer with a link to the on board telemetry system is available on Space Station Mir. A flexible software package supports experiment preparation and execution, including experiment dedicated instructions usually written to the board journal. Serial links enable data exhange with extern units and offers data transfer to the telemetry via standard interfaces. ESA

The experiment LOGION, operated during the AustroMir 91 mission, is described. The experiment was the first test ever of a Liquid Metal Ions Source (LMIS) under microgravity conditions. A module containing two indium ion emitters and an integrated ion beam collector was mounted on a hermetic, ion pumped vacumm system. All essential operating parameters were measured in 1 second intervals. The experiment has a total mass of 14.7 kg and a power consumption of 10 W. The emitters alone require only 0.5 microA. First, evaluated flight results showed that operational parameters of the LMIS were within the range observed on ground. Ion beam stability at nominal 10 microA emission was of the order of 5 percent and operating voltages were between 6 and 8 kV. ESA

The experiment Migmas-A, the main component of a planned microanalytical analysis station (scanning ion microprobe) operated onboard Mir for investigation of space corrosion is addressed. In its present configuration, it performs the functions of a scanning ion microscope and consists of an ion emitter of the liquid metal field emitter type, a single stage electrostatic ion focusing systems, a quadropole scanning system, and a sample holder. The instrument can display and record high resolution topographic images of material samples. All instrument functions are controlled by an internal microprocessor. Operator interfacing is via menus displayed on the integrated electroluminescent display. During the flight, data were recorded in two 1/2 MB memcards and also were transferred to the central data processor for storage and telemetry. First, flight data are presented, showing excellent focusing and stability properties. ESA

Copyright Avail: CASI HC A02/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The remote sensing experiment which took place during AustroMir, the Austrian Soviet mission to the Space Station Mir in 1991, is described. Details of scientific objectives and instruments are given. This FEM experiment studied the coherence of synergetic data in a multisensoral dataset. During several passes over Austrian territory, either the multispectral camera or a mapping camera, as well as the two spectrometers, were in operation on the station. In Austria, radiometric measurements on ground, photographic surveying flights at different levels, and ascents of meteorologic balloons were carried out simultaneously. In addition, a terrestrial inventory of the phenologic situation was performed. Thus, during the whole mission a multisensoral dataset was recorded, by which various models and methods for radiometric or geometric calibration may be examined and improved. The material obtained is presented, and first statements about the quality are made. ESA

The method and results of the MoniMir experiment, part of the investigation program of the Austrian Soviet spaceflight in Oct. 1991, which investigated the adaptation and readaptation of eye, head, and arm movements, are presented. The movements are highly coordinated under the control of visual, vestibular, and proprioceptive systems. Disturbances on the vestibular and proprioceptive systems caused by weightlessness during spaceflight are responsible for initial movement disorders in space. Visual information is primarily responsible for adaptation of the sensory motor system. Special hardware was developed for the presentation of standardized visual signals and for registration of eye, head, and arm movements. Preprogrammed movements, tracking movements, memorization of movements, and the influence of neck reflexes on arm movements were investigated. Analysis of accuracy, velocity, reproducibility of eye, head, and arm movements, and their changes during and after spaceflight gives further information on the adaptive process of the sensory motor system. The MotoMir experiment, developed in the framework of the Austrian-Russian space program, is described. The purpose was to investigate the force-angle velocity relationship of human musculature in and against a predetermined pattern of translatoric movement (concentric and eccentric exercise), and the correlation of the results with neurophysiological data obtained by integrated surface Electromyogram (EMG). A further goal was to answer questions pertaining to muscular fatigue in the zero gravity environment, contrasting force decrease with different EMG parameters during different work modes. The ultimate purpose was to develop concepts which can be applied to the training of astronauts, of athletes, and to the rehabilitation after injuries. Hardware development was based on an existing ground based prototype ergometer with which clinical tests and test with athletes were conducted. Extensive redesign was necessary which resulted in a firmware controlled ergometer with design characteristics allowing the optical use of the zero gravity environment. The following tests were performed: a cyclic leg and arm work in concentric and eccentric work mode depending on different angles and angle velocities; cyclic leg and arm work in three different submaximal intensities, both in eccentric and concentric work mode. Methods, data acquisition, data analysis, and preliminary results are discussed and compared with preflight and postflight investigations. ESA

Nonspecific (attention psychomotor speed) and specific (mental flexibility, time estimation, visuospatial perception, and memory) cognitive functions were measured in a single case study during a six day visit on the Russian orbital complex Mir using computer based psychometric tasks. Reaction times and accuracy scores showed only minor, nonsignificant exchanges between preflight, flight, and postflight measurements. These results suggest that several important cognitive functions, among them complex visuospatial processing skills remain essentially unimpaired during short space visits, provided that physical conditions are stable during the period of microgravity. Computerized psychometric tasks are a highly sensitive and flexible tool to measure behavioral functions in space life science. ESA

Copyright Avail: CASI HC A02/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The AudiMir experiment, the first investigation of the auditory system as part of the human orientation system at microgravity, which was performed during the Austromir space mission in Oct. 1991, is described. The project started from the assumption that, in the absence of gravity, orientation by acoustic cues would play a much more important role for a human being than on Earth. The technical realization of the project was based on the presentation of binaurally processed signals over headphones. For the horizontal plane, nonsignificant localization errors were found while a downwards displacement was observed in median plane elevation judgments. The second phase of the experiment for the first time proved the phenomenon that human dynamic orientation can be influenced by audiokinetic stimulation. At microgravity, auditory orientation evidently is of special significance. Further research will have to show whether this discovery will be of any use for future space travel. ESA

OPTOVERT: AN AUSTROMIR-1991 EXPERIMENT. ORIENTATIONAL EFFECTS FROM OPTOKINETIC STIMULATION **c53**

C. Mueller, L. Kornilova (Institute of Biomedical Problems, Moscow, USSR.), G. Wiest, and L. Deecke *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 163-167 (For primary document see N93-24336 08-12)

Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The Optovert experiment carried out on the third and fifth day of the Austromir 91 space flight is described. The main aim of the experiment was to explore in microgravity the vertical vection illusion which was elicited by means of an optokinetic stimulator system. The cosmonaut was instructed to fixate a central light emitting diode on a spherical screen (60 deg of visual angle in diameter) during up and down motion of a dot pattern. In addition optokinetically induced eye movements were examined as well as the ability for setting the visual vertical correctly. A slight preponderance for downward vection and the occurrence of inverted vection with extreme phase shift during sinusoidal stimulation were considered to be the most striking orientational phenomena in flight. Two experiments performed during the Austrian-Russian space flight AustroMir in Oct. 1991 to investigate the physiological changes in the circulation under the conditions of microgravity are described: pulstrans, performed during the day, a complex experiment consisting of rest, variations of arm positions, handgrip ergometry and breathing maneuvers; and sleep, developed to observe the cosmonauts circulatory system during the night. The goal of the study was the monitoring of the cosmonauts adaptation to microgravity and the investigation of the physical properties of arm and leg arteries. The observed physiological changes in microgravity compared to upright position range from slightly decreased heat rate, decreased pulse wave velocity in the leg arteries and shifts in the cardiopulmonary coordination to changes in the heat orientation resulting in a marked increase in electrocardiogram amplitude. Arterial pulse transmission shows decreased peripheral resistance in microgravity. Post flight, a decrease of muscular strength and an obvious deconditioning of the circulation takes place, which results in an increase in heart rate above preflight values during day and night and in a shift in pulse-respiration quotient during sleep. ESA

Some forms of tremor were studied in the Austrian-Soviet orbital flight (AustroMir mission, Oct. 1991). Using two accelerometers fixed at the lower arm and a hand dynamometer, signals were recorded during positional and visual feedback tasks. During the flight tremor at rest (microvibration) shows no oscillations in the 8 to 12 Hz band. Physiological tremor in a postural task was reduced. Tremor in isometric load tests remained unchanged in the microgravity environment. ESA

Intercompartment fluid shifts and hormonal regulation were studied after lower body suction (-15/-30/-35 mm Hg for 15/15/10 min) in the Austrian cosmonaut preflight (supine), inflight (6th day in orbit), and 4th day postflight (supine). Antecubital blood was taken at the beginning (3 min) and after shut down (+2 min) of lower body negative pressure, respectively. Sound Velocity (SV, +/- 0.1 m/s) and temperature (+/- 0.03K) was immediately determined in whole blood and plasma. There was a 1.6 m/s increase in Blood Sound Velocity (BSV) preflight and a 4.0 m/s increase postflight whereas BSV stayed unchanged inflight. Plasma Sound Velocity (PSV) increased 1.2 m/s preflight and 1.7 m/s postflight, whereas PSV did not rise (-0.4 m/s) inflight, suggesting an inflight lack of hemo-concentration with lower body suction. Hormonal changes were partly different inflight as compared to pre and post flight. ESA

The effect of spaceflight on lymphocytes of the peripheral blood was investigated in the Austian cosmonaut flying the Austro-Soviet mission 'AustroMir'. Blood was sampled before and after flight, and the following parameters studied: quantities of lymphocytic subsets (T cells, helper cells, suppressor cells, B cells, and natural killer cells); mitogenic stimulation of lymphocytes, DNA (deoxyribonucleic acid) synthesis and expression of Interleukin 2 receptor; and structrural modification of DNA, unscheduled DNA synthesis, and sister chromatid exchanges. Besides reducing the number of natural killer cells, spaceflight caused an impairment of lymphocyte activity and a slight modification of DNA structure. Four weeks after flight, control values were reestablished, indicating efficient repair mechanisms. ESA

Two dosemeter packets containing Thermoluminescence Dosemeters (TLD's) and track etch foils were used to measure the absorbed dose and the average Linear Energy Transfer (LET) of the radiation within the Space

Station Mir. One packet was exposed over a period of about 5 months and the other one during the Austria-Soviet manned space program in Oct. 1991. Various types of standard TLD's, Soviet Al2O3 TLD's and Austrian labor made LiF single crystals were used. The change in the peak height ratio, phototransfered TL and glow peak deconvolution were used to measure the absorbed dose and the average LET of the radiation within the space station Mir. The first results taken by TLD's reveal a radiation dose of 1.6 mGy and an average LET of 7 keV/micrometers in tissue caused by the radiation field within the space station Mir during the mission. A personal opinion of the scope and role of microgravity research in materials science together with its industrial relevance and potential for application is presented. The meaning of microgravity is discussed and the parameters which specify a microgravity environment are considered: the magnitudes of the spectral components of the residual acceleration and the duration for which the microgravity level can be maintained. Requirements for an effective research program are discussed. Research topics suitable for microgravity are discussed. These include things which can not be done on Earth. Measurements of the coefficients in the following are considered suitable: Soret diffusion, ordinary Fickman diffusion, thermal conductivity, Dufour coefficient, and electrotransport coefficients. The range of materials would include metal alloys, molten oxides and salts, organic mixtures etc. Measurements in the vicinity of the critical point would be important in some systems. The second general area of research selected is the model experiment to determine the physics or physical chemistry involved in a process, for example directional solidification of monotectonics or segregation in crystal growth were the competing effects of natural convection or sedimentation on Earth so complicate the behavior that its fundamentals can not be unraveled. A telescience program conceived by the Microgravity Advanced Research and Support (MARS) Center and the Microgravity User Support Center (MUSC) to establish a preliminary infrastructure for decentralized facility operations and telescience for the Columbus precursor flights in spacelab and Eureca is addressed. The required activities and the equipment/tools needed for an efficient implementation of the telescience operative mode are discussed. This operational mode will be developed for a selected number of facilities and experiments, assuming the implementation of an adequate network of User Home Basis (UHB) and User Support and Operation Centers (USOC). Futhermore the establishment of an adequate interface between the user ground infrastructure and the mission control functions will play a major role. The precursor flights provide the opportunity to assess the feasibility of this concept for the Columbus era and to demonstrate the effectiveness of the provided services with respect to the user needs. After the technical feasibility of the decentralized user support was demonstrated, this study phase elaborated on questions with respect to the sharing of responsibilities and how to operate the different types of payloads. After working out an appropriate classification for payloads it is shown that a clear scheme about the distribution of responsibilities during the various phases of an experiment was found and that the payload operation can be performed in the vicinity of the researcher. The aspect of development support was picked up by the user support to minimize the development process. A list of the tasks to be performed in support of the development of experiments was compiled with a detailed description for each payload class. ESA

For the European User Support Organisation (USO) definition study, the payload flow of a plant bology model experiment planned for the Columbus Attached Laboratory (CAL), is described. The implementation of the user support functions from the initial scientific idea, through the operation in space, to the completion of the experiment on the ground and publication of the results, is described. The plant material consists of cell wall free plant cells (protoplasts) and their regeneration processes via cell cultures to new plants. Results obtained from preliminary work using clinostats on ground and under microgravity conditions onboard Biokosmos 9 and IML 1 on the Space Shuttle are included. Interpretation problems arising as a result of the hardware used and technical constraints are discussed within the USO concept. ESA

Based on the user Suport Organization (USO) definition concept, means by which user support for the precursor missions could be implemented are described. A survey of the facilities to be included in the Spacelab E1 and the Eureca 2 missions was performed. An overview of the national user support activities in Europe is given. It is assumed that this infrastructure can be applied for precursor mission support, as well. On the basis of the results of these two surveys, an exercise was executed to map the various support functions to be performed by the available utilization centers. In this work, the Facility Responsible Center and Experiment Support Center status was assigned to various centers. The results of the mapping exercise are presented. ESA

Training concepts developed by the European User Support Organisation (USO) definition team for crew, experimenters and for the user support personnel of the Utilisation Centers (UC), are addressed. The concept concentrates on experiment operation for the Attached Laboratory and the Free Flying Laboratory. Implementation of the training concept will depend on the trainees: laboratory specialists, new or experienced users and technical or administrative UC personel. The concepts, however, are based on the same fundamental principles: the training and lessons will be given directly by personnel who have expert knowledge and responsibility during the increment operation. The concept will not only minimize the educational period, but the complexity of the training will be restricted to the real

knowledge required by the trainees. The organization of the training will also minimize the number and duration of travels. ESA

Research performed in the Columbus environment will make continuous use of sophisticated computer equipment. 'Information handling' which is defined in the sense of an overall computer utilization perspective for user support, is considered. Information handling has to be provided for all building blocks of the foreseen European Utilisation Centers (UC's). For each building block an accompanying service concept has to be elaborated during the frame specification for a European utilization computer network. The specification effort shall lead to a clear and evolving design of modular computer based subsystems (e.g. for planning, commanding). Commonalities between different services shall improve development of flexible standard tools. The computer hardware configuration, the system and application software, the information processing personnel, etc., have to be organized in distributed entities forming a highly efficient performance network, where adequate coordination is mandatory. To ensure this objective the presented concept proposes and outlines four modern modeling approaches to capture the significant contour of distributed and cooperative systems for information processing. An organization, an activity/function, an information and a technology model shall be elaborated. The integration of these different viewpoints shall provide a template for the federation of distributed systems. ESA

FLUID SCIENCE USERS REQUIREMENTS **c34**
R. Monti and L. Carotenuto (Microgravity Advanced Research and Support Center, Naples, Italy.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 275-280 (For primary document see N93-24336 08-12)
Copyright Avail: CASI HC A02/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The microgravity fluid science concerns all the studies aimed at the understanding of influence of gravity levels in the properties and hydrodynamics of fluids or to exploit particular fluid behaviors occurring under reduced gravity levels to study new or weak phenomena usually masked by gravity. Classic fluid science experiment areas are discussed: thermodynamics; fluid mechanics and fluid chemistry. It is concluded that the scenario of fluid science experimentation is evolving, in the research areas in the gravitational level requirements and in the operative requirements. User requirements are evolving in view of a number of facts: extension of fluid science activities into nonconventional areas; increasing demand of characterization of residual accelerations; and change of the operational scenario foreseen for Columbus. It is suggested that all evolving requirements should be taken into account for the identification of fluid science facilities and of their operating mode. ESA

The phase A study report provided by scientists of different fields of physiology who were asked to provide a 'science study' for the Columbus payload requirements, is presented. The report concerns the Anthrolab, a laboratory that covers all presently known research challenges in the area. Anthrolab is more or less an improvement of the Anthrorack to be flown on the German Spacelab mission D-2 and on the Columbus precursor flight E-1. Beside the present Anthropack design Antrolab also will provide subelements for vestibular, neurophysiological, and biomechanical research. The main subelements and major devices of Anthrolab are listed: respiratory monitoring system, ultrasound monitoring system, liquid monitoring and processing system, neuromuscular laboratory, stimulation devices. Some scientific areas which might be investigated using this equipment are depicted. ESA

Six instruments for space sciences are presented as potential external payloads, which need accommodation on the Space Station Freedom (SSF) truss or on the Columbus Attached Laboratory (CAL) by means of a terrace or balcony: SUN (an interferometer with a baseline of 2m); ORFEUS (a stellar spectrometer); LOBSTER (a Large Angle Observatory for Bursts Supernova and Transient Event Researh); GAUSS (Galactic Ultrawide Schmidt System to feed a Schmidt camera); UTEF (Ultraviolet Telescope Facility); DUSTWATCH (a facility for exposing passive substrates and active particle detectors to the space environment). Three of them (ORFEUS, SUN, UTEF) require pointing platforms with 20 inch stability and capability of rotation around the line of sight. Two (GAUSS, LOBSTER) are satisfied with a pointing stability of 1 foot. For DUSTWATCH, SSF may be an acceptable platform. Two contamination aspects are of concern: degradation of ultraviolet (UV) coatings due to molecular deposition and increased background radiation due to local molecular and particulate scattaring and emission. The scientific objectives address forefront problems in a wide energy range from gamma rays, through X-rays and the extreme UV, down to the far UV and the UV. One instrument (SUN) is the European forerunner for UV imaging interferometry from space. ESA

THE SPACE ROBOT TECHNOLOGY EXPERIMENT (ROTEX) ON SPACELAB-MISSION D2 **c63**
G. Hirzinger *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 301-309 (For primary document see N93-24336 08-12)
Copyright Avail: CASI HC A02/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The overall configuration, sensory components, actuators and telerobotic concept of the ROTEX experiment, which is to fly on the Spacelab Mission D2 in Jan. 93, are addressed. ROTEX provides a small six axis robot within a rack of Spacelab. Its multisensory gripper containing stiff and compliant wrist force torque sensors, tactile sensors, 9 laser range finders and a pair of tiny stereo cameras is the basis of the robot's local sensor based autonomy. The robot is supposed to perform different rotortype tasks like assembly of a grid structure, connecting/disconnecting electrical plugs (bajonet closure), and capturing a free floating object. With these prototype tasks ROTEX is supposed to prepare the most typical applications for the future (assembly of structures, internal and external servicing, satellite retrieval and repair etc.). Depending on joint fraction models observed on board under zero G, the joint controllers are as well adaptable from ground as the external feedback loops using self learning techniques. The robot is operated in a number of different modes, e.g., executing preprogrammed paths teleoperated by astronauts, teleoperated from ground using advanced predictive stereographics for delay compensation, ground reprogramming and telesensorprogramming based on a complete 'virtual' environment including sensory simulation. The rich variety of nonlinear dynamical phenomena in a most simple configuration of convection driven by centrifugal buoyancy on the one hand, and its far reaching potential in explaining many of the remarkably regular features observed in the major planets on the other hand, are demonstrated. The problem of thermal convection driven by centrifugal buoyancy in rotating cylinders and spherical shells is reviewed and a number of unusual dynamic features are pointed out. In the case of the cylindrical annulus the transition to asymmetric convection gives rise to the generation of strong mean zonal flows which appear to be related to the observed zonal jets in the atmospheres of Jupiter and Saturn. Because many phenomena such as period doubling sequences and transitions to chaos can be described on the basis of a spatially two dimensional analysis, the convection problem also serves as a particularly attractive system for the study of nonlinear dynamics. Through numerical simulations and experimental studies the close correspondence between convection in rotating spheres and cylinders can be established. ESA

A short description of the program Stardust whose goal is to study the formation and properties of high temperature particles and gases, including silicate and carbonaceous materials, that are of interest in astrophysics and planetary science, is given. The international program was carried out in microgravity conditions in parabolic flight. A description of the laboratory equipment, conceived to perform experimental tests in reduced gravity conditions, and which is based on the gas evaporation technique, is given. The gas evaporation technique utilizes one or more heated crucible to vaporize solids materials (SiO, Mg) in a low pressure of inert or reactive gas inside of a vacuum bell jar. The vapor pressures of the materials are controlled by the temperature of the crucibles. The temperature and pressure of inert gas are also controlled. By varying the vapor pressure relative to the gas temperature and pressure, the conditions for substantial grain condensation can be controlled and grain formation measured using light scattering techniques. Thus the partial pressure for grain condensation, can be measured as a function of temperature. The gas evaporation technique has the advantage that complex chemical systems can be studied by using multiple crucibles each containing solid source material. Experimental results and future trends are addressed. ESA

CONTROL OF THE CONCENTRATION GRADIENT DURING CRYSTAL GROWTH FROM SOLUTION **c76**
F. Bedarida, G. A. DallAglio, A. C. Hernandes (Sao Paulo Univ., Brazil.), E. Piano, and C. Pontiggia *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 331-334 (For primary document see N93-24336 08-12)
Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The growth of a HgI2 crystal from solution is studied in coherent light with a new optical schema. A laser beam crosses the solution where the crystal is growing. The beam is there diffracted by a slot 25 micrometers wide and the diffraction pattern is analyzed. It moves according to the gradient of the concentration. By analyzing the pattern movements one can get information on the phenomena occurring inside the solution. A near discontinuity in the concentration plot is always present at some distance from the growing crystal surface. This is the signal of an 'anomaly' in the concentration behavior. This method can be used to study crystal growth in microgravity. ESA

A THERMAL TYPE PROBE FOR LOW VELOCITY MEASUREMENTS **c19**
L. Gorbunov and V. Kolevzon *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 339-340 (For primary document see N93-24336 08-12)
Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The problem of low velocity measurements in experiments on free and forced convective flows is considered. For solving this problem the velocity probe is proposed. The principle of its operation is based on temperature monitoring of two metal joints heated electrically. The probe can work either in regime of constant temperature loading or in time dependent regime which is called 'thermal shock'. The dependance of Nusselt number from Peclet number refered to the first regime is most likely to the thermoanemometer one. The unsteady regime is determined by dependance of characteristic time versus the Reynolds number. Both of these regimes may be used for velocity measurements. ESA

Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 341-346 (For primary document see N93-24336 08-12)
Copyright Avail: CASI HC A02/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

A testbed experiment is presented which explores the effect of telescience utilization in an experiment to test changes in work efficency under severe conditions. These severe conditions are provided through the hydrobaric and hypoxic environments of a decompression chamber. A psychological examination was performed using the Kraeplin test and scoring on a television game. The Continent Negative Variation (CNV) and alpha blocking activation at low atmospheric pressure was also examined. The last one was a variation of heart rate during exercise in such low pressure. Timelining of these experiments was optimized to reduce the total elapsed time. Two principal investigators share time and two operators who were subjects of the experiments at the same time. Response of CNV was preprocessed onboard to compress raw data for downlink. Performance to play a TV game and to conduct arithmetic calculation of the Kraepelin, test was investigated to evaluate the thinking power of the operators during the experiment run. It was learned that flexible management on timeline and crew care enhances scientific achievements in a great amount at the telescience situation. ESA

The Anthrorack Lower Body Negative Pressure Device (LBNPD) and multiple non invasive measurement devices are presented. These can be used for cardiovascular research, diagnostics, and training in space and on ground. The LBNPD can be operated as a standalone instrument. Computer operation provides, however, more flexibility. In both cases, safety measures prevent the overstraining of the test subjects. Early detection and prevention of cardiovascular degradation is a main commitment of health care in space and on ground. It ethically requires non invasive diagnosis. Combination of noninvasive methods with the LBNP stress yields a valid scenario. On line analysis of non invasively obtained biosignals must rely, due to the large amount of produced data, on a powerful signal

analysis and validation system. The main component of such a scenario could be a multiprocessor computer system that efficiently reduces the data amount while increasing the medical information content. ESA

A BODY MASS MEASUREMENT DEVICE BASED ON THE OSCILLATION PRINCIPLE **c52**

J. F. F. Klinkhamer and F. Brechignac (European Space Agency. European Space Research and Technology Center, ESTEC, Noordwijk, Netherlands.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 353-357 (For primary document see N93-24336 08-12)

Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The study and development of a Body Mass Measurement Device (BMD) whose technical objectives aim at a repeatability of measurement better than +/- 100 grams with a compact instrument easy to operate, are reported. Assessment of the error sources by analysis and simulations resulted in the selection of the oscillation principle as the most promising concept to fulfill the requirements. Based on this choice, a breadboard was constructed which includes a parallel leaf spring mechanism combining two functions: spring elasticity and parallel guiding. With the further provision of a test set up designed to simulate microgravity in two horizontal dimensions, an experimental program was undertaken in order to gain a better understanding of the various error contributions, and to derive countermeasures for further improvement. The results presented strongly suggest that a body posture more compressed than the standing one will yield better performance; further meeting the requirements. ESA

The CEBAS (Closed Equilibrated Biological Aquatic System) Aquarack project, including its scientific frame program is primarily dedicated to basic research to study the influence of space conditions on aquatic animals and plants in long term multigeneration experiments. It also represents an extensively self maintaining closed artificial aquatic ecosystem for fish and higher water plants or microalgae and may have potential application for producing food in space. CEBAS is already operative in two versions of laboratory models in the frame of an international basic research program. It is a German option for the Columbus space station. CEBAS consists of a zoological component (animal tank including water recycling system), a botanical component (higher water plant compartment of microalgal bioreactor) and an electronical component (process control system). The basic concept and the organization of the scientific frame program are explained and latest examples of results of the current zoological research with special respect to reproductive biology are presented. The problems of intensive aquaculture systems, especially combined ones, disposed for the utilization in lunar or planetary bases are discussed. ESA

JAPANESE TREEFROG EXPERIMENT ONBOARD THE SPACE STATION MIR **c51**

Masamichi Yamashita and Akemi Izumi-Kurotani *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 365-369 (For primary document see N93-24336 08-12)

Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

An experiment investigating the postures and behavior of Japanese treefrogs Hyala japonica during 8 days on the Mir Space Station is presented. The frogs floated in a free volume with four legs stretched and body bent backward. Some of behaviors shown by the frogs are never or rarely observed on ground. Many of the frogs bent their neck severely backward when they perched in a surface, and walked backward some time. Degree of adaptation to space environment, in terms of behaviors, was evaluated by repeating the experiment on a different day. Number of failure at landing on a surface from free floating in a space was found to decrease at the later day in orbit. Readaptation process were analyzed at their recovery to ground. Changes of bone, muscle, inner ear, and hormones were investigated in the recovered frogs. ESA

GRAVITY AND ROOT MORPHOGENESIS **c51**

G. Perbal and D. Driss-Ecole *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 371-377 Sponsored by CNES (For primary document see N93-24336 08-12)

Copyright Avail: CASI HC A02/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Results of experiments to investigate the effects of gravity on root morphogenesis are presented and discussed. When a seedling root is placed in the horizontal position its extremity bends in order to recover its initial orientation with respect to gravity. The curvature is due to a differential growth in the lower and upper sides of this organ. In microgravity, cell elongation occurred closer to the root meristem than in the 1 G centrifuge and the mitotic index was greater. In microgravity, a relaxation of the cytoskeleton of statocytes was also observed. It is proposed that on the ground minuscule forces are exerted by the statoliths on the periphery of the statocytes and that these forces lead to a symmetrical signal responsible for straight growth. When the root is placed in the horizontal position, on the contrary, the pressure of the statoliths creates an asymmetrical message which provokes the gravitropic curvature. ESA

DEVELOPMENT OF ARABIDOPSIS THALIANA GROWN UNDER MICROGRAVITY CONDITIONS **c51**

L. G. Briarty and E. P. Maher (Open Univ., Scotland.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 379-384 Sponsored by United Kingdom Science and Engineering Research Council and Nottingham Univ. National Westminster Bank Research Fund (For primary document see N93-24336 08-12)

Copyright Avail: CASI HC A02/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

An experiment to determine the effects of microgravity conditions on the early growth of Ariabidopsis thaliana wild-type and aux-1 mutant seedlings was developed and flown in the biorack on the IML-1 mission of Spacelab in January 1992. The experiment was carried out successfully and seedlings fixed at four stages of germination were returned to Earth; early analysis shows little difference in growth rates in microgravity and 1 G of the roots and hypocotyls of the plants, though hypocotyl hook formation appears altered in microgravity. Further studies of cell and tissue structure in the various plant organs are under way. ESA

EXOBIOLOGY AND TERRESTRIAL LIFE **c55**

Andre Brack *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 387-391 (For primary document see N93-24336 08-12)

Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Terrestrial life can be schematically described as organic molecules organized in liquid water. According to Oparin's hypothesis, organic building blocks required for early life were produced from simple organic molecules formed in a primitive reducing atmosphere. Some precursors of biomolecules

have been obtained in the laboratory. Geochemists favor now a less reducing atmosphere dominated by carboin dioxide. In such an atmosphere, very few building blocks are formed. Import of extraterrestrial organic molecules may represent an alternative supply. Experimental support for such an alternative scenario is examined in comets, meteorites and micrometeorites. In contrast to the classical scenario, a chemoautotrophic origin of life is discussed. Finally, interesting information related to early terrestrial life may be gained from Mars exploration. ESA

ECOSYSTEMS ON EARTH AND IN SPACE (THE POSSIBLE UTILIZATION OF ARTIFICIAL ECOSYSTEMS FOR SPACE LIFE SUPPORT SYSTEMS) **c54**
V. Bluem *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories Jul. 1992 p 393-398 (For primary document see N93-24336 08-12)
Copyright Avail: CASI HC A02/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The possibilities and constraints of the utilization of biogenerative systems for space life support systems are discussed and examples of past and current scientific activities in this field are demonstrated. On Earth organism are influenced by two types of environmental factors: abiotic (e.g., temperature, medium salinity) and biotic ones (e.g., food, predators). During evolution organisms had to avoid or to adapt to given or changing factors and they are linked in different levels into regenerative cycles for oxygen, nitrogen and water which guarantee the maintenance of life together with the essential solar energy. In space the environmental factors are lethal for living beings and for spaceflight life support systems are an essential precondition. Until today these are 'alimentary', i.e., all food, water and oxygen has to be brought into and the wastes have to be removed form the protective environment. ESA

APPARATUS FOR SIMULATING AN EXOATMOSPHERIC STRUCTURE Patent Application
Robert Lynn Harvey, inventor (to NASA) 17 Feb. 1993 40 p
(NASA-Case-MSC-21975-1; NAS 1.71:MSC-21975-1;
US-Patent-Appl-SN-018844) Avail: CASI HC A03/MF A01

Apparatus for simulating an exoatmospheric structure, such as a spin stabilized satellite, in an environment subject to gravitational forces is presented. The apparatus includes a floating structure which is pivotally and rotationally supported upon a gimballed bearing structure positioned adjacent to the center of mass of the floating structure and suspended upon a support structure. The floating structure is translatable in either vertical direction relative to the supporting structure upon a vertically movable suspension system connected to the supporting structure. The supporting structure is provided with bearing assemblies which are adapted to engage a supporting surface for permitting freedom of movement of the supporting structure over the supporting structure in any direction. ADVANCED UNDERWATER LIFT DEVICE
David T. Flanagan and Robert C. Hopkins (Houston Univ., Clear Lake, TX.) Mar. 1993 52 p Sponsored by NASA. Lyndon B. Johnson Space Center
(NASA-CR-185709; NAS 1.26:185709) Avail: CASI HC A04/MF A01

Flexible underwater lift devices ('lift bags') are used in underwater operations to provide buoyancy to submerged objects. Commercially available designs are heavy, bulky, and awkward to handle, and thus are limited in size and useful lifting capacity. An underwater lift device having less than 20 percent of the bulk and less than 10 percent of the weight of commercially available models was developed. The design features a dual membrane envelope, a nearly homogeneous envelope membrane stress distribution, and a minimum surface-to-volume ratio. A proof-of-concept model of 50 kg capacity was built and tested. Originally designed to provide buoyancy to mock-ups submerged in NASA's weightlessness simulators, the device may have application to water-landed spacecraft which must deploy flotation upon impact, and where launch weight and volume penalties are significant. The device may also be useful for the automated recovery of ocean floor probes or in marine salvage applications. Author (revised)

SUSPENSION DEVICE FOR LOW-FREQUENCY STRUCTURES Patent
Meng-Sang Chew, inventor (to NASA), Jer-Nan Juang, inventor (to NASA), and Li-Farn Yang, inventor (to NASA) 4 May 1993 9 p Filed 28 Mar. 1991 supersedes N91-28184 (29 - 20, p 3289)
(NASA-Case-LAR-14272-1-CU; US-Patent-5,207,110;
US-Patent-Appl-SN-678553; US-Patent-Class-73-866.4;
US-Patent-Class-73-865.6; US-Patent-Class-248-328;
US-Patent-Class-434-34; Int-Patent-Class-B64G-7/00) Avail: US Patent and Trademark Office

A suspension device is provided for simulating the free-free boundary conditions of space for a low frequency structure. A support cable is connected at one end to the test structure and is vertically guided by a guiding ring. The other end of the cable is connected to a cam having an outer circumference which supports the cable. A drive axle passes through the cam center of rotation and is rotatably journalled in a suitable manner to a rigid structure. Two torsion springs are provided about the drive axle. One end of each spring is connected to a respective face of the cam and the other end is connected to the fixed support. The cam is shaped and the torsion springs selected such that Wr(sub (t)) = T(sub s(t)), wherein W is the weight of the test structure; r(sub (t)) is the instantaneous moment arm defined as the perpendicular distance from the rotational center of the cam to the cable at time t, and T(sub s(t)) is the total spring torque exerted by the two springs on the cam at time t. The test structure is accordingly vertically suspended by the cable and the instantaneous moment arm compensates for any increased spring torque arising from a vertical displacement of the test structure to simulate space conditions.

ROBUST NEIGHBORING OPTIMAL GUIDANCE FOR THE ADVANCED LAUNCH SYSTEM
David G. Hull Jan. 1993 34 p
(Grant NAG1-944)
(NASA-CR-192087; NAS 1.26:192087) Avail: CASI HC A03/MF A01

In recent years, optimization has become an engineering tool through the availability of numerous successful nonlinear programming codes. Optimal control problems are converted into parameter optimization (nonlinear programming) problems by assuming the control to be piecewise linear, making the unknowns the nodes or junction points of the linear control segments. Once the optimal piecewise linear control (suboptimal) control is known, a guidance law for operating near the suboptimal path is the neighboring optimal piecewise linear control (neighboring suboptimal control). Research conducted under this grant has been directed toward the investigation of neighboring suboptimal control as a guidance scheme for an advanced launch system. For individual titles, see N93-22010 through N93-22011.

ADVANCED LAUNCH SYSTEM TRAJECTORY OPTIMIZATION USING SUBOPTIMAL CONTROL
Douglas A. Shaver and David G. Hull *In its* Robust Neighboring Optimal Guidance for the Advanced Launch System Jan. 1993 10 p (For primary document see N93-22009 08-15)
Avail: CASI HC A02/MF A01

The maximum-final mass trajectory of a proposed configuration of the Advanced Launch System is presented. A model for the two-stage rocket is given; the optimal control problem is formulated as a parameter optimization problem; and the optimal trajectory is computed using a nonlinear programming code called VF02AD. Numerical results are presented for the controls (angle of attack and velocity roll angle) and the states. After the initial rotation, the angle of attack goes to a positive value to keep the trajectory as high as possible, returns to near zero to pass through the transonic regime and satisfy the dynamic pressure constraint, returns to a positive value to keep the trajectory high and to take advantage of minimum drag at positive angle of attack due to aerodynamic shading of the booster, and then rolls off to negative values to satisfy the constraints. Because the engines cannot be throttled, the maximum dynamic pressure occurs at a single point; there is no maximum dynamic pressure subarc. To test approximations for obtaining analytical solutions for guidance, two additional optimal trajectories are computed: one using untrimmed aerodynamics and one using no atmospheric effects except for the dynamic pressure constraint. It is concluded that untrimmed aerodynamics has a negligible effect on the optimal trajectory and that approximate optimal controls should be able to be obtained by treating atmospheric effects as perturbations. NEIGHBORING SUBOPTIMAL CONTROL FOR VEHICLE GUIDANCE
David G. Hull and Michael J. Nowak *In its* Robust Neighboring Optimal Guidance for the Advanced Launch System Jan. 1993 11 p (For primary document see N93-22009 08-15)
Avail: CASI HC A03/MF A01

The neighboring optimal feedback control law is developed for systems with a piecewise linear control for the case where the optimal control is obtained by nonlinear programming techniques. To develop the control perturbation for a given deviation from the nominal path, the second variation is minimized subject to the constraint that the final conditions be satisfied (neighboring suboptimal control). This process leads to a feedback relationship between the control perturbation and the measured deviation from the nominal state. Neighboring suboptimal control is applied to the lunar launch problem. Two approaches, single optimization and multiple optimization for calculating the gains are used, and the gains are tested in a guidance simulation with a mismatch in the acceleration of gravity. Both approaches give acceptable results, but multiple optimization keeps the perturbed path closer to the nominal path. Author

FUTURE OF THE US SPACE LAUNCH CAPABILITY: A TASK GROUP REPORT
Nov. 1992 50 p
(PB93-139947) Avail: CASI HC A03/MF A01

In July 1992, a special task group of the Space Policy Advisory Board reviewed the nation's Space Launch Strategy approved by the President in July 1991. The report contains the findings and recommendations of the Task Group. The Task Group has provided a set of recommendations from a 'national' perspective that will improve our nation's space launch capability, make us more competitive in the international marketplace, and reduce the cost of government space launch operations. The U.S. should start a single, completely new, 'Spacelifter' space launch vehicle program. The Spacelifter program would focus on the medium performance range, but be 'modular' in its performance capability. The task group also recommends a transition plan to phase out the older and expensive space launch vehicles, including the Space Shuttle. The task group further recommends that a centralized management structure be established to oversee Spacelifter and other space launch activities. Derived from text

As longer projectiles are accelerated, the efficiency (projectile mass/launch mass) of the launch package decreases. The reduction in efficiency makes launching projectiles with a L/D (length-to-diameter ratio) greater than 20 undesirable. EM guns have several launch characteristics that differ from conventional guns. Higher launch velocities are achievable in EM guns because sonic gas velocities do not limit the projectile velocity. Acceleration profiles for EM guns are more constant. The acceleration forces can be distributed on the projectile easily because the accelerating force can be distributed with multiple armatures. These characteristics combine to make EN guns a very attractive approach for launching very long (i.e.. high L/D ratio) projectiles. Railgun launchers with multiple armatures can distribute the accelerating force. Each armature is supplied gun current for acceleration through its own set of rails. This multi-rail, multi-armature concept was tested at the railgun test facility. The results demonstrated feasibility. We were able to control current distribution to multiple armatures. This paper describes the theory and test results for multi-armature launch of high L/D projectiles. GRA

ELECTRON-BEAM ROCKET ACCELERATION OF HYDROGEN PELLETS

C. C. Tsai, C. A. Foster, S. L. Milora, D. E. Schechter, and J. H. Whealton 1992 20 p Presented at the 39th National Symposium of the American Vacuum Society, Chicago, IL, 9-13 Nov. 1992
(Contract DE-AC05-84OR-21400)
(DE93-002822; CONF-921129-2) Avail: CASI HC A03/MF A01

A proof-of-principle device for characterizing electron-beam rocket pellet acceleration has been developed and operated during the last few years. Experimental data have been collected for thousands of accelerated hydrogen pellets under a variety of beam conditions. One intact hydrogen pellet was accelerated to a speed of 578 m/s by an electron beam of 10 kV, 0.8 A, and 1 ms. The collected data reveal the significant finding that the measured burn velocity of bare hydrogen pellets increases with the square of the beam voltage in a way that is qualitatively consistent with the theoretical prediction based on the neutral gas shielding (NGS) model. The measured burn velocity increases with the beam current or power and then saturates at values two to three times greater than that predicted by the NGS model. The discrepancy may result from low pellet strength and large beam-pellet interaction areas. Moreover, this feature may be the cause of the low measured exhaust velocity, which often exceeds the sonic velocity of the ablated gas. Consistent with the NGS model, the measured exhaust velocity increases in direct proportion to the beam current and in inverse proportion to the beam voltage. To alleviate the pellet strength problem, experiments have been performed with the hydrogen ice contained in a lightweight rocket casing or shell. Pellets in such sabots have the potential to withstand higher beam powers and achieve higher thrust-coupling efficiency. Some experimental results are reported and ways of accelerating pellets to higher velocity are discussed. DOE

SPIRIT 2 VEHICLE: (A26.780). POST FLIGHT REPORT Final Report, 21 Dec. 1988 - 28 Mar. 1992
C. P. Chalfant 26 May 1992 28 p
(Contract F19628-89-C-0028)
(AD-A259991; PL-TR-92-2175; AD-E201341) Avail: CASI HC A03/MF A01

The Spirit 2 Launch Vehicle System was launched successfully from Poker Flat Research Range on 28 Mar. 1992. All flight objectives were achieved, and a peak altitude of 326 km was achieved. The vehicle liftoff weight was 20,092 pounds. The first stage, powered by the Talos motor, boosted the vehicle to an altitude of 6000 feet. The first stage experienced minor wind disturbances. The second stage, an Aries motor (a surplus solid propellant motor from the Minuteman 1 missile), performed as predicted. The inertial guidance system achieved the pre-programmed burnout conditions. The spent second stage impacted 157 km uprange. GRA

The National Launch System provides an opportunity to realize the potential of Al-Li. Advanced structures can reduce weights by 5-40 percent as well as relax propulsion system performance specifications and reduce requirements for labor and materials. The effect on costs will be substantial. Advanced assembly and process control technologies also offer the potential for greatly reduced labor during the manufacturing and inspection processes. Current practices are very labor-intensive and, as a result, labor costs far outweigh material costs for operational space transportation systems. The technological readiness of new structural materials depends on their commercial availability, producibility and materials properties. Martin Marietta is vigorously pursuing the development of its Weldalite 049 Al-Li alloys in each of these areas. Martin Marietta is also preparing to test an automated work cell concept that it has developed using discrete event simulation. CASI

ADVANCED MANNED LAUNCH SYSTEM
Theodore A. Talay *In its* Space Transportation Materials and Structures Technology Workshop. Volume 2: Proceedings Feb. 1993 p 27-38 (For primary document see N93-22081 08-16)
Avail: CASI HC A03/MF A04

Several alternatives exist for the development of the next manned launch system. The Advanced Manned Launch System (AMLS), which represents a clean-sheet replacement for the Space Shuttle, faces

competition from concepts such as (1) the Personnel Launch System, which would serve as a personnel transport to complement the Space Shuttle, and (2) an advanced version of the existing Space Shuttle. An AMLS system could begin operations sometime between 2005 and 2020, depending upon the level of national interest and support. It would probably demonstrate a payload capacity less than that of the Space Shuttle, although performance specifications are far from certain. Even the form of the AMLS is still under discussion. Design studies have considered a wide variety of options including all levels of hardware reusability; single-, dual- and multiple-staging; and airbreathing vs. rocket propulsion. An evaluation of the relative cost-effectiveness of these options is impossible without guidance regarding basic mission requirements such as total number of launches over the system's life cycle and the date required. The availability of more advanced technologies will enable single-stage-to-orbit (SSTO) designs that are in general not feasible using current technology. Author

ADVANCED CREW RESCUE VEHICLE/PERSONNEL LAUNCH SYSTEM

Jerry W. Craig *In* NASA. Langley Research Center, Space Transportation Materials and Structures Technology Workshop. Volume 2: Proceedings Feb. 1993 p 39-6 (For primary document see N93-22081 08-16)

Avail: CASI HC A03/MF A04

The Advanced Crew Rescue Vehicle (ACRV) will be an essential element of the Space Station to respond to three specific missions, all of which have occurred during the history space exploration by the U.S. and the Soviets: (1) Mission DRM-1: Return of disabled crew members during medical emergencies; (2) Mission DRM-2: Return of crew members from accidents or as a result of failures of Space Station systems; and (3) Mission DRM-3: Return of crew members during interruption of Space Shuttle launches. The ACRV will have the ability to transport up to eight astronauts during a 24-hour mission. Not only would the ACRV serve as a lifeboat to provide transportation back to Earth, but it would also be available as a immediately available safe refuge in case the Space Station were severely damaged by space debris or other catastrophe. Upon return to Earth, existing world-wide search and rescue assets operated by the Coast Guard and Department of Defense would be able to retrieve personnel returned to Earth via the ACRV. The operational approach proposed for the ACRV is tailored to satisfying mission requirements for simplicity of operation (no piloting skills or specially trained personnel are required), continuous availability, high reliability and affordability. By using proven systems as the basis for many critical ACRV systems, the ACRV program is more likely to achieve each of these mission requirements. Nonetheless, the need for the ACRV to operate reliably with little preflight preparation after, perhaps, 5 to 10 years in orbit imposes challenges not faced by any previous space system of this complexity. Specific concerns exist regarding micrometeoroid impacts, battery life, and degradation of recovery parachutes while in storage. Author

SINGLE STAGE TO ORBIT/SDIO

James R. French (JRF Engineering Services, La Canada, CA.) *In* NASA. Langley Research Center, Space Transportation Materials and Structures Technology Workshop. Volume 2: Proceedings Feb. 1993 p 66-7 (For primary document see N93-22081 08-16)

Avail: CASI HC A02/MF A04

This paper included a discussion of the United States' need for a launch system that demonstrates both high capacity and low cost. Current systems, which typically require two years' lead time to provide on-orbit service to space platforms, are too inflexible for many missions. A system is needed that is able to operate in much the same way as existing commercial aircraft. The SSTO program is focused on satisfying aircraft-like operations and logistics support requirements such as engine-out intact abort capability and seven-day, 350-man-day vehicle turnaround times. Author

LUNAR TRANSFER VEHICLE STUDIES

Joseph T. Keeley *In* NASA. Langley Research Center, Space Transportation Materials and Structures Technology Workshop. Volume 2: Proceedings Feb. 1993 p 77-9 (For primary document see N93-22081 08-16)

Avail: CASI HC A03/MF A04

Lunar transportation architectures exist for several different mission scenarios. Direct flights from Earth are possible, as the Apollo program clearly demonstrated. Alternatively, a space transfer vehicle could be constructed in space by using the Space Station as a base of operations, or multiple vehicles could be launched from Earth and dock in LEO without using a space station for support. Similarly, returning personnel could proceed directly to Earth or rendezvous at the Space Station for a ride back home on the Space Shuttle. Multiple design concepts exist which are compatible with these scenarios and which can support requirements of cargo, personnel, and mission objectives. Regardless of the ultimate mission selected, some technologies will certainly play a key role in the design and operation of advanced lunar transfer vehicles. Current technologies are capable of delivering astronauts to the lunar surface, but improvements are needed to affordably transfer the material and equipment that will be needed for establishing a lunar base. Materials and structures advances, in particular, will enable the development of more capable cryogenic fluid management and propulsion systems, improved structures, and more efficient vehicle assembly, servicing and processing. Author

MARS TRANSFER VEHICLE STUDIES

Gordon Woodcock *In* NASA. Langley Research Center, Space Transportation Materials and Structures Technology Workshop. Volume 2: Proceedings Feb. 1993 p 93-104 (For primary document see N93-22081 08-16)

Avail: CASI HC A03/MF A04

Earth-to-Mars distances vary from 60 to 400 million kilometers over a 14-year cycle. This complicates Mars mission design as a function of calendar time. Stay times at Mars are also strongly driven by opportunities for a return flight path which are within the limits of delta-V associated with practical space vehicles. The biggest difference between Mars and lunar transfer missions is mission time, which grows from a few days for the moon, to as much as a few hundred days for Mars missions. As a result, modules for similarly sized crews must be much larger for Mars missions that for transfer to lunar orbit. Technology challenges for one Mars mission scenario analyzed by Boeing include aerobrakes, propulsion, and life support systems. Mission performance is very sensitive to aerobrake weight fraction and, as a result, there is an incentive to use high performance materials such as advanced composites and thermal protection systems. Lander aerobrake would be used twice (for both planetary capture and descent to the Mars surface), and it would need to survive temperatures up to 3500 degrees. Author

AEROBRAKING TECHNOLOGY STUDIES

Charles H. Eldred *In its* Space Transportation Materials and Structures Technology Workshop. Volume 2: Proceedings Feb. 1993 p 105-117 (For primary document see N93-22081 08-16)

Avail: CASI HC A03/MF A04

For a Mars Expedition, aerobrakes can play a vital role in several major mission events, including aerocapture to achieve orbit and descent to the planetary surface both at Mars and upon return to Earth. The feasibility of aerobrake designs will depend upon material and structures technologies because they will serve as a key factor in determining: (1) aerobrake mass and mass fraction; (2) the extent to which aerobrakes can survive the thermal environment. This is especially important for reusable aerobrakes. With the cancellation of the Aeroassist Flight Experiment, the effort to validate aerobrake designs has focused on laboratory test and analysis; (3) the feasibility of assembling and/or deploying large aerobrakes. On-orbit assembly is a critical issue for all spacecraft intended for Mars exploration missions. Current studies are addressing options related to inspace assembly and construction; and (4) configuration lift-to-drag (L/D) ratio. High L/D increases convective heating, whereas low L/D emphasizes radiative heating. In general, the lowest L/D design that can satisfy mission requirements is preferred. Author

NASA supports a vigorous Earth-to-orbit (ETO) research and technology program as part of its Civil Space Technology Initiative. The purpose of this program is to provide an up-to-date technology base to support future space transportation needs for a new generation of lower cost, operationally efficient, long-lived and highly reliable ETO propulsion systems by enhancing the knowledge, understanding and design methodology applicable to advanced oxygen/hydrogen and oxygen/hydrocarbon ETO propulsion systems. Program areas of interest include analytical models, advanced component technology, instrumentation, and validation/verification testing. Organizationally, the program is divided between technology acquisition and technology verification as follows: (1) technology acquisition; and (2) technology verification. Author

Existing NASA research contracts are supporting development of advanced reinforced polymer and metal matrix composites for use in liquid rocket engines of the future. Advanced rocket propulsion concepts, such as modular platelet engines, dual-fuel dual-expander engines, and variable mixture ratio engines, require advanced materials and structures to reduce overall vehicle weight as well as address specific propulsion system problems related to elevated operating temperatures, new engine components, and unique operating processes. High performance propulsion systems with improved manufacturability and maintainability are needed for single stage to orbit vehicles and other high performance mission applications. One way to satisfy these needs is to develop a small engine which can be clustered in modules to provide required levels of total thrust. This approach should reduce development schedule and cost requirements by lowering hardware lead times and permitting the use of existing test facilities. Modular engines should also reduce operational costs associated with maintenance and parts inventories. Author

SPACE PROPULSION **c20**
John M. Kazaroff *In* NASA. Langley Research Center, Space Transportation Materials and Structures Technology Workshop. Volume 2: Proceedings Feb. 1993 p 138-142 (For primary document see N93-22081 08-16)
Avail: CASI HC A01/MF A04

Lewis Research Center is developing broad-based new technologies for space chemical engines to satisfy long-term needs of ETO launch vehicles and other vehicles operating in and beyond Earth orbit. Specific objectives are focused on high performance LO2/LH2 engines providing moderate thrusts of 7,5-200 klb. This effort encompasses research related to design analysis and manufacturing processes needed to apply advanced materials to subcomponents, components, and subsystems of space-based systems and related ground-support equipment. High-performance space-based chemical engines face a number of technical challenges. Liquid hydrogen turbopump impellers are often so large that they cannot be machined from a single piece, yet high stress at the vane/shroud interface makes bonding extremely difficult. Tolerances on fillets are critical on large impellers. Advanced materials and fabricating techniques are needed to address these and other issues of interest. Turbopump bearings are needed which can provide reliable, long life operation at high speed and high load with low friction losses. Hydrostatic bearings provide good performance, but transients during pump starts and stops may be an issue because no pressurized fluid is available unless a separate bearing pressurization system is included. Durable materials and/or coatings are needed that can demonstrate low wear in the harsh LO2/LH2 environment. Advanced materials are also needed to improve the lifetime, reliability and performance of other propulsion system elements such as seals and chambers. Author

Nuclear thermal and nuclear electric propulsion systems will enable and/or enhance important space exploration missions to the moon and Mars. Current efforts are addressing certain research areas, although NASA and DOE still have much work yet to do. Relative to chemical systems, nuclear thermal propulsion offers the potential of reduced vehicle weight, wider launch windows. and shorter transit times, even without aerobrakes. This would improve crew safety by reducing their exposure to cosmic radiation. Advanced materials and structures will be an important resource in responding to the challenges posed by safety and test facility requirements, environmental concerns, high temperature fuels and the high radiation, hot hydrogen environment within nuclear thermal propulsion systems. Nuclear electric propulsion (NEP) has its own distinct set of advantages relative to chemical systems. These include low resupply mass, the availability of large amounts of onboard electric power for other uses besides propulsion, improved launch windows, and the ability to share technology with surface power systems. Development efforts for NEP reactors will emphasize long life operation of compact designs. This will require designs that provide high fuel burnup and high temperature operation along with personnel and environmental safety. Author

SOLID ROCKET MOTORS **c20**
Ronn L. Carpenter *In* NASA. Langley Research Center, Space Transportation Materials and Structures Technology Workshop. Volume 2: Proceedings Feb. 1993 p 148-164 (For primary document see N93-22081 08-16)
Avail: CASI HC A03/MF A04

Structural requirements, materials and, especially, processing are critical issues that will pace the introduction of new types of solid rocket motors. Designers must recognize and understand the drivers associated with each of the following considerations: (1) cost; (2) energy density; (3) long term storage with use on demand; (4) reliability; (5) safety of processing and handling; (6) operability; and (7) environmental acceptance.

A recent article in Aerospace America claims that 'the average success ratio of the current U.S. stable of launch vehicles, including upper stages, is about 92 percent (without upper stages it is close to 95 percent). The 8 percent failure probability implies an expected loss of $12M per flight, not including the lost opportunity costs'. Since payload costs are likely to be much greater than launch costs and even more so for the new launch vehicles for the Advanced Launch Development Program (ALDP), the cost of rocket motor unreliability at the current 8 percent rate can run into billions of dollars if expected increases in demand are realized. At an 8 percent failure rate, it is extremely unlikely that failure will occur during the first few ground tests of a new system. At that time, most of the design, analysis and tooling costs of the program have not expended. Since most systems are expected to be used ten to a hundred or more times, the likelihood of one or more failures is very large, and it can be expected that the above losses will be realized in the future. This will occur unless the problems are addressed and remedied. Recent trends suggest the problem is not being addressed adequately. Author

It is the teams view that there is a general lack of awareness of orbiter tile susceptibility to damage by debris - the same applies to the care and critical nature of the shuttle elements and operations process so necessary to minimizing damaging debris - it is essential that all involved employees, both government and contractor, understand that minuscule loose objects or materials coming off the elements will most likely cause some tile damage at the speed encountered during ascent. It is recommended that descriptive material, photos, video tape, debris samples and other appropriate matter be assembled and provided to the proper organizations for dissemination to their employees - it should emphasize that the tiles perform outstanding in their debris-free design environment; but, are extremely sensitive to small particle damage. SPACE TRANSFER CONCEPTS AND ANALYSIS FOR EXPLORATION MISSIONS. IMPLEMENTATION PLAN AND ELEMENT DESCRIPTION DOCUMENT. VOLUME 1: MAJOR TRADES. BOOK 1: DRAFT FINAL
15 Feb. 1991 369 p
(Contract NAS8-37857)
(NASA-CR-192488; NAS 1.26:192488; D615-10026-1-Vol-1) Avail: CASI HC A16/MF A03

This document presents trade studies and reference concept designs accomplished during a study of Space Transfer Concepts and Analyses for Exploration Missions (STCAEM). This volume contains the major top level trades, level 2 trades conducted in support of NASA's Lunar/Mars Exploration Program Office, and a synopsis of the vehicles for different propulsion systems under trade consideration. The vehicles are presented in more detail in other volumes of this report. Book 1 of Volume 1 covers the following analyses: lunar/Mars commonality trades, lunar/Mars mission operations, and Mars transfer systems. Author

TRANSPORTATION SYSTEMS ANALYSES, VOLUME 2 Semiannual Report, 10 May - 30 Oct. 1992
6 Nov. 1992 90 p
(Contract NAS8-39209)
(NASA-CR-192486; NAS 1.26:192486) Avail: CASI HC A05/MF A01

The principal objective is to accomplish a systems engineering assessment of the nation's space transportation infrastructure. This analysis addresses the necessary elements to perform man delivery and return, cargo transfer, cargo delivery, payload servicing, and the exploration of the Moon and Mars. Specific elements analyzed, but not limited to, include the Space Exploration Initiative (SEI), the National Launch System (NLS), the current expendable launch vehicle (ELV) fleet, ground facilities, the Space

Station Freedom (SSF), and other civil, military, and commercial payloads. The performance entails maintaining a broad perspective on the large number of transportation elements that could potentially comprise the U.S. space infrastructure over the next several decades. To perform this systems evaluation, top-level trade studies are conducted to enhance our understanding of the relationships between elements of the infrastructure. This broad 'infrastructure-level perspective' permits the identification of preferred infrastructures. Sensitivity analyses are performed to assure the credibility and usefulness of study results. Conceptual studies of transportation elements contribute to the systems approach by identifying elements (such as ETO node and transfer/excursion vehicles) needed in current and planned transportation systems. These studies are also a mechanism to integrate the results of relevant parallel studies.

DEBRIS/ICE/TPS ASSESSMENT AND INTEGRATED PHOTOGRAPHIC ANALYSIS FOR SHUTTLE MISSION STS-54 Final Report, 12-21 Jan. 1993

Gregory N. Katnik, Scott A. Higginbotham, and J. Bradley Davis Mar. 1993 146 p Original contains color illustrations

(NASA-TM-107558; NAS 1.15:107558) Avail: CASI HC A07/MF A02; 63 functional color pages

A Debris/Ice/TPS assessment and integrated photographic analysis was conducted for Shuttle Mission STS-54. Debris inspections of the flight elements and launch pad were performed before and after launch. Ice/frost conditions on the External Tank were assessed by the use of computer programs, nomographs, and infrared scanner data during cryogenic loading of the vehicle followed by on-pad visual inspection. High speed photography was analyzed after launch to identify ice/debris sources and evaluate potential vehicle damage and/or in-flight anomalies. This report documents the debris/ice/TPS conditions and integrated photographic analysis of Shuttle Mission STS-54, and the resulting effect on the Space Shuttle Program.

TASK ANALYSIS OF SHUTTLE ENTRY AND LANDING ACTIVITIES

Albert W. Holland and Stephen T. VanderArk (Krug Life Sciences, Inc., Houston, TX.) Mar. 1993 50 p

(NASA-TM-104761; S-710; NAS 1.15:104761) Avail: CASI HC A03/MF A01

The Task Analysis of Shuttle Entry and Landing (E/L) Activities documents all tasks required to land the Orbiter following an STS mission. In addition to analysis of tasks performed, task conditions are described, including estimated time for completion, altitude, relative velocity, normal and lateral acceleration, location of controls operated or monitored, and level of g's experienced. This analysis precedes further investigations into potential effects of zero g on piloting capabilities for landing the Orbiter following long-duration missions. This includes, but is not limited to, researching the effects of extended duration missions on piloting capabilities. Four primary constraints of the analysis must be clarified: (1) the analysis depicts E/L in a static manner--the actual process is dynamic; (2) the task analysis was limited to a paper analysis, since it was not feasible to conduct research in the actual setting (i.e., observing or filming duration an actual E/L); (3) the tasks included are those required for E/L during nominal, daylight conditions; and (4) certain E/L tasks will vary according to the flying style of each commander.

SPACE TRANSFER CONCEPTS AND ANALYSIS FOR EXPLORATION MISSIONS Final Report, May - Sep. 1992

Gordon R. Woodcock Nov. 1992 179 p

(Contract NAS8-37857)

(NASA-CR-192482; NAS 1.26:192482; D615-10060) Avail: CASI HC A09/MF A02

The current technical effort is part of the third phase of a broad-scoped and systematic study of space transfer concepts for human lunar and Mars missions. The study addressed the technical issues relating to the First Lunar Outpost (FLO) habitation vehicle with emphasis on the structure, power, life support system, and radiation environment for a baseline habitat with specific alternatives for the baseline.

SPACE TRANSFER CONCEPTS AND ANALYSIS FOR EXPLORATION MISSIONS. IMPLEMENTATION PLAN AND ELEMENT DESCRIPTION DOCUMENT (DRAFT FINAL). VOLUME 3: NUCLEAR THERMAL ROCKET VEHICLE

8 Mar. 1991 450 p

(Contract NAS8-37857)

(NASA-CR-192491; NAS 1.26:192491; D615-10026-3-Vol-3) Avail: CASI HC A19/MF A04

This document presents the nuclear thermal rocket (NTR) concept design developed in support of the Space Transfer Concepts and Analysis for Exploration Missions (STCAEM) study. The evolution of the NTR concept is described along with the requirements, guidelines and assumptions for the design. Operating modes and options are defined and a systems description of the vehicle is presented. Artificial gravity configuration options and space and ground support systems are discussed. Finally, an implementation plan is presented which addresses technology needs, schedules, facilities and costs.

(Contract NAS8-37857)
(NASA-CR-192494; NAS 1.26:192494; D615-10026-6-Vol-6) Avail: CASI HC A13/MF A03

NASA's two Office of Space Flight (Code M) Space Transfer Vehicle (STV) contractors supported development of Space Exploration Initiative (SEI) lunar transportation concepts. This work treated lunar SEI missions as the far end of a more near-term STV program, most of whose missions were satellite delivery and servicing requirements derived from Civil Needs Data Base (CNDB) projections. Space Transfer Concepts and Analysis for Exploration Missions (STCAEM) began to address the complete design of a lunar transportation system. The following challenges were addressed: (1) the geometry of aerobraking; (2) accommodation of mixed payloads; (3) cryogenic propellant transfer in Low Lunar Orbit (LLO); (4) fully re-usable design; and (5) growth capability. The leveled requirements, derived requirements, and assumptions applied to the lunar transportation system design are discussed. The mission operations section includes data on mission analysis studies and performance parametrics as well as the operating modes and performance evaluations which include the STCAEM recommendations. Element descriptions for the lunar transportation family included are a listing of the lunar transfer vehicle/lunar excursion vehicle (LTV/LEV) components; trade studies and mass analyses of the transfer and excursion modules; advanced crew recovery vehicle (ACRV) (modified crew recovery vehicle (MCRV)) modifications required to fulfill lunar operations; the aerobrake shape and L/D to be used; and some costing methods and results. Commonality and evolution issues are also discussed. CASI

By congressional action in 1987, the National Aeronautics and Space Administration (NASA) was authorized to provide an opportunity for American school students to name the new Space Shuttle orbiter being built to replace the Challenger. The Council of Chief State School Officers (CCSSO), an education organization representing the chief education officials of the nation, was asked by NASA to assist in the development and administration of this exciting and important educational activity. A selection of interdisciplinary activities related to the Space Shuttle that were designed by students for the NASA Orbiter-Naming Program are presented. The national winner's project is first followed by other projects listed in alphabetical order by state, and a bibliography compiled from suggestions by the state-level winning teams. Author

A wind-tunnel investigation was performed to determine the aerodynamic characteristics of a proposed lifting-body personnel launch system (PLS) configuration over a Mach range of 0.05 to 20.3. The test configuration had a low-aspect-ratio body with a flat undersurface and three fins on the upper aft body. Data are presented with a minimum of analysis. All of the experimental data were placed in a structured data base using the R:BASE system and are included on two floppy disks enclosed in the back of this report. Author (revised)

As part of the RICIS project, the reinforcement learning techniques developed at Ames Research Center are being applied to proximity and docking operations using the Shuttle and Solar Maximum Mission (SMM) satellite simulation. In utilizing these fuzzy learning techniques, we use the Approximate Reasoning based Intelligent Control (ARIC) architecture, and so we use these two terms interchangeably to imply the same. This activity is carried out in the Software Technology Laboratory utilizing the Orbital Operations Simulator (OOS) and programming/testing support from other contractor personnel. This report is the final deliverable D4 in our milestones and project activity. It provides the test results for the special testcase of approach/docking scenario for the shuttle and SMM satellite. Based on our experience and analysis with the attitude and translational controllers, we have modified the basic configuration of the reinforcement learning algorithm in ARIC. The shuttle translational controller and its implementation in ARIC is described in our deliverable D3. In order to simulate the final approach and docking operations, we have set-up this special testcase as described in section 2. The ARIC performance results for these operations are discussed in section 3 and conclusions are provided in section 4 along with the summary for the project. Author

ON THE NAVIGATION OF POLAR ORBITING METEOROLOGICAL SATELLITES
Jaroslav Klokocnik (Ondrejov Observatory, Czechoslovakia.), Peter Schluessel (Hamburg Univ., Germany.), Jan Kostelecky (Research Inst. of Geodesy, Prague, Czechoslovakia.), and Hartmut Grassl (Hamburg Univ., Germany.) Oct. 1991 88 p
(MPIM-75; ETN-93-93446) Avail: CASI HC A05/MF A01

Satellite navigation, a process of identifying the space and time coordinates of the satellite data products (for example image), is introduced. An explanation of why satellite navigation without ground control points is tied to satellite orbit determination and prediction (ephemerides) is given. Software for the direct and inverse referencing (ORBITS, PIXPO) was studied and improved, or replaced by another software (ORBITEST, PIXPO 3 and 4). The validation tests performed showed that the accuracy achieved in determination of the time of culmination (or pixel line) and in the off nadir angle (or pixel number) is comparable to the present pixel size for the NOAA-N satellites, that is 1 to 5 km, provided that the orbital elements (NASA two line elements) are not older than about two weeks. The main obstacle for a further significant improvement is the low quality of the orbital elements. ESA

MSFC THREE POINT DOCKING MECHANISM DESIGN REVIEW
Otto Schaefer and Anthony Ambrosio Dec. 1992 73 p
(Contract NAS8-36641)
(NASA-CR-192462; NAS 1.26:192462; ATS-92-1) Avail: CASI HC A04/MF A01

In the next few decades, we will be launching expensive satellites and space platforms that will require recovery for economic reasons, because of initial malfunction, servicing, repairs, or out of a concern for post lifetime debris removal. The planned availability of a Three Point Docking Mechanism (TPDM) is a positive step towards an operational satellite retrieval infrastructure. This study effort supports NASA/MSFC engineering work in developing an automated docking capability. The work was performed by the Grumman Space & Electronics Group as a concept evaluation/test for the Tumbling Satellite Retrieval Kit. Simulation of a TPDM capture was performed in Grumman's Large Amplitude Space Simulator (LASS) using mockups of both parts (the mechanism and payload). Similar TPDM simulation activities and more extensive hardware testing was performed at NASA/MSFC in the Flight Robotics Laboratory and Space Station/Space Operations Mechanism Test Bed (6-DOF Facility). ROBUSTNESS
R. Ryan Mar. 1993 60 p
(NASA-TP-3336; M-716; NAS 1.60:3336) Avail: CASI HC A04/MF A01

Robustness is a buzz word common to all newly proposed space systems design as well as many new commercial products. The image that one conjures up when the word appears is a 'Paul Bunyon' (lumberjack design), strong and hearty; healthy with margins in all aspects of the design. In actuality, robustness is much broader in scope than margins, including such factors as simplicity, redundancy, desensitization to parameter variations, control of parameter variations (environments flucation), and operational approaches. These must be traded with concepts, materials, and fabrication approaches against the criteria of performance, cost, and reliability. This includes manufacturing, assembly, processing, checkout, and operations. The design engineer or project chief is faced with finding ways and means to inculcate robustness into an operational design. First, however, be sure he understands the definition and goals of robustness. This paper will deal with these issues as well as the need for the requirement for robustness. Author

TRAJECTORY OPTIMIZATION BASED ON DIFFERENTIAL INCLUSION Final Report
Hans Seywald Washington Feb. 1993 26 p
(Contract NAS1-18935; RTOP 506-59-61-02)
(NASA-CR-4501; NAS 1.26:4501) Avail: CASI HC A03/MF A01

A method for generating finite-dimensional approximations to the solutions of optimal control problems is introduced. By employing a description of the dynamical system in terms of its attainable sets in favor of using differential equations, the controls are completely eliminated from the system model. Besides reducing the dimensionality of the discretized problem compared to state-of-the-art collocation methods, this approach also alleviates the search for initial guesses from where standard gradient search methods are able to converge. The mechanics of the new method are illustrated on a simple double integrator problem. The performance of the new algorithm is demonstrated on a 1-D rocket ascent problem ('Goddard Problem') in presence of a dynamic pressure constraint. Author

ELECTROSTATIC CHARGING OF SPACECRAFT IN GEOSYNCHRONOUS ORBIT Ph.D. Thesis - London Univ., 1991
Andrew J. Sims 17 Dec. 1992 170 p Original contains color illustrations
(DRA-TM-Space-389; BR316597) Copyright Avail: CASI HC A08/MF A02

This Memorandum is a study of the spacecraft charging phenomenon applicable to satellites in geosynchronous orbit. Differential charging of spacecraft surfaces can induce electrostatic discharges which may manifest themselves as 'operational anomalies' or permanent damage to surface features such as solar cells and thermal control surfaces. Understanding of the problem is achieved via laboratory experiments, analysis of data from spacecraft instrumentation, and by numerical simulation. Long-term statistical studies are presented for the location of plasma boundaries at geostationary altitude and for the occurrence frequency and intensity of

geomagnetic substorms which permit the probability of severe charging conditions to be predicted for future missions. Laboratory experiments are used to demonstrate the importance of bulk and surface conductivity of dielectric materials to the charging process and a sensitivity analysis is employed to investigate the detailed interaction between the plasma environment and spacecraft surface materials. Finally, a study and simulation of charging events observed in geosynchronous orbit is presented.

SPACE STATION FREEDOM BETA GIMBAL CONTROL VIA SENSITIVITY MODELS

David A. Schoenwald (Martin Marietta Energy Systems, Inc., Oak Ridge, TN.), Umit Ozguner (Ohio State Univ., Columbus.), and Ronald E. Graham Jan. 1993 10 p

(NASA-TM-106000; E-7543; NAS 1.15:106000) Avail: CASI HC A02/MF A01

Tracking control of the Space Station Freedom solar array beta gimbals is investigated. Of particular interest is the issue of control in the presence of uncertainty in gimbal friction parameters. Sensitivity functions are incorporated into the feedback loop to desensitize the gimbal control law to parameter variations. Simulation results indicated that one such sensitivity function improves the closed-loop performance of the gimbals in the presence of unexpected friction parameter dispersions. Author

AN ANALYSIS OF POWER BEAMING FOR THE MOON AND MARS

Mark W. Stavnes Aug. 1992 8 p Presented at the 27th Intersociety Energy Conversion Engineering Conference, San Diego, CA, 3-7 Aug. 1992

(Contract NAS3-25266; RTOP 506-41-41)

(NASA-CR-191072; E-7581; NAS 1.26:191072) Avail: CASI HC A02/MF A01

Operations on the surface of the Moon and Mars will depend on a reliable source of electrical power. At NASA Lewis Research Center, the feasibility of powering lunar and Martian surface sites by power beaming was studied. Constellations of nuclear or solar powered satellites using microwave or laser transmitters were designed to power an equatorial surface base. Additional surface assets, such as rovers, can also be powered from the same orbiting satellites, requiring only the additional mass of a receiver. However, the actual mass and power capabilities of the system are dependent on the location of the surface receiver. The masses of the beam power systems can be reduced by up to 50 percent, by using the power source of an electric propulsion vehicle to power the beam system. The important analyses results and any additional issues that remain unresolved are discussed. Author

WHIPPLE BUMPER SHIELD RESULTS AND CTH SIMULATIONS AT VELOCITIES IN EXCESS OF 10 km/s

L. C. Chhabildas, E. S. Hertel, Jr., W. D. Reinhart, and J. M. Miller Sep. 1992 61 p

(Contract DE-AC04-76DP-00789)

(DE93-006932; SAND-91-2683) Avail: CASI HC A04/MF A01

A series of experiments has been performed on the Sandia HyperVelocity Launcher (HVL) to evaluate the effectiveness of a Whipple bumper shield to orbital space debris at impact velocities in excess of 10 km/s. Upon impact by a 0.67 g (0.87 mm thick) flier plate, the thin aluminum bumper shield disintegrates into a debris cloud. The debris cloud front propagates axially at velocities' of approximately 14 km/s and expands radially at a velocity of approximately 7 km/s. Subsequent loading on a 3.2 mm thick aluminum substructure by the debris penetrates the substructure completely. However, when the mass of the flier plate is reduced to 0.33 g, the substructure, although damaged, is not perforated over the duration of the experiment. Numerical simulations performed using the multi-dimensional hydrodynamics code CTH also predict complete penetration of the substructure by the subsequent debris cloud for a 0.87 g flier plate. The numerical simulations for a 0.33 g flier plate show a strong dependence on assumed impact geometry. For the assumption of a spherical projectile impact geometry, perforation of the substructure by the subsequent debris cloud is not predicted by CTH. DOE

PRELIMINARY OARE ABSOLUTE ACCELERATION MEASUREMENTS ON STS-50

Robert C. Blanchard, John Y. Nicholson (Vigyan Research Associates, Inc., Hampton, VA.), and James Ritter (Lockheed Engineering and Sciences Co., Hampton, VA.) Feb. 1993 30 p

(RTOP 506-48-11-05)

(NASA-TM-107724; NAS 1.15:107724) Avail: CASI HC A03/MF A01

On-orbit Orbital Acceleration Research Experiment (OARE) data on STS-50 was examined in detail during a 2-day time period. Absolute acceleration levels were derived at the OARE location, the orbiter center-of-gravity, and at the STS-50 spacelab Crystal Growth Facility. The tri-axial OARE raw acceleration measurements (i.e., telemetered data) during the interval were filtered using a sliding trimmed mean filter in order to remove large acceleration spikes (e.g., thrusters) and reduce the noise. Twelve OARE measured biases in each acceleration channel during the 2-day interval were analyzed and applied to the filtered data. Similarly, the in situ measured x-axis scale factors in the sensor's most sensitive range were also analyzed and applied to the data. Due to equipment problem(s) on this flight, both y- and z- axis sensitive range scale factors were determined in a separate process (using the OARE maneuver data) and subsequently applied to the data. All known significant low-frequency corrections at the OARE location (i.e., both vertical and horizontal gravity-gradient, and rotational effects) were removed from the filtered data in order to produce the acceleration components at the orbiter's center-of-gravity, which are the aerodynamic signals along each body axes. Results indicate that there is a force of unknown origin being applied to the Orbiter in addition to the aerodynamic forces. The OARE instrument and all known gravitational and electromagnetic forces were reexamined, but none produce the observed effect. Thus, it is tentatively concluded that the Orbiter is creating the environment observed. Author

SPACE STATION FREEDOM UTILIZATION CONFERENCE: EXECUTIVE SUMMARY

In its Space Station Freedom Utilization Conference 1992 p 3-31 (For primary document see N93-22606 08-18)

Avail: CASI HC A03/MF A04

From August 3-6, 1992, Space Station Freedom Program (SSFP) representatives and prospective Space Station Freedom researchers gathered at the Von Braun Civic Center in Huntsville, Alabama, for NASA's first annual Space Station Freedom (SSF) Utilization Conference. The sessions presented are: (1) overview and research capabilities; (2) research plans and opportunities; (3) life sciences research; (4) technology research; (4) microgravity research and biotechnology; and (5) closing plenary.

INTRODUCTION TO SPACE STATION FREEDOM

Richard Kohrs *In its* Space Station Freedom Utilization Conference 1992 p 41-45 (For primary document see N93-22606 08-18)

Avail: CASI HC A01/MF A04

NASA field centers and contractors are organized to develop 'work packages' for Space Station Freedom. Marshall Space Flight Center and Boeing are building the U.S. laboratory and habitation modules, nodes, and environmental control and life support system; Johnson Space Center

and McDonnell Douglas are responsible for truss structure, data management, propulsion systems, thermal control, and communications and guidance; Lewis Research Center and Rocketdyne are developing the power system. The Canadian Space Agency (CSA) is contributing a Mobile Servicing Center, Special Dextrous Manipulator, and Mobile Servicing Center Maintenance Depot. The National Space Development Agency of Japan (NASDA) is contributing a Japanese Experiment Module (JEM), which includes a pressurized module, logistics module, and exposed experiment facility. The European Space Agency (ESA) is contributing the Columbus laboratory module. NASA ground facilities, now in various stages of development to support Space Station Freedom, include: Marshall Space Flight Center's Payload Operations Integration Center and Payload Training Complex (Alabama), Johnson Space Center's Space Station Control Center and Space Station Training Facility (Texas), Lewis Research Center's Power System Facility (Ohio), and Kennedy Space Center's Space Station Processing Facility (Florida). Budget appropriations impact the development of the Space Station. In Fiscal Year 1988, Congress appropriated only half of the funds that NASA requested for the space station program ($393 million vs. $767 million). In FY 89, NASA sought $967 million for the program, and Congress appropriated $900 million. NASA's FY 90 request was $2.05 billion compared to an appropriation of $1.75 billion; the FY 91 request was $2.45 billion, and the appropriation was $1.9 billion. After NASA restructured the Space Station Freedom program in response to directions from Congress, the agency's full budget request of $2.029 billion for Space Station Freedom in FY 92 was appropriated. For FY 93, NASA is seeking $2.25 billion for the program; the planned budget for FY 94 is $2.5 billion. Further alterations to the hardware configuration for Freedom would be a serious setback; NASA intends 'to stick with the current baseline' and continue planning for utilization. Author

SPACE STATION FREEDOM RESEARCH CAPABILITIES

Robert Moorehead *In its* Space Station Freedom Utilization Conference 1992 p 47-59 (For primary document see N93-22606 08-18)
Avail: CASI HC A03/MF A04

NASA's plan for enhancing space-based research capabilities begins with extended-duration Space Shuttle missions that will double the research capability currently provided by Spacelab and culminate in Space Station Freedom. The 14-day USML 1 mission flown on the Space Shuttle in June 1992 was a space station precursor mission, dedicated to microgravity and life science research. Freedom will be a permanent space-based research facility, providing a working environment nearly free of buoyancy-driven convection, sedimentation, and hydrostatic pressure and featuring access to the ultra-high vacuum of space (for external payloads). In its crew-tended phase, Space Station Freedom will provide 40 times Spacelab's capability, and in its permanently occupied phase, Freedom will provide 110 times Spacelab's capability. (The Russian space station, Mir, offers 26 times Spacelab's capabilities.) According to NASA's current schedule, the first launch of a space station element will take place in November 1995, with permanently occupied capability planned for September 1999. This year, NASA will conduct space station critical design reviews (CDR's). Work package design reviews will take place from February to April 1993, followed by a systems CDR. Author

OPPORTUNITIES FOR RESEARCH ON SPACE STATION FREEDOM

Robert W. Phillips *In its* Space Station Freedom Utilization Conference 1992 p 61-71 (For primary document see N93-22606 08-18)
Avail: CASI HC A02/MF A04

NASA has allocated research accommodations on Freedom (equipment, utilities, etc.) to the program offices that sponsor space-based research and development as follows: Space Science and Applications (OSSA)--52 percent, Commercial Programs (OCP)--28 percent, Aeronautics and Space Technology (OAST)--12 percent, and Space Flight (OSF)--8 percent. Most of OSSA's allocation will be used for microgravity and life science experiments; although OSSA's space physics, astrophysics, earth science and applications, and solar system exploration divisions also will use some of this allocation. Other Federal agencies have expressed an interest in using Space Station Freedom. They include the National Institutes of Health (NIH), U.S. Geological Survey, National Science Foundation, National Oceanic and Atmospheric Administration, and U.S. Departments of Agriculture and Energy. Payload interfaces with space station lab support equipment must be simple, and experiment packages must be highly contained. Freedom's research facilities will feature International Standard Payload Racks (ISPR's), experiment racks that are about twice the size of a Spacelab rack. ESA's Columbus lab will feature 20 racks, the U.S. lab will have 12 racks, and the Japanese lab will have 10. Thus, Freedom will have a total of 42 racks versus 8 for Space lab. NASA is considering outfitting some rack space to accommodate small, self-contained payloads similar to the Get-Away-Special canisters and middeck-locker experiment packages flown on Space Shuttle missions. Crew time allotted to experiments on Freedom at permanently occupied capability will average 25 minutes per rack per day, compared to six hours per rack per day on Spacelab missions. Hence, telescience--the remote operation of space-based experiments by researchers on the ground--will play a very important role in space station research. Plans for supporting life sciences research on Freedom focus on the two basic goals of NASA 's space life sciences program: to ensure the health, safety, and productivity of humans in space and to acquire fundamental knowledge of biological processes. Space-based research has already shown that people and plants respond the same way to the microgravity environment: they lose structure. However, the mechanisms by which they respond are different, and researchers do not yet know much about these mechanisms. Life science research accommodations on Freedom will include facilities for experiments designed to address this and other questions, in fields such as gravitational biology, space physiology, and biomedical monitoring and countermeasures research. HOW TO GET ON BOARD SPACE STATION FREEDOM

John-David Bartoe *In its* Space Station Freedom Utilization Conference 1992 p 73-94 (For primary document see N93-22606 08-18)
Avail: CASI HC A03/MF A04

Space Station Freedom will accommodate researchers with interests in science, technology and commercial applications. NASA sponsors will be responsible for selecting the U.S. researchers for Space Station Freedom. The four NASA sponsors are: Office of Space Science and Applications (OSSA), Office of Aeronautics and Space Technology (OAST), Office of Commercial Programs (OCP), and the Office of Space Flight (OSF). The areas of research responsibility for each sponsor are presented. The researcher solicitation vehicles used by OSSA and OAST and the methodology for researchers seeking sponsorship from OCP and OSF as well as the pricing policy are discussed. Descriptions of flight planning, payload integration and operations functions are presented. Three categories of payloads and their respective payload integration times are discussed. Researchers are advised to contact a NASA sponsor and a source which lists the points of contact for the NASA sponsors is noted. Author

NASA'S COMMERCIAL RESEARCH PLANS AND OPPORTUNITIES

Ray J. Arnold *In its* Space Station Freedom Utilization Conference 1992 p 97-111 (For primary document see N93-22606 08-18)
Avail: CASI HC A03/MF A04

One of the primary goals of the National Aeronautics and Space Administration's (NASA) commercial space development plan is to encourage the development of space-based products and markets, along with the infrastructure and transportation that will support those products and markets. A three phased program has been instituted to carry out this program. The first phase utilizes government grants through the Centers for the Commercial Development of Space (CCDS) for space-related, industry driven research; the development of a technology data base; and the development of commercial space transportation and infrastructure. The second phase includes the development of these technologies by industry for new commercial markets, and features unique industry/government collaborations such as Joint Endeavor Agreements. The final phase will feature technical applications actually brought to the marketplace. The government's role will be to support industry required infrastructure to encourage start-up markets and industries through follow-on development agreements such as the Space Systems Development Agreement. The Office of Commercial Programs has an aggressive flight program underway on the Space Shuttle,

suborbital rockets, orbital expendable launch vehicles, and the Commercial Middeck Accommodation Module with SPACEHAB Inc. The Office of Commercial Program's has been allocated 35 percent of the U.S. share of the Space Station Freedom resources for 1997 utilization. A utilization plan has been developed with the Centers for the Commercial Development of Space and has identified eleven materials processing and biotechnology payloads occupying 5 double racks in the pressurized module as well as two payloads external to the module in materials exposure and environment monitoring. The Office of Commercial Programs will rely on the Space Station Freedom to provide the long duration laboratory component for space-based commercial research. Author

SPACE TECHNOLOGY RESEARCH PLANS

W. Ray Hook *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 113-128 (For primary document see N93-22606 08-18)

Avail: CASI HC A03/MF A04

Development of new technologies is the primary purpose of the Office of Aeronautics and Space Technology (OAST). OAST's mission includes the following two goals: (1) to conduct research to provide fundamental understanding, develop advanced technology and promote technology transfer to assure U.S. preeminence in aeronautics and to enhance and/or enable future civil space missions: and (2) to provide unique facilities and technical expertise to support national aerospace needs. OAST includes both NASA Headquarters operations as well as programmatic and institutional management of the Ames Research Center, the Langley Research Center and the Lewis Research Center. In addition. a considerable portion of OAST's Space R&T Program is conducted through the flight and science program field centers of NASA. Within OAST, the Space Technology Directorate is responsible for the planning and implementation of the NASA Space Research and Technology Program. The Space Technology Directorate's mission is 'to assure that OAST shall provide technology for future civil space missions and provide a base of research and technology capabilities to serve all national space goals.' Accomplishing this mission entails the following objectives: y Identify, develop, validate and transfer technology to: (1) increase mission safety and reliability; (2) reduce flight program development and operations costs; (3) enhance mission performance; and (4) enable new missions. Provide the capability to: (1) advance technology in critical disciplines; and (2) respond to unanticipated mission needs. In-space experiments are an integral part of OAST's program and provides for experimental studies, development and support for in-space flight research and validation of advanced space technologies. Conducting technology experiments in space is a valuable and cost effective way to introduce advanced' technologies into flight programs. These flight experiments support both the R&T base and the focussed programs within OAST. Author

OSSA SPACE STATION FREEDOM SCIENCE UTILIZATION PLANS

Philip J. Cressy *In its* Space Station Freedom Utilization Conference 1992 p 129-135 (For primary document see N93-22606 08-18)

Avail: CASI HC A02/MF A04

Long duration exposure to an essentially zero-gravity environment is a phenomenon exclusive to the Space Station Freedom that cannot be duplicated on Earth. The Freedom Station will offer periods of time on orbit extending to weeks and months rather than hours or days, allowing for in-depth space based research and analysis to a degree never before achieved. OSSA remains committed to exploiting the unique capabilities provided by the Space Station as well as other space-based facilities to study the nature of physical, chemical, and biological processes in a low-gravity environment and to apply these studies to advance science and applications in such fields as biomedical research, plant and animal physiology, exobiology, biotechnology, materials science, fluid physics, and combustion science. The OSSA focus is on progressive science investigations, many requiring hands-on scientist involvement using sophisticated experiment hardware. OSSA science utilization planning for the Freedom Station is firmly established. For this presentation, this planning is discussed in three general areas: OSSA goals and overall approach, the current and on-going program, and plans for space station utilization. In the first area, OSSA addresses its overall approach to space science research, its commitment to transition to Space Station Freedom, and its top-level strategy for the utilization of Freedom. The current and on-going program is next discussed, focusing on the various Spacelab series of missions which are providing the stepping-stones to Space Station Freedom. Selected science results from SLS-1 and USML-1 are cited which underline the value of properly outfitted laboratories in space in which crew-intensive experiment interactions are possible. The presentation is concluded with a discussion of top-level goals and strategies for utilizing the Freedom Station by OSSA's Life Sciences Division and its Microgravity Science and Applications Division. COMMERCIAL RESEARCHER PERSPECTIVE

Larry DeLucas *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 137-145 (For primary document see N93-22606 08-18)

Avail: CASI HC A02/MF A04

Protein crystallography--a research tool used to study the structure of the complex building blocks of living systems--has a lot to gain from space-based research. In order to know how a protein works in the human body, researchers must understand its molecular structure. Researchers have identified 150,000 different proteins in the body, but they now know the structure of less than a third of them. The only viable technique for analyzing the structure of these proteins is x-ray diffraction of the proteins in their crystal form. The better the quality of a protein crystal, the more useful it is to researchers who are trying to delineate its structure. The microgravity environment of space allows protein crystals to grow nearly undisturbed by convection and other gravity-driven forces that cause flaws to form in them on the ground. In space, lack of convection enables protein crystals to grow more slowly than they do on Earth, and the slower a protein crystal grows, the fewer flaws it will have. Protein crystal growth experiments have already flown on 14 Space Shuttle missions. This year's USML-1 Spacelab mission included protein crystal growth experiments conducted for commercial researchers. The results of protein crystal experiments flown thus far have been larger crystals with more uniform morphologies. The Center for Macromolecular Crystallography (A NASA-cosponsored CCDS) currently builds flight hardware to meet researchers' needs and handles sample loading and retrieval for flight experiments. Protein crystallography enables 'rational drug design': the development of drugs that bind only with the target protein and, hence, do not cause side effects. For example, pharmaceutical companies presently are interested in developing drugs that can inhibit purine nucleoside phosphorylase (PNP), a protein that plays a role in auto-immune diseases. To continue these kinds of investigations, researchers need a constant supply of protein crystals that are as free of flaws as possible. Space Station Freedom will provide the kind of research environment that will enable the production of such supplies. In addition, Freedom will provide the kind of long-duration facility required by protein crystal researchers: 40 percent of proteins require more than two weeks to crystallize. Author

JAPANESE PLAN FOR SSF UTILIZATION

Toshio Mizuno *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 147-164 (For primary document see N93-22606 08-18)

Avail: CASI HC A03/MF A04

The Japanese Experiment Module (JEM) program has made significant progress. The JEM preliminary design review was completed in July 1992; construction of JEM operation facilities has begun; and the micro-G airplane, drop shaft, and micro-G experiment rocket are all operational. The national policy for JEM utilization was also established. The Space Experiment Laboratory (SEL) opened in June '92 and will function as a user support center. Eight JEM multiuser facilities are in phase B, and scientific requirements are being defined for 17 candidate multiuser facilities. The National Joint Research Program is about to start. Precursor missions and early Space Station utilization activities are being defined. This paper summarizes the program in outline and graphic form. Author (revised)

CANADIAN SPACE AGENCY SPACE STATION FREEDOM UTILIZATION PLANS
James Faulkner and Ron Wilkinson *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 165-173 (For primary document see N93-22606 08-18)
Avail: CASI HC A02/MF A04

Under the terms of the NASA/CSA Memorandum of Understanding, Canada will contribute the Mobile Servicing System and be entitled to use 3 percent of all Space Station utilization resources and user accommodations over the 30 year life of the Station. Equally importantly Canada, like NASA, can begin to exploit these benefits as soon as the Man-Tended Capability (MTC) phase begins, in early 1997. Canada has been preparing its scientific community to fully utilize the Space Station for the past five years; most specifically by encouraging, and providing funding, in the area of Materials Science and Applications, and in the area of Space Life Sciences. The goal has been to develop potential applications and an experienced and proficient Canadian community able to effectively utilize microgravity environment facilities such as Space Station Freedom. In addition, CSA is currently supporting four facilities; a Laser Test System, a Large Motion Isolation Mount, a Canadian Float Zone Furnace, and a Canadian Protein Crystallization Apparatus. In late April of this year CSA sent out a Solicitation of Interest (SOI) to potential Canadian user from universities, industry, and government. The intent of the SOI was to determine who was interested, and the type of payloads which the community at large intended to propose. The SOI will be followed by the release of an Announcement of Opportunity (AO) following governmental approval of the Long Term Space plan later this year, or early next year. Responses to the AO will be evaluated and prioritized in a fair and impartial payload selection process, within the guidelines set by our international partners and the Canadian Government. Payload selection is relatively simple compared to the development and qualification process. An end-to-end user support program is therefore also being defined. Much of this support will be provided at the new headquarters currently being built in St. Hubert, Quebec. It is recognized that utilizing the Space Station could be expensive for users; costing in many cases millions of dollars to get a payload from conception to retrieval. It is also recognized that some of the potential users cannot or will not invest a lot of money or effort into Space Station utilization, unless there is a perceived significant commercial potential. How best to fund Space Station payloads is under study. Space Station Freedom will provide the first opportunity for Canada to conduct experiments in a long-duration microgravity environment. CSA have been developing and funding potential users for some time, and considerable interest has been shown by the response to our SOI earlier this year. Canada can be one of the two earliest users for the Space Station, along with NASA. We hope to take full advantage of this opportunity. Author

It is now generally acknowledged that the life science discipline will be the primary beneficiary of Space Station Freedom. The unique facility will permit advances in understanding the consequences of long duration exposure to weightlessness and evaluation of the effectiveness of countermeasures. It will also provide an unprecedented opportunity for basic gravitational biology, on plants and animals as well as human subjects. The major advantages of SSF are the long duration exposure and the availability of sufficient crew to serve as subjects and operators. In order to fully benefit from the SSF, life sciences will need both sufficient crew time and communication abilities. Unlike many physical science experiments, the life science investigations are largely exploratory, and frequently bring unexpected results and opportunities for study of newly discovered phenomena. They are typically crew-time intensive, and require a high degree of specialized training to be able to react in real time to various unexpected problems or potentially exciting findings. Because of the long duration tours and the large number of experiments, it will be more difficult than with Spacelab to maintain astronaut proficiency on all experiments. This places more of a burden on adequate communication and data links to the ground, and suggests the use of AI expert system technology to assist in astronaut management of the experiment. Typical life science experiments, including those flown on Spacelab Life Sciences 1, will be described from the point of view of the demands on the astronaut. A new expert system, 'PI in a Box,' will be introduced for SLS-2, and its applicability to other SSF experiments discussed. (This paper consists on an abstract and ten viewgraphs.) Author (revised)

RESEARCH EXPERIENCES ON MATERIALS SCIENCE IN SPACE ABOARD SALYUT AND MIR
Liya L. Regel *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 187-204 (For primary document see N93-22606 08-18)
Avail: CASI HC A03/MF A04

From 1980 through 1991 approximately 500 materials processing experiments were performed aboard the space stations Salyut 6, Salyut 7 and Mir. This includes work on catalysts, polymers, metals and alloys, optical materials, superconductors, electronic crystals, thin film semiconductors, super ionic crystals, ceramics, and protein crystals. Often the resulting materials were surprisingly superior to those prepared on earth. The Soviets were the first to fabricate a laser (CdS) from a crystal grown in space, the first to grow a heterostructure in space, the first super ionic crystal in space, the first crystals of CdTe and its alloys, the first zeolite crystals, the first protein crystals, the first chromium disilicide glass, etc. The results were used to optimize terrestrial materials processing operations in Soviet industry. The characteristics of these three space stations are reviewed, along with the advantages of a space station for materials research, and the problems encountered by the materials scientists who used them. For example, the stations and the materials processing equipment were designed without significant input from the scientific community that would be using them. It is pointed out that successful results have been achieved also by materials processing at high gravity in large centrifuges. This research is also continuing around the world, including at Clarkson University. It is recommended that experiments be conducted in centrifuges in space, in order to investigate the acceleration regime between earth's gravity and the microgravity achieved in orbiting space stations. One cannot expect to understand the influence of gravity on materials processing from only two data points, earth's gravity and microgravity. One must also understand the influence of fluctuations in acceleration on board space stations, the so-called 'g-jitter.' This paper is presented in outline and graphical form. Author (revised)

Space Station Freedom will provide the United States' first permanently manned laboratory in space. It will allow, for the first time, long term systematic life sciences investigations in microgravity. This presentation provides a top-level overview of the planned utilization of Space Station Freedom by NASA's Life Sciences Division. The historical drivers for conducting life sciences research on a permanently manned laboratory in space as well as the advantages that a space station platform provides for life sciences research are discussed. This background information leads into a description of NASA's strategy for having a fully operational International Life Sciences Research Facility by the year 2000. Achieving this capability requires the development of the five discipline focused 'common core' facilities. Once developed, these facilities will be brought to the space station during the Man-Tended Capability phase, checked out and brought into operation. Their delivery must be integrated with the Space Station Freedom manifest. At the beginning of Permanent Manned Capability, the infrastructure is expected to be completed and the Life Sciences Division's SSF Program will become fully operational. A brief facility description, anticipated launch date and a focused objective is provided for each of the life sciences facilities, including the Biomedical Monitoring and Countermeasures (BMAC) Facility, Gravitational Biology Facility (GBF), Gas Grain Simulation Facility (GGSF), Centrifuge Facility (CF), and Controlled Ecological Life Support System (CELSS) Test Facility. In addition, hardware developed by other NASA organizations and the SSF International Partners for an International Life Sciences Research Facility is also discussed. Author (revised)

LIFE SCIENCES RECRUITMENT OBJECTIVES **c51**

J. Richard Keefe *In its* Space Station Freedom Utilization Conference 1992 p 221-233 (For primary document see N93-22606 08-18)
Avail: CASI HC A03/MF A04

The goals of the Life Sciences Division of the Office of Space Sciences and Application are to ensure the health, well being and productivity of humans in space and to acquire fundamental scientific knowledge in space life sciences. With these goals in mind Space Station Freedom represents substantial opportunities and significant challenges to the Life Sciences Division. For the first time it will be possible to replicate experimental data from a variety of simultaneously exposed species with appropriate controls and real-time analytical capabilities over extended periods of time. At the same time, a system for monitoring and ameliorating the physiological adaptations that occur in humans subjected to extended space flight must be evolved to provide the continuing operational support to the SSF crew. To meet its goals, and take advantage of the opportunities and overcome the challenges presented by Space Station Freedom, the Life Sciences Division is developing a suite of discipline-focused sequence. The research phase of the Life Sciences Space Station Freedom Program will commence with the utilization flights following the deployment of the U.S. laboratory module and achievement of Man Tended Capability. Investigators that want the Life Sciences Division to sponsor their experiment on SSF can do so in one of three ways: submitting a proposal in response to a NASA Research Announcement (NRA), submitting a proposal in response to an Announcement of Opportunity (AO), or submitting an unsolicited proposal. The scientific merit of all proposals will be evaluated by peer review panels. Proposals will also be evaluated based on relevance to NASA's missions and on the results of an Engineering and Cost Analyses. The Life Sciences Division expects that the majority of its funding opportunities will be announced through NRA's. It is anticipated that the first NRA will be released approximately three years before first element launch (currently scheduled for late 1995). Subsequent NRA's will be released on a rotating two year cycle. Author

BIOMEDICAL MONITORING AND COUNTERMEASURES FACILITY **c51**

Donald F. Stewart *In its* Space Station Freedom Utilization Conference 1992 p 235-249 (For primary document see N93-22606 08-18)
Avail: CASI HC A03/MF A04

The Space Station Freedom Program (SSFP) represents the transition within the US Space program from the 'heroic' era of space flight (characterized most vividly by the Mercury and Apollo programs) to an epoch characterized by routine access to the space environment. In this new era, the unique characteristics of the microgravity environment will enable new types of research activities, primarily in the life sciences, materials science, and biotechnology fields. In addition to its role as a'microgravity science laboratory,' Space Station Freedom (SSF) constitutes the operational platform on which the knowledge and skills needed to continue our exploration of space will be acquired. In the area of spacecraft operations, these skills include the ability to assemble, operate, and maintain large structures in space. In the area of crew operations, the potentially harmful effects of extended exposure to microgravity must be understood in order to keep the crew mission capable. To achieve this goal, the complex process of physiological deconditioning must be monitored, and countermeasures utilized as needed to keep the individual crew members within acceptable physiological limits. The countermeasures program under development for the SSF Program is titled the Biomedical Monitoring and Countermeasures (BMAC) program. As implied by the name, this activity has two primary products, a biomedical monitoring element and a countermeasures development effort. The program is a critical path element in the overall SSF Program, and should be considered an essential element of operations on board the space station. It is readily apparent that the capability to both protect and optimize the health and performance of the human operators on board SSF will be a critical element in the overall success of the SSFP. Previous experience within the Russian space program has demonstrated that the time required for countermeasures on extended missions can become a monumental operational burden. Therefore, one of the primary objectives of the countermeasures development activity will be to design and implement countermeasures which are significantly more effective than the existing generation. Other primary objectives include the following: to set health and human performance standards for all mission phases; to determine critical issues that affect performance or return to flight status; to develop and implement monitoring systems to follow health and performance status; and to understand risk, and balance the resource costs of countermeasures vs. the benefit gained. GRAVITATIONAL BIOLOGY FACILITY ON SPACE STATION: MEETING THE NEEDS OF SPACE BIOLOGY **c51**

Katherine Allen and Charles Wade *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 251-259 (For primary document see N93-22606 08-18)
Avail: CASI HC A02/MF A04

The Gravitational Biology Facility (GBF) is a set of generic laboratory equipment needed to conduct research on Space Station Freedom (SSF), focusing on Space Biology Program science (Cell and Developmental Biology and Plant Biology). The GBF will be functional from the earliest utilization flights through the permanent manned phase. Gravitational biology research will also make use of other Life Sciences equipment on the space station as well as existing equipment developed for the space shuttle. The facility equipment will be developed based on requirements derived from experiments proposed by the scientific community to address critical questions in the Space Biology Program. This requires that the facility have the ability to house a wide variety of species, various methods of observation, and numerous methods of sample collection, preservation, and storage. The selection of the equipment will be done by the members of a scientific working group (5 members representing cell biology, 6 developmental biology, and 6 plant biology) who also provide requirements to design engineers to ensure that the equipment will meet scientific needs. All equipment will undergo extensive ground based experimental validation studies by various investigators addressing a variety of experimental questions. Equipment will be designed to be adaptable to other space platforms. The theme of the Gravitational Biology Facility effort is to provide optimal and reliable equipment to answer the critical questions in Space Biology as to the effects of gravity on living systems. GAS-GRAIN SIMULATION FACILITY (GGSF) **c29**

Ken Greenwald *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 261-274 (For primary document see N93-22606

08-18)
Avail: CASI HC A03/MF A04

The goal of the Gas-Grain Simulation Facility project is to provide a microgravity laboratory to facilitate research relevant to exobiology (the study of the origin and evolution of life in the universe). Such a facility will also be useful in other areas of study important to NASA including planetary science, biology, atmospheric science, astrophysics, chemistry, and physics. To achieve this goal, the project will develop and support the GGSF, a modular facility-class payload planned for inclusion on Space Station Freedom. The GGSF will consist of the following: an experiment chamber(s) supported by subsystems that provide chamber environment regulation and monitoring capabilities; sample generation, injection, positioning, and retrieval capabilities; and computer control, data acquisition, and housekeeping capabilities. The facility will also provide analytical tools such as light-scattering measurement systems, aerosol size-spectrum measurement devices, and optical imaging systems. Author (revised)

RESEARCH OPPORTUNITIES WITH THE CENTRIFUGE FACILITY

Glenn A. Funk *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 275-281 (For primary document see N93-22606 08-18)
Avail: CASI HC A02/MF A04

The Centrifuge Facility on Space Station Freedom will consist of a 2.5-meter diameter Centrifuge accommodating two concentric rings of habitats and providing variable g-forces between 0.01 g and 2.0 g; modular habitats providing housing and lifesupport for rats, mice, and plants; a habitat holding system providing power, water, airflow and other utilities to several modular habitats; and a life sciences glovebox, an isolated work volume accommodating simultaneous operations by at least two scientists and providing lighting, airflow, video and data access, and other experiment support functions. The centrifuge facility will enable long-duration animal and plant microgravity research not previously possible in the NASA flight research program. It will offer unprecedented opportunities for use of on-board 1-g control populations and statistically significant numbers of specimens. On orbit 1-g controls will allow separation of the effects of microgravity from other environmental factors. Its selectable-g and simultaneous multiple-g capabilities will enable studies of gravitational thresholds, the use of artificial gravity as a countermeasure to the effects of microgravity, and ready simulation of Lunar and Martian gravities.

CLOSED ECOLOGICAL LIFE SUPPORT SYSTEMS (CELSS) TEST FACILITY **c54**

Robert D. MacElroy *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 283-290 (For primary document see N93-22606 08-18)
Avail: CASI HC A02/MF A04

The CELSS Test Facility (CTF) is being developed for installation on Space Station Freedom (SSF) in August 1999. It is designed to conduct experiments that will determine the effects of microgravity on the productivity of higher (crop) plants. The CTF will occupy two standard SSF racks and will accommodate approximately one square meter of growing area and a canopy height of 80 cm. The growth volume will be isolated from the external environment, allowing stringent control of environmental conditions. Temperature, humidity, oxygen, carbon dioxide, and light levels will all be closely controlled to prescribed set points and monitored. This level of environmental control is needed to prevent stress and allow accurate assessment of microgravity effect (10-3 to 10-6 x g). Photosynthetic rates and respiration rates, calculated through continuous recording of gas concentrations, transpiration, and total and edible biomass produced will be measured. Toxic byproducts will be monitored and scrubbed. Transpiration water will be collected within the chamber and recycled into the nutrient solution. A wide variety of crop plants, e.g., wheat, soy beans, lettuce, potatoes, can be accommodated and various nutrient delivery systems and light delivery systems will be available. In the course of its development, the CTF will exploit fully, and contribute importantly, to the state-of-art in closed system technology and plant physiology. Author (revised)

AN ON-ORBIT VIEWPOINT OF LIFE SCIENCES RESEARCH Abstract Only **c51**

Byron K. Lichtenberg *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 291 (For primary document see N93-22606 08-18)
Avail: CASI HC A01/MF A04

As a Payload Specialist and a life science researcher, I want to present several issues that impact life science research in space. During early space station operations, life science and other experiments will be conducted in a time-critical manner and there will be the added duties of both space shuttle and space station systems operation (and the concomittent training overhead). Life sciences research is different from other science research done in space because the crew is involved both as an operator and as a subject. There is a need for pre- and post-flight data collection as well as in flight data collection. It is imperative that the life science researcher incorporate the crew members into their team early enough in the training cycle to fully explain the science and to make the crew aware of the importance and sensitivities of the experiment. During the pre-flight phase, the crew is incredibly busy with a myriad of duties. Therefore, it is difficult to get 'pristine' subjects for the baseline data collection. There are also circadian shifts, travel, and late nights to confound the data. During this time it is imperative that the researcher develop, along with the crew, a realistic estimate of crew-time required for their experiment. In flight issues that affect the researcher are the additional activities of the crew, the stresses inherent in space flight, and the difficulty of getting early in-flight data. During SSF activities, the first day or two will be taken up with rendezvous and docking. Other issues are the small number of subjects on any given flight, the importance of complete and concise procedures, and the vagaries of on-board data collection. Post flight, the crew is tired and experiences a 'relaxation.' This along with circadian shifts and rapid re-adaptation to 1-g make immediate post-flight data collection difficult. Finally, the blending of operational medicine and research can result in either competition for resources (crew time, etc.) or influence on the physiological state of the crew. However, the unique opportunity to conduct research in an environment that cannot be duplicated on Earth outweighs the 'challenges' that exist for space life researchers.

CREW HEALTH **c52**

Roger D. Billica *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 293-299 (For primary document see N93-22606 08-18)
Avail: CASI HC A02/MF A04

Crew health concerns for Space Station Freedom are numerous due to medical hazards from isolation and confinement, internal and external environments, zero gravity effects, occupational exposures, and possible endogenous medical events. The operational crew health program will evolve from existing programs and from life sciences investigations aboard Space Station Freedom to include medical monitoring and certification, medical intervention, health maintenance and countermeasures, psychosocial support, and environmental health monitoring. The knowledge and experience gained regarding crew health issues and needs aboard Space Station Freedom will be used not only to verify requirements and programs for long duration space flight, but also in planning and preparation for Lunar and Mars exploration and colonization. SPACE STATION FREEDOM AS AN ENGINEERING EXPERIMENT STATION: AN OVERVIEW

M. Frank Rose *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 303-311 (For primary document see N93-22606 08-18)
Avail: CASI HC A02/MF A04

In this presentation, the premise that Space Station Freedom has great utility as an engineering experiment station will be explored. There are several modes in which it can be used for this purpose. The most obvious are space qualification, process development, in space satellite repair, and materials engineering. The range of engineering experiments which can be done at Space Station Freedom run the gamut from small

process oriented experiments to full exploratory development models. A sampling of typical engineering experiments are discussed in this session. First and foremost, Space Station Freedom is an elaborate experiment itself, which, if properly instrumented, will provide engineering guidelines for even larger structures which must surely be built if humankind is truly 'outward bound.' Secondly, there is the test, evaluation and space qualification of advanced electric thruster concepts, advanced power technology and protective coatings which must of necessity be tested in the vacuum of space. The current approach to testing these technologies is to do exhaustive laboratory simulation followed by shuttle or unmanned flights. Third, the advanced development models of life support systems intended for future space stations, manned mars missions, and lunar colonies can be tested for operation in a low gravity environment. Fourth, it will be necessary tc develop new protective coatings, establish construction techniques, evaluate new materials to be used in the upgrading and repair of Space Station Freedom. Finally, the industrial sector, if it is ever to build facilities for the production of commercial products, must have all the engineering aspects of the process evaluated in space prior to a commitment to such a facility. PRECURSOR SSF UTILIZATION: THE MODE EXPERIMENTS

Edward F. Crawley *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 321-333 (For primary document see N93-22606 08-18)

Avail: CASI HC A03/MF A04

The MIT Space Engineering Research Center is the principal investigator for a series of experiments which utilize the Shuttle Middeck as an engineering dynamics laboratory. The first, which flew on STS-48 in Sep. 1991, was the Middeck O-gravity Dynamics Experiment (MODE). This experiment focused on the dynamics of a scaled deployable truss, similar to that of SSF, and contained liquids in tanks. MODE will be reflown in the fall of 1993. In mid-1994, the Middeck Active Control Experiment (MACE) will examine the issues associated with predicting and verifying the closed loop behavior of a controlled structure in zero gravity. The paper will present experiment background, planning, operational experience, results, and lessons learned from these experiments which are pertinent to SSF utilization. Author (revised)

UTILIZATION OF SPACE STATION FREEDOM FOR TECHNOLOGY RESEARCH

Don E. Avery *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 335-347 (For primary document see N93-22606 08-18)

Avail: CASI HC A03/MF A04

Space Station Freedom presents a unique opportunity for technology developers to conduct research in the space environment. Research can be conducted in the pressurized volume of the Space Station's laboratories or attached to the Space Station truss in the vacuum of space. Technology developers, represented by the Office of Aeronautics and Space Technology (OAST), will have 12 percent of the available Space Station resources (volume, power, data, crew, etc.) to use for their research. Most technologies can benefit from research on Space Station Freedom and all these technologies are represented in the OAST proposed traffic model. This traffic model consists of experiments that have been proposed by technology developers but not necessarily selected for flight. Experiments to be flown in space will be selected through an Announcement of Opportunity (A.O.) process. The A.O. is expected to be released in August, 1992. Experiments will generally fall into one of the 3 following categories: (1) Individual technology experiments; (2) Instrumented Space Station; and (3) Guest investigator program. The individual technology experiments are those that do not instrument the Space Station nor directly relate to the development of technologies for evolution of Space Station or development of advanced space platforms. The Instrumented Space Station category is similar to the Orbiter Experiments Program and allows the technology developer to instrument subsystems on the Station or develop instrumentation packages that measure products or processes of the Space Station for the advancement of space platform technologies. The guest investigator program allows the user to request data from Space Station or other experiments for independent research. When developing an experiment, a developer should consider all the resources and infrastructure that Space Station Freedom can provide and take advantage of these to the maximum extent possible. Things like environment, accommodations, carriers, and integration should all be taken into account. In developing experiments at Langley Research Center, an iterative approach is proving useful. This approach uses Space Station utilization and subsystem experts to advise and critique experiment designs to take advantage of everything the Space Station has to offer. Also, solid object modeling and animation computer tools are used to fully visualize the experiment and its processes. This process is very useful for attached payloads and allows problems to be detected early in the experiment design phase. Author

MODAL IDENTIFICATION EXPERIMENT

Raymond G. Kvaternik *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 349-362 (For primary document see N93-22606 08-18)

Avail: CASI HC A03/MF A04

The Modal Identification Experiment (MIE) is a proposed on-orbit experiment being developed by NASA's Office of Aeronautics and Space Technology wherein a series of vibration measurements would be made on various configurations of Space Station Freedom (SSF) during its on-orbit assembly phase. The experiment is to be conducted in conjunction with station reboost operations and consists of measuring the dynamic responses of the spacecraft produced by station-based attitude control system and reboost thrusters, recording and transmitting the data, and processing the data on the ground to identify the natural frequencies, damping factors, and shapes of significant vibratory modes. The experiment would likely be a part of the Space Station on-orbit verification. Basic research objectives of MIE are to evaluate and improve methods for analytically modeling large space structures, to develop techniques for performing in-space modal testing, and to validate candidate techniques for in-space modal identification. From an engineering point of view, MIE will provide the first opportunity to obtain vibration data for the fully-assembled structure because SSF is too large and too flexible to be tested as a single unit on the ground. Such full-system data is essential for validating the analytical model of SSF which would be used in any engineering efforts associated with structural or control system changes that might be made to the station as missions evolve over time. Extensive analytical simulations of on-orbit tests, as well exploratory laboratory simulations using small-scale models, have been conducted in-house and under contract to develop a measurement plan and evaluate its potential performance. In particular, performance trade and parametric studies conducted as part of these simulations were used to resolve issues related to the number and location of the measurements, the type of excitation, data acquisition and data processing, effects of noise and nonlinearities, selection of target vibration modes, and the appropriate type of data analysis scheme. The purpose of this talk is to provide an executive-summary-type overview of the modal identification experiment which has emerged from the conceptual design studies conducted to-date. Emphasis throughout is on those aspects of the experiment which should be of interest to those attending the subject utilization conference. The presentation begins with some preparatory remarks to provide background and motivation for the experiment, describe

the experiment in general terms, and cite the specific technical objectives. This is followed by a summary of the major results of the conceptual design studies conducted to define the baseline experiment. The baseline experiment which has resulted from the studies is then described. Author

SELECTED OAST/OSSA SPACE EXPERIMENT ACTIVITIES IN SUPPORT OF SPACE STATION FREEDOM

Richard DeLombard *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 363-371 (For primary document see N93-22606 08-18)

Avail: CASI HC A02/MF A04

The Space Experiments Division at NASA Lewis Research Center is developing technology and science space experiments for the Office of Aeronautics and Space Technology (OAST) and the Office of Space Sciences and Applications (OSSA). Selected precursor experiments and technology development activities supporting the Space Station Freedom (SSF) are presented. The Tank Pressure Control Experiment (TPCE) is an OAST-funded cryogenic fluid dynamics experiment, the objective of which is to determine the effectiveness of jet mixing as a means of equilibrating fluid temperatures and controlling tank pressures, thereby permitting the design of lighter cryogenic tanks. The information from experiments such as this will be utilized in the design and operation of on board cryogenic storage for programs such as SSF. The Thermal Energy Storage Flight Project (TES) is an OAST-funded thermal management experiment involving phase change materials for thermal energy storage. The objective of this project is to develop and fly in-space experiments to characterize void shape and location in phase change materials used in a thermal energy storage configuration representative of an advanced solar dynamic system design. The information from experiments such as this will be utilized in the design of future solar dynamic power systems. The Solar Array Module Plasma Interaction Experiment (SAMPIE) is an OAST-funded experiment to determine the environmental effects of the low earth orbit (LEO) space plasma environment on state-of-the-art solar cell modules biased to high potentials relative to the plasma. Future spacecraft designs and structures will push the operating limits of solar cell arrays and other high voltage systems. SAMPIE will provide key information necessary for optimum module design and construction. The Vibration Isolation Technology (VIT) Advanced Technology Development effort is funded by OSSA to provide technology necessary to maintain a stable microgravity environment for sensitive payloads on board spacecraft. The proof of concept will be demonstrated by laboratory tests and in low-gravity aircraft flights. VIT is expected to be utilized by many SSF microgravity science payloads. The Space Acceleration Measurement System (SAMS) is an OSSA-funded instrument to measure the microgravity acceleration environment for OSSA payloads on the shuttle and SSF. Author

SPACECRAFT MATERIALS AND COATINGS EXPERIMENTS

Wayne S. Slemp *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 373-378 (For primary document see N93-22606 08-18)

Avail: CASI HC A01/MF A04

The 5.8-year exposure data from the Long Duration Experiment Facility (LDEF) has demonstrated the benefits of long-term exposure in low Earth orbit (LEO) for understanding the behavior of spacecraft materials and coatings for use in extended space missions. The Space Station Freedom represents the next large area spacecraft available in NASA planned missions for obtaining this long term space exposure data. The advantages of using the Space Station Freedom for these studies are presented. Discrepancies between short-term flight exposure result from Shuttle Orbiter experiments and the long-term LDEF results are shown. The major objectives and benefits of conducting materials and coatings experiments on Space Station Freedom are emphasized. Author

LONG DURATION SPACE MATERIALS EXPOSURE (LDSE)

David Allen and Robert Schmidt *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 379-393 (For primary document see N93-22606 08-18)

Avail: CASI HC A03/MF A04

The Center on Materials for Space Structures (CMSS) at Case Western Reserve University is one of seventeen Commercial Centers for the Development of Space. It was founded to: (1) produce and evaluate materials for space structures; (2) develop passive and active facilities for materials exposure and analysis in space; and (3) develop improved material systems for space structures. A major active facility for materials exposure is proposed to be mounted on the exterior truss of the Space Station Freedom (SSF). This Long Duration Space Materials Exposure (LDSE) experiment will be an approximately 6 1/2 ft. x 4 ft. panel facing into the velocity vector (RAM) to provide long term exposure (up to 30 years) to atomic oxygen, UV, micro meteorites, and other low earth orbit effects. It can expose large or small active (instrumented) or passive samples. These samples may be mounted in a removable Materials Flight Experiment (MFLEX) carrier which may be periodically brought into the SSF for examination by CMSS's other SSF facility, the Space Materials Evaluation Facility (SMEF), which will contain a Scanning Electron Microscope, a Variable Angle & Scanning Ellipsometer, a Fourier Transform Infrared Spectrometer, and other analysis equipment. These facilities will allow commercial firms to test their materials in space and promptly obtain information on their materials survivability in the LEO environment. Author

POTENTIAL PRESSURIZED PAYLOADS: FLUID AND THERMAL EXPERIMENTS

Theodore D. Swanson *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 395-406 (For primary document see N93-22606 08-18)

Avail: CASI HC A03/MF A04

Space Station Freedom (SSF) presents the opportunity to perform long term fluid and thermal experiments in a microgravity environment. This presentation provides perspective on the need for fluids/thermal experimentation in a microgravity environment, addresses previous efforts, identifies possible experiments, and discusses the capabilities of a proposed fluid physics/dynamics test facility. Numerous spacecraft systems use fluids for their operation. Thermal control, propulsion, waste management, and various operational processes are examples of such systems. However, effective ground testing is very difficult. This is because the effect of gravity induced phenomena, such as hydrostatic pressure, buoyant convection, and stratification, overcome such forces as surface tension, diffusion, electric potential, etc., which normally dominate in a microgravity environment. Hence, space experimentation is necessary to develop and validate a new fluid based technology. Two broad types of experiments may be performed on SSF: basic research and applied research. Basic research might include experiments focusing on capillary phenomena (with or without thermal and/or solutal gradients), thermal/solutal convection, phase transitions, and multiphase flow. Representative examples of applied research might include two-phase pressure drop, two-phase flow instabilities, heat transfer coefficients, fluid tank fill/drain, tank slosh dynamics, condensate removal enhancement, and void formation within thermal energy storage materials. In order to better support such fluid/thermal experiments on board SSF, OSSA has developed a conceptual design for a proposed Fluid Physics/Dynamics Facility (FP/DF). The proposed facility consists of one facility rack permanently located on SSF and one experimenter rack which is changed out as needed to support specific experiments. This approach will minimize the on-board integration/deintegration required for specific experiments. The FP/DF will have acceleration/vibration compensation, power and thermal interfaces, computer command/data collection, a video imaging system, and a portable glove box for operations. This facility will allow real-time astronaut interaction with the testing.

ZERO-G LIFE SUPPORT FOR SPACE STATION FREEDOM **c54**

Matthew Kolodney (Lockheed Engineering and Sciences Co., Houston, TX.) and L. Dall-Bauman *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 407-414 (For primary document see

N93-22606 08-18)
Avail: CASI HC A02/MF A04

Optimal design of spacecraft environmental control and life support systems (ECLSS) for long duration missions requires an understanding of microgravity and its long-term influence on ECLSS performance characteristics. This understanding will require examination of the fundamental processes associated with air revitalization and water recovery in a microgravity environment. Short term testing can be performed on NASA's reduced gravity aircraft (a KC-135), but longer tests will need to be conducted on the shuttle or Space Station Freedom. Conceptual designs have been prepared for ECLSS test beds that will allow extended testing of equipment under microgravity conditions. Separate designs have been formulated for air revitalization and water recovery test beds. In order to allow testing of a variety of hardware with minimal alteration of the beds themselves, the designs include storage tanks, plumbing, and limited instrumentation that would be expected to be common to all air (or water) treatment equipment of interest. In the interest of minimizing spacecraft/test bed interface requirements, the beds are designed to recycle process fluids to the greatest extent possible. In most cases, only cooling water and power interfaces are required. A volume equal to that of two SSF lockers was allowed for each design. These bed dimensions would limit testing to equipment with a 0.5- to 1.5-person-equivalent throughput. The mass, volume, and power requirements for the air revitalization test bed are estimated at 125-280 kg, 1.0- 1.4 cubic meters, and 170 min 1070 W. Corresponding ranges for the water recovery test bed are 325-375 kg, 1.0-1.1 cubic meters, and 350-850 W. These figures include individual test articles and accompanying hardware as well as the tanks, plumbing, and instrumentation included in the bed designs. Process fluid weight (i.e., water weight) is also included. Author

WP-2 ATTACHED PAYLOAD ACCOMMODATIONS

Jim Scheib *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 415-424 (For primary document see N93-22606 08-18)
Avail: CASI HC A02/MF A04

The presentation provides an overview of the current SSFP attached payload accommodations on the U.S. truss. The overview includes discussions on the four attach sites, the power architecture, thermal control, DMS provisions, and the mechanical attach mechanism. The presentation concludes with a description of a McDonnell Douglas concept for an attached payload pallet designed to take advantage of the four sites and existing SSF hardware. This presentation should provide the payload community with a basic understanding of the SSF attached payload utility ports and aid in attached payload concept development. Author

RESEARCH OBJECTIVES, OPPORTUNITIES, AND FACILITIES FOR MICROGRAVITY SCIENCE c29

Robert J. Bayuzick *In its* Space Station Freedom Utilization Conference 1992 p 427-462 Prepared in cooperation with Vanderbilt Univ., Nashville, TN (For primary document see N93-22606 08-18)
Avail: CASI HC A03/MF A04

Microgravity Science in the U.S.A. involves research in fluids science, combustion science, materials science, biotechnology, and fundamental physics. The purpose is to achieve a thorough understanding of the effects of gravitational body forces on physical phenomena relevant to those disciplines. This includes the study of phenomena which are usually overwhelmed by the presence of gravitational body forces and, therefore, chiefly manifested when gravitational forces are weak. In the pragmatic sense, the research involves gravity level as an experimental parameter. Calendar year 1992 is a landmark year for research opportunities in low earth orbit for Microgravity Science. For the first time ever, three Spacelab flights will fly in a single year: IML-1 was launched on January 22; USML-1 was launched on June 25; and, in September, SL-J will be launched. A separate flight involving two cargo bay carriers, USMP-1, will be launched in October. From the beginning of 1993 up to and including the Space Station era (1997), nine flights involving either Spacelab or USMP carriers will be flown. This will be augmented by a number of middeck payloads and get away specials flying on various flights. All of this activity sets the stage for experimentation on Space Station Freedom. Beginning in 1997, experiments in Microgravity Science will be conducted on the Space Station. Facilities for doing experiments in protein crystal growth, solidification, and biotechnology will all be available. These will be joined by middeck-class payloads and the microgravity glove box for conducting additional experiments. In 1998, a new generation protein crystal growth facility and a facility for conducting combustion research will arrive. A fluids science facility and additional capability for conducting research in solidification, as well as an ability to handle small payloads on a quick response basis, will be added in 1999. The year 2000 will see upgrades in the protein crystal growth and fluids science facilities. From the beginning of 1997 to the fall of 1999 (the 'man-tended capability' era), there will be two or three utilization flights per year. Plans call for operations in Microgravity Science during utilization flights and between utilization flights. Experiments conducted during utilization flights will characteristically require crew interaction, short duration, and less sensitivity to perturbations in the acceleration environment. Operations between utilization flights will involve experiments that can be controlled remotely and/or can be automated. Typically, the experiments will require long times and a pristine environment. Beyond the fall of 1999 (the 'permanently-manned capability' era), some payloads will require crew interaction; others will be automated and will make use of telescience.

SPACE STATION FREEDOM COMBUSTION RESEARCH c29

G. M. Faeth *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 463-474 (For primary document see N93-22606 08-18)
Avail: CASI HC A03/MF A04

Extended operations in microgravity, on board spacecraft like Space Station Freedom, provide both unusual opportunities and unusual challenges for combustion science. On the one hand, eliminating the intrusion of buoyancy provides a valuable new perspective for fundamental studies of combustion phenomena. On the other hand, however, the absence of buoyancy creates new hazards of fires and explosions that must be understood to assure safe manned space activities. These considerations - and the relevance of combustion science to problems of pollutants, energy utilization, waste incineration, power and propulsion systems, and fire and explosion hazards, among others - provide strong motivation for microgravity combustion research. The intrusion of buoyancy is a greater impediment to fundamental combustion studies than to most other areas of science. Combustion intrinsically heats gases with the resulting buoyant motion at normal gravity either preventing or vastly complicating measurements. Perversely, this limitation is most evident for fundamental laboratory experiments; few practical combustion phenomena are significantly affected by buoyancy. Thus, we have never observed the most fundamental combustion phenomena - laminar premixed and diffusion flames, heterogeneous flames of particles and surfaces, low-speed turbulent flames, etc. - without substantial buoyant disturbances. This precludes rational merging of theory, where buoyancy is of little interest, and experiments, that always are contaminated by buoyancy, which is the traditional path for developing most areas of science. The current microgravity combustion program seeks to rectify this deficiency using both ground-based and space-based facilities, with experiments involving space-based facilities including: laminar premixed flames, soot processes in laminar jet diffusion flames, structure of laminar and turbulent jet diffusion flames, solid surface combustion, one-dimensional smoldering, ignition and flame spread of liquids, drop combustion, and quenching of panicle-air flames. Unfortunately, the same features that make microgravity attractive for fundamental combustion experiments, introduce new fire and explosion hazards that have no counterpart on earth. For example, microgravity can cause broader flammability limits, novel regimes of flame spread, enhanced effects of flame radiation, slower fire detector response, and enhanced combustion upon injecting fire extinguishing agents, among others. On the other hand, spacecraft provide an opportunity to use 'fire-safe' atmospheres due to their controlled environment. Investigation of these problems is just beginning, with specific fire safety experiments supplementing the space based fundamental experiments listed earlier; thus, much remains to be done to develop an adequate technology base for fire and explosion safety considerations for spacecraft. MICROGRAVITY FLUID PHYSICS RESEARCH IN THE SPACE STATION FREEDOM ERA **c29**

Bradley M. Carpenter *In its* Space Station Freedom Utilization Conference 1992 p 475-479 (For primary document see N93-22606 08-18)

Avail: CASI HC A01/MF A04

Microgravity fluid physics covers an exciting range of established and potential fields of scientific research. Areas in which the Microgravity Science and Applications Division of NASA's Office of Space Science and Applications is currently supporting research include: multiphase flow and phase change heat transfer, behavior of granular media and colloids; and interface dynamics, morphological stability, and contact line phenomena. As they contribute to our knowledge of fluid behavior, advances in these areas will enhance our understanding of materials processing on Earth and in space, and will contribute to technologies as diverse as chemical extraction, the prediction of soil behavior in earthquakes, and the production of oil reservoirs. NASA' s primary platform for research in microgravity fluid physics will soon be the Fluid Physics/Dynamics Facility on Space Station Freedom. This facility shares a rack for control and utilities with the Modular Combustion Facility, and has one rack for experiment-unique instruments. It is planned to change out the content of the experiment-unique rack at intervals on the order of one year. In order to obtain a maximum return on the operation of the facility during these intervals, the research community must carefully plan and coordinate an effort that brings the efforts of many investigators to bear on problems of particular importance. NASA is currently working with the community to identify research areas in which microgravity can make a unique and valuable contribution, and to build a balanced program of research around these areas or thrusts. Selections will soon be made from our first solicitation for research in fluid dynamics and transport phenomena. These solicitations will build the research community that will make Space Station Freedom a catalyst for scientific and technological discovery, and offer U.S. scientists in many disciplines a unique opportunity to participate in space science.

MATERIALS SCIENCE RESEARCH IN MICROGRAVITY **c29**

John H. Perepezko *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 481-500 (For primary document see N93-22606 08-18)

Avail: CASI HC A03/MF A04

There are several important attributes of an extended duration microgravity environment that offer a new dimension in the control of the microstructure, processing, and properties of materials. First, when gravitational effects are minimized, buoyancy driven convection flows are also minimized. The flows due to density differences, brought about either by composition or temperature gradients will then be reduced or eliminated to permit a more precise control of the temperature and the composition of a melt which is critical in achieving high quality crystal growth of electronic materials or alloy structures. Secondly, body force effects such as sedimentation, hydrostatic pressure, and deformation are similarly reduced. These effects may interfere with attempts to produce uniformly dispersed or aligned second phases during melt solidification. Thirdly, operating in a microgravity environment will facilitate the containerless processing of melts to eliminate the limitations of containment for reactive melts. The noncontacting forces such as those developed from electromagnet, electrostatic, or acoustic fields can be used to position samples. With this mode of operation, contamination can be minimized to enable the study of reactive melts and to eliminate extraneous crystal nucleation so that novel crystalline structures and new glass compositions may be produced. In order to take advantage of the microgravity environment for materials research, it has become clear that reliable processing models based on a sound ground based experimental experience and an established thermophysical property data base are essential. OFFICE OF COMMERCIAL PROGRAMS' RESEARCH ACTIVITIES FOR SPACE STATION FREEDOM UTILIZATION

James A. Fountain *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 511-530 (For primary document see N93-22606 08-18)

Avail: CASI HC A03/MF A04

One of the objectives of the Office of Commercial Programs (OCP) is to encourage, enable, and help implement space research which meets the needs of the U.S. industrial sector. This is done mainly through seventeen Centers for the Commercial Development of Space (CCDS's) which are located throughout the United States. The CCDS's are composed of members from U.S. companies, universities, and other government agencies. These Centers are presently engaged in industrial research in space using a variety of carriers to reach low Earth orbit. One of the goals is to produce a body of experience and knowledge that will allow U.S. industrial entities to make informed decisions regarding their participation in commercial space endeavors. A total of 32 items of payload hardware were built to date. These payloads have flown in space a total of 73 times. The carriers range from the KC-135 parabolic aircraft and expendable launch vehicles to the Space Shuttle. This range of carriers allows the experimenter to evolve payloads in complexity and cost by progressively extending the time in microgravity. They can start with a few seconds in the parabolic aircraft and go to several minutes on the rocket flights, before they progress to the complexities of manned flight on the Shuttle. Next year, two new capabilities will become available: COMET, an expendable-vehicle-launched experiment capsule that can carry experiments aloft for thirty days; and SPACEHAB, a new Shuttle borne module which will greatly add to the capability to accommodate small payloads. All of these commercial research activities and carrier capabilities are preparing the OCP to evolve those experiments that prove successful to Space Station Freedom. OCP and the CCDS's are actively involved in Space Station design and utilization planning and have proposed a set of experiments to be launched in 1996 and 1997. These experiments are to be conducted both internal and external to Space Station Freedom and will investigate industrial research topics which range from biotechnology to electronic materials to metallurgy. Some will be designed to make maximum use of the quiescent microgravity conditions in the 'ground-tended' phases during the early years of Space Station Freedom operations. Author (revised)

LARGE SCALE CRYSTALLIZATION OF PROTEIN PHARMACEUTICALS IN MICROGRAVITY VIA TEMPERATURE CHANGE **c29**

Marianna M. Long *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 531-552 (For primary document see N93-22606 08-18)

(Grant NAGw-813)

Avail: CASI HC A03/MF A04

The major objective of this research effort is the temperature driven growth of protein crystals in large batches in the microgravity environment of space. Pharmaceutical houses are developing protein products for patient care, for example, human insulin, human growth hormone, interferons, and tissue plasminogen activator or TPA, the clot buster for heart attack victims. Except for insulin, these are very high value products; they are extremely potent in small quantities and have a great value per gram of material. It is feasible that microgravity crystallization can be a cost recoverable, economically sound final processing step in their manufacture. Large scale protein crystal growth in microgravity has significant advantages from the basic science and the applied science standpoints. Crystal growth can proceed unhindered due to lack of surface effects. Dynamic control is possible and relatively easy. The method has the potential to yield large

quantities of pure crystalline product. Crystallization is a time honored procedure for purifying organic materials and microgravity crystallization could be the final step to remove trace impurities from high value protein pharmaceuticals. In addition, microgravity grown crystals could be the final formulation for those medicines that need to be administered in a timed release fashion. Long lasting insulin, insulin lente, is such a product. Also crystalline protein pharmaceuticals are more stable for long-term storage. Temperature, as the initiation step, has certain advantages. Again, dynamic control of the crystallization process is possible and easy. A temperature step is non-invasive and is the most subtle way to control protein solubility and therefore crystallization. Seeding is not necessary. Changes in protein and precipitant concentrations and pH are not necessary. Finally, this method represents a new way to crystallize proteins in space that takes advantage of the unique microgravity environment. The results from two flights showed that the hardware performed perfectly, many crystals were produced, and they were much larger than their ground grown controls. Morphometric analysis was done on over 4,000 crystals to establish crystal size, size distribution, and relative size. Space grown crystals were remarkably larger than their earth grown counterparts and crystal size was a function of PCF volume. That size distribution for the space grown crystals was a function of PCF volume may indicate that ultimate size was a function of temperature gradient. Since the insulin protein concentration was very low, 0.4 mg/ml, the size distribution could also be following the total amount of protein in each of the PCF's. X-ray analysis showed that the bigger space grown insulin crystals diffracted to higher resolution than their ground grown controls. When the data were normalized for size, they still indicated that the space crystals were better than the ground crystals. Author (revised)

COMMERCIAL OPPORTUNITIES IN BIOSEPARATIONS AND PHYSIOLOGICAL TESTING ABOARD SPACE STATION FREEDOM c51

W. C. Hymer *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 553-566 (For primary document see N93-22606 08-18)

Avail: CASI HC A03/MF A04

The Center for Cell Research (CCR) is a NASA Center for the Commercial Development of Space which has as its main goal encouraging industry-driven biomedical/biotechnology space projects. Space Station Freedom (SSF) will provide long duration, crew-tended microgravity environments which will enhance the opportunities for commercial biomedical/biotechnology projects in bioseparations and physiological testing. The CCR bioseparations program, known as USCEPS (for United States Commercial Electrophoresis Program in Space), is developing access for American industry to continuous-flow electrophoresis aboard SSF. In space, considerable scale-up of continuous free-flow electrophoresis is possible for cells, sub cellular particles, proteins, growth factors, and other biological products. The lack of sedemination and buoyancy-driven convection flow enhances purity of separations and the amount of material processed/time. Through the CCR's physiological testing program, commercial organizations will have access aboard SSF to physiological systems experiments (PSE's); the Penn State Biomodule; and telemicroscopy. Physiological systems experiments involve the use of live animals for pharmaceutical product testing and discovery research. The Penn State Biomodule is a computer-controlled mini lab useful for projects involving live cells or tissues and macro molecular assembly studies, including protein crystallization. Telemicroscopy will enable staff on Earth to manipulate and monitor microscopic specimens on SSF for product development and discovery research or for medical diagnosis of astronaut health problems. Space-based product processing, testing, development, and discovery research using USCEPS and CCR's physiological testing program offer new routes to improved health on Earth. Direct crew involvement-in biomedical/biotechnology projects aboard SSF will enable better experimental outcomes. The current data base shows that there is reason for considerable optimism regarding what the CCDS program and the biomedical/biotechnology industry can expect to gain from a permanent manned presence in space. CONSORTIUM FOR MATERIALS DEVELOPMENT IN SPACE INTERACTION WITH SPACE STATION FREEDOM c24

Charles A. Lundquist and Valerie Seaquist *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 567-573 (For primary document see N93-22606 08-18)

Avail: CASI HC A02/MF A04

The Consortium for Materials Development in Space (CMDS) is one of seventeen Centers for the Commercial Development of Space (CCDS) sponsored by the Office of Commercial Programs of NASA. The CMDS formed at the University of Alabama in Huntsville in the fall of 1985. The Consortium activities therefore will have progressed for over a decade by the time Space Station Freedom (SSF) begins operation. The topic to be addressed here is: what are the natural, mutually productive relationships between the CMDS and SSF? For management and planning purposes, the Consortium organizes its activities into a number of individual projects. Normally, each project has a team of personnel from industry, university, and often government organizations. This is true for both product-oriented materials projects and for infrastructure projects. For various projects Space Station offers specific mutually productive relationships. First, SSF can provide a site for commercial operations that have evolved as a natural stage in the life cycle of individual projects. Efficiency and associated cost control lead to another important option. With SSF in place, there is the possibility to leave major parts of processing equipment in SSF, and only bring materials to SSF to be processed and return to earth the treated materials. This saves the transportation costs of repeatedly carrying heavy equipment to orbit and back to the ground. Another generic feature of commercial viability can be the general need to accomplish large through-put or large scale operations. The size of SSF lends itself to such needs. Also in addition to processing equipment, some of the other infrastructure capabilities developed in CCDS projects may be applied on SSF to support product activities. The larger SSF program may derive mutual benefits from these infrastructure abilities. Author

MATERIALS DISPERSION AND BIODYNAMICS PROJECT RESEARCH c51

Marian L. Lewis *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 575-588 (For primary document see N93-22606 08-18)

Avail: CASI HC A03/MF A04

The Materials Dispersion and Biodynamics Project (MDBP) focuses on dispersion and mixing of various biological materials and the dynamics of cell-to-cell communication and intracellular molecular trafficking in microgravity. Research activities encompass biomedical applications, basic cell biology, biotechnology (products from cells), protein crystal development, ecological life support systems (involving algae and bacteria), drug delivery (microencapsulation), biofilm deposition by living organisms, and hardware development to support living cells on Space Station Freedom (SSF). Project goals are to expand the existing microgravity science database through experiments on sounding rockets, the Shuttle, and COMET program orbiters and to evolve,through current database acquisition and feasibility testing, to more mature and larger-scale commercial operations on SSF. Maximized utilization of SSF for these science applications will mean that service companies will have a role in providing equipment for use by a number of different customers. An example of a potential forerunner of such a service for SSF is the Materials Dispersion Apparatus (MDA) 'mini lab' of Instrumentation Technology Associates, Inc. (ITA) in use on the Shuttle for the Commercial MDAITA Experiments (CMIX) Project. The MDA wells provide the capability for a number of investigators to perform mixing and bioprocessing experiments in space. In the area of human adaptation to microgravity, a significant database has been obtained over the past three decades. Some low-g effects are similar to Earth-based disorders (anemia, osteoporosis, neuromuscular diseases, and immune system disorders). As new information targets potential profit-making processes, services and products from microgravity, commercial space ventures are expected to expand accordingly. Cooperative CCDS research in the above mentioned areas is essential for maturing SSF biotechnology and to ensure U.S. leadership in space technology. Currently, the MDBP conducts collaborative research with investigators at the Rockefeller University, National Cancer Institute, and the Universities of California, Arizona, and Alabama in Birmingham. The growing database from these collaborations provides fundamental information applicable to development of cell products,

manipulation of immune cell response, bone cell growth and mineralization, and other processes altered by low-gravity. Contacts with biotechnology and biopharmaceutical companies are being increased to reach uninformed potential SSF users, provide access through the CMDS to interested users for feasibility studies, and to continue active involvement of current participants. We encourage and actively seek participation of private sector companies, and university and government researchers interested in biopharmaceuticals, hardware development and fundamental research in microgravity. INTEGRATION AND USE OF MICROGRAVITY RESEARCH FACILITY: LESSONS LEARNED BY THE CRYSTALS BY VAPOR TRANSPORT EXPERIMENT AND SPACE EXPERIMENTS FACILITY PROGRAMS c29
Barbara L. Heizer *In* NASA, Washington, Space Station Freedom Utilization Conference 1992 p 589-600 (For primary document see N93-22606 08-18)
Avail: CASI HC A03/MF A04

The Crystals by Vapor Transport Experiment (CVTE) and Space Experiments Facility (SEF) are materials processing facilities designed and built for use on the Space Shuttle mid deck. The CVTE was built as a commercial facility owned by the Boeing Company. The SEF was built under contract to the UAH Center for Commercial Development of Space (CCDS). Both facilities include up to three furnaces capable of reaching 850 C minimum, stand-alone electronics and software, and independent cooling control. In addition, the CVTE includes a dedicated stowage locker for cameras, a laptop computer, and other ancillary equipment. Both systems are designed to fly in a Middeck Accommodations Rack (MAR), though the SEF is currently being integrated into a Spacehab rack. The CVTE hardware includes two transparent furnaces capable of achieving temperatures in the 850 to 870 C range. The transparent feature allows scientists/astronauts to directly observe and affect crystal growth both on the ground and in space. Cameras mounted to the rack provide photodocumentation of the crystal growth. The basic design of the furnace allows for modification to accommodate techniques other than vapor crystal growth. Early in the CVTE program, the decision was made to assign a principal scientist to develop the experiment plan, affect the hardware/software design, run the ground and flight research effort, and interface with the scientific community. The principal scientist is responsible to the program manager and is a critical member of the engineering development team. As a result of this decision, the hardware/experiment requirements were established in such a way as to balance the engineering and science demands on the equipment. Program schedules for hardware development, experiment definition and material selection, flight operations development and crew training, both ground support and astronauts, were all planned and carried out with the understanding that the success of the program science was as important as the hardware functionality. How the CVTE payload was designed and what it is capable of, the philosophy of including the scientists in design and operations decisions, and the lessons learned during the integration process are descussed. A COMPARISON OF THE SPACE STATION VERSION OF ASTROMAG WITH TWO FREE-FLYER VERSIONS
M. A. Green Jun. 1992 15 p Presented at the 1992 Space Cryogenics Workshop, Otobrum, Germany, 15-16 Jun. 1992
(Contract DE-AC03-76SF-00098)
(DE93-004695; LBL-32977; CONF-9206328-1) Avail: CASI HC A03/MF A01

The Space Station version of ASTROMAG is compared with free-flyer versions of ASTROMAG which could fly on an Atlas 2a rocket and a Delta rocket. Launch with either free-flyer imposes severe weight limits on the magnet and its cryogenic system. Both versions of ASTROMAG magnet which fly on free-flying satellites do not have to be charged more than once during the mission. This permits one to simplify the charging system and the cryogenic system. The helium 2 pump loop which supplies helium to the gas cooled electrical leads can be eliminated in both of the free-flyer versions of the ASTROMAG magnet. The superconducting dipole moment correction coils which are necessary for the magnet to operate on a free-flying satellite are described. DOE

P0004-1 QUICK LOOK Final Report
16 Oct. 1991 28 p
(Contract NAS8-38676)
(NASA-CR-192459; NAS 1.26:192459) Avail: CASI HC A03/MF A01

The P0004-1 'Seeds in Space' experiment consisted of six sealed aluminum canisters which contained tomato seeds and a variety of other seeds for the study of space radiation effects on the seeds. The seeds were contained in cloth bags. Interspersed among the bags of seeds were ten dosimeter packets to monitor the accumulated ionizing radiation exposure of the seeds. In addition to the ten flight dosimeter packets, four ground control packets and one ground movement packet were also included as part of the experiment. The P0004-1 experiment was mounted on the F2 tray, near the trailing edge of the LDEF orbiter. The results indicate that the neutron fluences were higher in the P0004 canisters than in that of P0006. The difference was much greater for thermal neutrons than resonance neutrons. This is consistent with shielding. Author

GROUP TASK FORCE ON SATELLITE RESCUE AND REPAIR Technical Report
29 Sep. 1992 40 p
(NASA-TM-108713; NAS 1.15:108713) Avail: CASI HC A03/MF A01

The Group Task Force was chartered by the Administrator of NASA to recommend 'a policy outlining the criteria, the design standards, and the pricing model to guide NASA in assessing the responsibilities for government and nongovernment Satellite Rescue and Repair Missions.' Criteria for accepting such missions, risks, and benefits to all sectors of our economy involved in satellite services, adequacy of planning and training, and the impact on NASA's primary mission were reviewed. The Group began by asking a more fundamental question; is satellite rescue and repair a logical element of NASA's mission? Factors considered were: (1) the probability of rescue or repair opportunities arising; (2) the economic justification for such attempts; (3) the benefits to NASA, both from such ad hoc learning experiences in space operations and the impact on the public perception of NASA; (4) the effect of such unanticipated missions on NASA's scheduled activities; (5) any potential effect on NASA's technical capability to work in space; and (6) any potential effect on U.S. economic competitiveness. IONOSPHERIC PLASMA FLOW ABOUT A SYSTEM OF ELECTRICALLY BIASED FLAT PLATES M.S. Thesis - Cleveland State Univ. Final Report

Joel L. Herr Apr. 1993 95 p

(Contract NAS3-25266; RTOP 506-41-52)

(NASA-CR-191119; E-7732; NAS 1.26:191119) Avail: CASI HC A05/MF A01

The steady state interaction of two electrically biased parallel plates immersed in a flowing plasma characteristic of low earth orbit is studied numerically. Fluid equations are developed to describe the motion of the cold positively charged plasma ions, and are solved using finite-differences in two dimensions on a Cartesian grid. The behavior of the plasma electrons is assumed to be described by the Maxwell-Boltzmann distribution. Results are compared to an analytical and a particle simulation technique for a simplified flow geometry consisting of a single semi-infinite negatively biased plate. Comparison of the extent of the electrical disturbance into the flowing plasma and the magnitude of the current collected by the plate is very good. The interaction of two equally biased parallel plates is studied as a function of applied potential. The separation distance at which the current collected by either plate decreases by five and twenty percent is determined as a function of applied potential. The percent decreases were based on a non-interacting case. The decrease in overall current is caused by a decrease in ionic density in the region between the plates. As the separation between the plates decreases, the plates collect the ions at a faster rate than they are supplied to the middle region by the oncoming plasma flow. The docking of spacecraft in orbit is simulated by moving two plates of unequal potential toward one another in a quasi-static manner. One plate is held at a large negative potential while the other floats electrically in the resulting potential field. It is found that the floating plate does not charge continuously negative as it approaches the other more negatively biased plate. Instead, it charges more and then less negative as ionic current decreases and then increases respectively upon approach. When the two plates come into contact, it is expected that the electrically floating plate will charge rapidly negative to a potential near that of the other plate. Author

ORBITER AUTOLAND RELIABILITY ANALYSIS

D. Phillip Welch Apr. 1993 390 p

(NASA-TM-4464; S-712; NAS 1.15:4464) Avail: CASI HC A17/MF A04

The Space Shuttle Orbiter is the only space reentry vehicle in which the crew is seated upright. This position presents some physiological effects requiring countermeasures to prevent a crewmember from becoming incapacitated. This also introduces a potential need for automated vehicle landing capability. Autoland is a primary procedure that was identified as a requirement for landing following and extended duration orbiter mission. This report documents the results of the reliability analysis performed on the hardware required for an automated landing. A reliability block diagram was used to evaluate system reliability. The analysis considers the manual and automated landing modes currently available on the Orbiter. (Autoland is presently a backup system only.) Results of this study indicate a +/- 36 percent probability of successfully extending a nominal mission to 30 days. Enough variations were evaluated to verify that the reliability could be altered with missions planning and procedures. If the crew is modeled as being fully capable after 30 days, the probability of a successful manual landing is comparable to that of Autoland because much of the hardware is used for both manual and automated landing modes. The analysis indicates that the reliability for the manual mode is limited by the hardware and depends greatly on crew capability. Crew capability for a successful landing after 30 days has not been determined yet. Author (revised)

GEOTAIL SPACECRAFT HISTORICAL DATA REPORT

George R. Boersig and Lawrence F. Kruse Mar. 1993 36 p

(NASA-TM-108710; NAS 1.15:108710; K-CM-HDR-D-212) Avail: CASI HC A03/MF A01

The purpose of this GEOTAIL Historical Report is to document ground processing operations information gathered on the GEOTAIL mission during processing activities at the Cape Canaveral Air Force Station (CCAFS). It is hoped that this report may aid management analysis, improve integration processing and forecasting of processing trends, and reduce real-time schedule changes. The GEOTAIL payload is the third Delta 2 Expendable Launch Vehicle (ELV) mission to document historical data. Comparisons of planned versus as-run schedule information are displayed. Information will generally fall into the following categories: (1) payload stay times (payload processing facility/hazardous processing facility/launch complex-17A); (2) payload processing times (planned, actual); (3) schedule delays; (4) integrated test times (experiments/launch vehicle); (5) unique customer support requirements; (6) modifications performed at facilities; (7) other appropriate information (Appendices A & B); and (8) lessons learned (reference Appendix C). Mar. 1993 128 p Original contains color illustrations

(NASA-TM-104764; S-714; NAS 1.15:104764) Avail: CASI HC A07/MF A02; 54 functional color pages

The utility of multiple-mesh targets as potential lightweight shields to protect spacecraft in low-Earth orbit against collisional damage is explored. Earlier studies revealed that single meshes comminute hypervelocity impactors with efficiencies comparable to contiguous targets. Multiple interaction of projectile fragments with any number of meshes should lead to increased comminution, deceleration, and dispersion of the projectile, such that all debris exiting the mesh stack possesses low specific energies (ergs/sq cm) that would readily be tolerated by many flight systems. The study is conceptually exploring the sensitivity of major variables such as impact velocity, the specific areal mass (g/sq cm) of the total mesh stack (SM), and the separation distance (S) between individual meshes. Most experiments employed five or ten meshes with total SM typically less than 0.5 the specific mass of the impactor, and silicate glass impactors rather than metal projectiles. While projectile comminution increases with increasing impact velocity due to progressively higher shock stresses, encounters with multiple-meshes at low velocity (1-2 km/s) already lead to significant disruption of the glass impactors, with the resulting fragments being additionally decelerated and dispersed by subsequent meshes, and, unlike most contiguous single-plate bumpers, leading to respectable performance at low velocity. Total specific bumper mass must be the subject of careful trade-off studies; relatively massive bumpers will generate too much debris being dislodged from the bumper itself, while exceptionally lightweight designs will not cause sufficient comminution, deceleration, or dispersion of the impactor. Separation distance was found to be a crucial design parameter, as it controls the dispersion of the fragment cloud. Substantial mass savings could result if maximum separation distances were employed. The total mass of debris dislodged by multiple-mesh stacks is modestly smaller than that of single, contiguous-membrane shields. The cumulative surface area of all penetration holes in multiple mesh stacks is an order of magnitude smaller than that in analog multiple-foil shields, suggesting good long-term performance of the mesh designs. Due to different experimental conditions, direct and quantitative comparison with other lightweight shields is not possible at present. Author (revised)

NONLINEAR ATTITUDE CONTROL OF SPACECRAFT AND MOMENTUM MANAGEMENT OF CONTROL MOMENT GYROS Ph.D. Thesis
Hwa-Suk Oh 1992 115 p
Avail: Univ. Microfilms Order No. DA9300490

Nonlinear design procedures are presented for obtaining attitude control and momentum management laws. These are based on the Liapunov stability theorems. The Work-Energy Rate (WER) principle is extended to cover general classes of systems. It is shown that the use of the WER principle for obtaining control laws, can reduce the design efforts. The attitude control laws are designed for several types of missions, i.e., absolute attitude and relative attitude control. The momentum management as well as attitude control laws are designed for both stable and unstable spacecraft configurations which use Control Moment Gyros (CMGs) as active actuators. A large stability region is found around the local-vertical-local-horizontal (LVLH) equilibrium point, and so the designed control laws can be used even in the event of large initial attitude deviations for LVLH. In the presence of constant disturbance, the momentum is managed by seeking a Torque Equilibrium Attitude (TEA) where the disturbance torque is balanced by gravity gradient and gyroscopic torques. This is done by the use of integral feedback of the control torque, which is related to the angular momentum of the CMGs. It is shown that the unknown constant disturbance can be identified by the use of integral feedback. Cyclic disturbance rejection for the pitch axis is performed by successive stabilization and integral feedback. Theoretical results developed are verified using both experimental and numerical simulations. Experimental model of a flexible spacecraft is used to demonstrate the applicability of the WER principle and the fact that under certain conditions, a control law based on a rigid body model, can be applied to a flexible spacecraft. Using a mathematical model of the Space Station Freedom, several attitude/momentum management control laws are simulated and shown to work successfully with/without a constant disturbance torque. The control law for cyclic disturbance rejection of pitch axis attitude is examined and found to work satisfactorily under the presence of cyclic disturbance. Dissert. Abstr.

PLASMA CHAMBER TESTING OF APSA COUPONS FOR THE SAMPIE FLIGHT EXPERIMENT
G. Barry Hillard Jan. 1993 9 p Presented at the 31st Aerospace Sciences Meeting and Exhibit, Reno, NV, 11-14 Jan. 1993; sponsored by the AIAA Previously announced in IAA as A93-24244
(RTOP 589-01-1B)
(NASA-TM-106084; E-7707; NAS 1.15:106084; AIAA Paper 93-0568)
Avail: CASI HC A02/MF A01

Among the solar cell technologies to be tested in space as part of the Solar Array Module Plasma Interactions Experiment (SAMPIE) will be the Advanced Photovoltaic Solar Array (APSA). Several prototype twelve cell coupons were built for NASA using different blanket materials and mounting techniques. The first conforms to the baseline design for APSA which calls for the cells to be mounted on a carbon loaded Kapton blanket to control charging in GEO. When deployed, this design has a flexible blanket supported around the edges. A second coupon was built with the cells mounted on Kapton-H, which was in turn cemented to a solid aluminum substrate. A final coupon was identical to the latter but used germanium coated Kapton to control atomic oxygen attack in LEO. Ground testing of these coupons in a plasma chamber showed considerable differences in plasma current collection. The Kapton-H coupon demonstrated current collection consistent with exposed interconnects and some degree of cell snapover. The other two coupons experienced anomalously large collection currents. This behavior is believed to a consequence of enhanced plasma sheaths supported by the weakly conducting carbon and germanium used in these coupons. The results reported here are the first experimental evidence that the use of such materials can result in power losses to high voltage space power systems. Author

MANEUVER AND VIBRATION CONTROL OF FLEXIBLE SPACE STRUCTURES BY LYAPUNOV STABILITY THEORY Ph.D. Thesis
Hyochoong Bang 1992 202 p
Avail: Univ. Microfilms Order No. DA9300392

This research is primarily aimed at developing control laws for maneuvers and vibration suppression of flexible space structures by using Lyapunov stability theory. The key point of the Lyapunov approach for flexible structure is to design stabilizing control laws by Lyapunov's second method without discretizing the partial differential equations modeling the original flexible systems into finite dimensional ordinary differential equations. The main analysis is focused on single axis slew maneuvers, for which both a constant gain feedback law and a near-minimum-time tracking control law are investigated. Also, results from ground-based experiments are reported which support the practical utility of the control laws. By optimization of the Lyapunov control laws, a strategy for selecting a best combination of feedback gains and shaping of the reference maneuver is suggested. The optimization is carried out with the admissible solutions constrained to satisfy the Lyapunov stability conditions. The objective is to find the stable solution which extremizes a prescribed closed loop performance optimality criterion. Optimization of the reference trajectory, in addition to feedback control gains, enables one to find an optimum reference motion which is parameterized through a shaping parameter which controls the sharpness of the switching in a near-band-band maneuver. As a performance objective for optimization, an index which measures the trade-off between residual energy and maneuver time is used. A generalization of the Lyapunov approach is introduced, which applies to hybrid coordinate discrete/distributed parameter systems. This generalization makes use of a novel hybrid version of Hamilton's canonical equations of the systems, which is an extension of the corresponding classical results for discrete coordinate systems. The rather general form of the resulting stable family of control laws is developed in terms of the Hamiltonian of a general class of nonlinear hybrid hybrid coordinate dynamical systems. As a further extension, nonlinear hybrid coordinate systems described by discrete quasi-coordinate systems such as three axis large angle maneuvers are included in designing stabilizing control laws. A different perspective on the Lyapunov approach is provided by introducing a work-energy rate principle for general hybrid coordinate systems. It turns out that, for multiple elastic domain systems, the boundary forces contribute to the control law design when a Lyapunov function is chosen to be a weighted combination of substructural kinetic and potential energy. The use of boundary forces is closely related to acceleration feedback, and this provides more design freedom for active vibration suppression for the associated control laws. Dissert. Abstr.

MINI-SATELLITE EXPLORATION OF VERY NEAR EARTH SPACE FUEL OBJECTS
19 Sep. 1992 8 p Presented at the 6th Annual American Inst. of Astronautics and Aeronautics/Utah State Univ. (AIAA/USU) Conference on Small Satellites, Logan, UT, 21-24 Sep. 1992
(Contract DE-AC07-76ID-01570)
(DE93-005253; EGG-M-92532; CONF-9209285-1) Avail: CASI HC A02/MF A01

A prospecting plan is presented to assay near Earth objects (NEO) for their potential to yield rocket fuel. The plan calls out small satellites as the near-term means to achieve low cost surveys and deep subsurface sampling of NEO composition. The water bearing classes of NEO to be considered are limited to those accessible in short time and with small thrusters. These include the water bearing clay objects (phylosilicates) at nearly trivial distances from Earth, and the recently identified water ice objects such as comet (#4015) 1979 VA. These objects are evaluated as small satellite prospecting and assay vehicle targets. DOE

This report presents the results of a study performed in support of the Space Station Freedom Advanced Development Program, under the sponsorship of the Space Station Engineering (Code MT), Office of Space Flight. The study consisted of the collection, compilation, and analysis of lessons learned, crew time requirements, and other factors influencing the application of advanced automation and robotics, with emphasis on potential improvements in productivity. The lessons learned data collected were based primarily on Skylab, Spacelab, and other Space Shuttle experiences, consisting principally of interviews with current and former crew members and other NASA personnel with relevant experience. The objectives of this report are to present a summary of this data and its analysis, and to present conclusions regarding promising areas for the application of advanced automation and robotics technology to the Space Station Freedom and the potential benefits in terms of increased productivity. In this study, primary emphasis was placed on advanced automation technology because of its fairly extensive utilization within private industry including the aerospace sector. In contrast, other than the Remote Manipulator System (RMS), there has been relatively limited experience with advanced robotics technology applicable to the Space Station. This report should be used as a guide and is not intended to be used as a substitute for official Astronaut Office crew positions on specific issues. Author

ORBITING SPACE DEBRIS: DANGERS, MEASUREMENT AND MITIGATION Interim Report
Ross T. McNutt 1 Jun. 1992 238 p
(AD-A260533; AD-E201382; PL-TR-92-2146; ERP-1102) Avail: CASI HC A11/MF A03

Space debris is a growing environmental problem. Accumulation of objects in earth orbit threatens space systems through the possibility of collisions and runaway debris multiplication. The amount of debris in orbit is uncertain due to the lack of information on the population of debris between 1 and 10 centimeters diameter. Collisions with debris even smaller than 1 cm can be catastrophic due to the high orbital velocities involved. Research efforts are under way at NASA, United States Space Command and the Air Force Phillips Laboratory to detect and catalog the debris population in near-earth space. Current international and national laws are inadequate to control the proliferation of space debris. Space debris is a serious problem with large economic, military, technical and diplomatic components. Actions need to be taken now to: determine the full extent of the orbital debris problem; accurately predict the future evolution of the debris population; decide the extent of the debris mitigation procedures required; implement these policies on a global basis via an international treaty. Action must be initiated now, before the loss of critical space systems such as the space shuttle or the space station. GRA

The SOCRATES contamination model is described at length. The model allows for unsteady or steady simulation of contamination aboard a spacecraft via the direct simulation Monte Carlo method. The basis for the model is discussed, and sample calculations are given for an RCS engine firing at 320 kilometer altitude for three different orientations. These calculations are compared to visible data in the 6300 A region which is attributed to the forbidden transition between the O(1D) and O(3P) electronic states of atmospheric atomic oxygen. GRA

DESIGN MANUAL FOR TWO-PHASE COMPONENTS OF SPACECRAFT THERMAL MANAGEMENT SYSTEMS Final Report, May 1990 - Aug. 1992
Christopher J. Crowley, Michael G. Izenson, James J. Barry, Jerry L. Martin, and Rebecca S. Ent Sep. 1992 317 p
(Contract F04611-90-C-0004)
(AD-A260027; AD-E201325; TM-1524; PL-TR-92-3002) Avail: CASI HC A14/MF A03

This design manual presents methods to design and model the performance of key two-phase components in thermal management systems for spacecraft. Components for both capillary- and mechanically-pumped loops are modeled including: forced-convection evaporators; droplet evaporators; two-phase transport lines, fittings, and tees; shear condensers; capillary condensers; and mechanical pumps. Heat pipe condensers are also included. The methods can be used for component design and sizing, analysis of component performance in system or component development tests, development and evaluation of analytical models for key phenomena, and integration with transient codes for system analysis. This manual describes in detail the analysis methods which have been used to produce software for component design. The software and methods are validated against experimental data whenever such data are available. When possible, simple design maps are presented for initial scoping calculations for sizing two-phase components. The basic analytical approach for these design methods is mechanistic, so that the mathematical models for component behavior are based upon the fundamental physics. Thus, the methods include inherent scaling with gravity, physical size, and fluid properties. This approach allows the models to be easily upgraded as new experimental data become available and includes the ability to assess the analytical uncertainty in design calculations. GRA

REUSABLE REENTRY SATELLITE SYSTEM SPECIFICATION. VOLUME 1-9 (Diskette Supplement)
8 Feb. 1990 191 p Diskette supplement: 2 IBM compatible 3.5-inch DSDD
(Contract NAS9-18202)
(NASA-CR-192969; NAS 1.26:192969; RRS-015;
NONP-Suppl-DK-93-159792) Avail: Issuing Activity (Center for Aerospace Information) HC/DK A14

The Reusable Reentry Satellite system is composed of the Payload Module (PM), the Reusable Reentry Vehicle (RRV), and the Launch and Mission Support (LMS) segments. The nine volumes that comprise this system specification establish the performance, design, development, and test requirements for the Reusable Reentry Satellite (RRS) system. Included in this system specification are two 3.5 in. diskettes that contain the following: RRS midterm specifications; and RRS figures and tables.

SPACE GENERIC OPEN AVIONICS ARCHITECTURE (SGOAA) STANDARD SPECIFICATION
Richard B. Wray and John R. Stovall Mar. 1993 59 p Revised Supersedes LESC-30354
(Contract NAS9-17900)
(NASA-CR-188245; NAS 1.26:188245; LESC-30354-A) Avail: CASI HC A04/MF A01

The purpose of this standard is to provide an umbrella set of requirements for applying the generic architecture interface model to the design of a specific avionics hardware/software system. This standard defines a generic set of system interface points to facilitate identification of critical interfaces and establishes the requirements for applying appropriate low level detailed implementation standards to those interface points. The generic core avionics system and processing architecture models provided herein are robustly tailorable to specific system applications and provide a platform upon which the interface model is to be applied. A Preliminary Safety Analysis (PSA) is being accomplished as part of the Space Station Furnace Facility (SSFF) contract. This analysis is intended to support SSFF activities by analyzing concepts and designs as they mature to develop essential safety requirements for inclusion in the appropriate specifications, and designs, as early as possible. In addition, the analysis identifies significant safety concerns that may warrant specific trade studies or design definition, etc. The analysis activity to date concentrated on hazard and hazard cause identification and requirements development with the goal of developing a baseline set of detailed requirements to support trade study, specifications development, and preliminary design activities. The analysis activity will continue as the design and concepts mature. Section 2 defines what was analyzed, but it is likely that the SSFF definitions will undergo further changes. The safety analysis activity will reflect these changes as they occur. The analysis provides the foundation for later safety activities. The hazards identified will in most cases have Preliminary Design Review (PDR) applicability. The requirements and recommendations developed for each hazard will be tracked to ensure proper and early resolution of safety concerns. Author

The Space Station Freedom Furnace (SSFF) Study was awarded on June 2, 1989, to Teledyne Brown Engineering (TBE) to define an advanced facility for materials research in the microgravity environment of Space Station Freedom (SSF). The SSFF will be designed for research in the solidification of metals and alloys, the crystal growth of electronic and electro-optical materials, and research in glasses and ceramics. The SSFF is one of the first 'facility' class payloads planned by the Microgravity Science and Applications Division (MSAD) of the Office of Space Science and Applications of NASA Headquarters. This facility is planned for early deployment during man-tended operations of the SSF with continuing operations through the Permanently Manned Configuration (PMC). The SSFF will be built around a general 'Core' facility which provides common support functions not provided by SSF, common subsystems which are best centralized, and common subsystems which are best distributed with each experiment module. The intent of the facility approach is to reduce the overall cost associated with implementing and operating a variety of experiments. This is achieved by reducing the launch mass and simplifying the hardware development and qualification processes associated with each experiment. The Core will remain on orbit and will require only periodic maintenance and upgrading while new Furnace Modules, samples, and consumables are developed, qualified, and transported to the SSF. The SSFF Study was divided into two phases: phase 1, a definition study phase, and phase 2, a design and development phase. The definition phase 1 is addressed. Phase 1 was divided into two parts. In the first part, the basic part of the effort, covered the preliminary definition and assessment of requirements; conceptual design of the SSFF; fabrication of mockups; and the preparation for and support of the Conceptual Design Review (CoDR). The second part, the option part, covered requirements update and documentation; refinement of the selected conceptual design through additional trades and analyses; design, fabrication, and test of the Development Model; and design, fabrication, and test of the Interrack Demonstration Unit; and support of the requirements definition review (RDR). The purpose of part 2 was to prove concept feasibility. Author (revised)

N93-23237*# Teledyne Brown Engineering, Huntsville, AL. Space Programs Div.
SPACE STATION FURNACE FACILITY. VOLUME 3: PROGRAM COST ESTIMATE
May 1992 176 p
(Contract NAS8-38077)
(NASA-CR-192478; NAS 1.26:192478) Avail: CASI HC A09/MF A02

The approach used to estimate costs for the Space Station Furnace Facility (SSFF) is based on a computer program developed internally at Teledyne Brown Engineering (TBE). The program produces time-phased estimates of cost elements for each hardware component, based on experience with similar components. Engineering estimates of the degree of similarity or difference between the current project and the historical data is then used to adjust the computer-produced cost estimate and to fit it to the current project Work Breakdown Structure (WBS). The SSFF Concept as presented at the Requirements Definition Review (RDR) was used as the base configuration for the cost estimate. This program incorporates data on costs of previous projects and the allocation of those costs to the components of one of three, time-phased, generic WBS's. Input consists of a list of similar components for which cost data exist, number of interfaces with their type and complexity, identification of the extent to which previous designs are applicable, and programmatic data concerning schedules and miscellaneous data (travel, off-site assignments). Output is program cost in labor hours and material dollars, for each component, broken down by generic WBS task and program schedule phase. Derived from text

(NASA-CR-192472; NAS 1.26:192472) Avail: CASI HC A04/MF A01; 2 functional color pages

The Space Station Freedom Furnace (SSFF) Project is divided into two phases: phase 1, a definition study phase, and phase 2, a design and development phase. TBE was awarded a research study entitled, 'Space Station Furnace Facility Requirements Definition and Conceptual Design Study' on June 2, 1989. This report addresses the definition study phase only. Phase 2 is to be complete after completion of phase 1. The contract encompassed a requirements definition study and culminated in hardware/facility conceptual designs and hardware demonstration development models to test these conceptual designs. The study was divided into two parts. Part 1 (the basic part of the effort) encompassed preliminary requirements definition and assessment; conceptional design of the SSFF Core; fabrication of mockups; and preparation for the support of a conceptional design review (CoDR). Part 2 (the optional part of the effort) included detailed definition of the engineering and design requirements, as derived from the science requirements; refinement of the conceptual design of the SSFF Core; fabrication and testing of the 'breadboards' or development models; and preparation for and support of a requirements definition review. Derived from text

SPACE STATION FURNACE FACILITY. EXPERIMENT/FACILITY REQUIREMENTS DOCUMENT (E/FRD), VOLUME 2, APPENDIX 5 Final Report
Nancy Kephart May 1992 354 p Original contains color illustrations
(Contract NAS8-38077)
(NASA-CR-192476; NAS 1.26:192476; Rept-320REQ0007-Vol-2-App-5)
Avail: CASI HC A16/MF A03; 2 functional color pages

The function of the Space Station Furnace Facility (SSFF) is to support materials research into the crystal growth and solidification processes of electronic and photonic materials, metals and alloys, and glasses and ceramics. To support this broad base of research requirements, the SSFF will employ a variety of furnace modules operated, regulated, and supported by a core of common subsystems. Furnace modules may be reconfigured or specifically developed to provide unique solidifcation conditions for each set of experiments. The SSFF modular approach permits the addition of new or scaled-up furnace modules to support the evolution of the facility as new science requirements are identified. The SSFF Core is of modular design to permit augmentation for enhanced capabilities. The fully integrated configuration of the SSFF will consist of three racks with the capability of supporting up to two furnace modules per rack. The initial configuration of the SSFF will consist of two of the three racks and one furnace module. This Experiment/Facility Requirements Document (E/FRD) describes the integrated facility requirements for the Space Station Freedom (SSF) Integrated Configuration-1 (IC1) mission. The IC1 SSFF will consist of two racks: the Core Rack, with the centralized subsystem equipment, and the Experiment Rack-1, with Furnace Module-1 and the distributed subsystem equipment to support the furnace. ESA ERS 1 PRODUCT SPECIFICATION
Pam Vass, ed. and Bruce Battrick, ed. Jun. 1992 71 p Original contains color illustrations
(ESA-SP-1149; ISBN-92-9092-033-5; ETN-93-93498) Copyright Avail: CASI HC A04/MF A01; ESA, EPD, ESTEC, Noorwijk, Netherlands, HC

Information relevant to the description of the product generated from the data telemetered by the ERS-1 payload instruments at ESA facilties (ground stations or processing and archiving facilities) is presented. ERS-1 is the first European remote sensing satellite launched by ESA on 17 Jul. 1991, and in the three years of its expected lifetime will provide systematic coverage of ocean and sea ice areas on a highly repetitive basis allowing global monitoring for meteorological and environmental applications. Much of the data will be collected from remote areas such as the polar regions and the southern oceans, for which little comparable information has previously been collected. The nature of the satellite's orbit and its complement of sensors enables a global mission providing worldwide geographical and repetitive coverage, primarily oriented towards ocean and ice monitoring. An all weather high resolution microwave imaging capability is also available over land and coastal zones within the regional coverage of a ground receiving station. The ERS-1 space segment, ground segment,

and user access to products and services are introduced. Summaries of characteristics and available product specifications are given for the following instruments: Synthetetic Aperture Radar (SAR) image mode, SAR wave mode, wind scatterometer, and radio altimeter. Details of the orbit and gravity field models are given. ESA

SUMS EXPERIMENT FLIGHT RESULTS ON STS-35
Robert C. Blanchard, Thomas A. Ozoroski (Vigyan Research Associates, Inc., Hampton, VA.), and John Y. Nicholson (Vigyan Research Associates, Inc., Hampton, VA.) Apr. 1993 33 p Original contains color illustrations
(RTOP 506-48-11-03)
(NASA-TM-107738; NAS 1.15:107738) Avail: CASI HC A03/MF A01; 2 functional color pages

Calibrated pressure measurements for species with mass to charge ratios up to 50 amu/e(-) were obtained from the Shuttle Upper Atmosphere Mass Spectrometer (SUMS) experiment during reentry on the STS-35 mission. Data were collected from 180 km, when the signal rose above the background, to about 87 km, when the SUMS system automatically closed the gas inlet value. However, data above 115 km was contaminated from a source of gas emanating from pressure transducers connected in parallel to the mass spectrometer. At lower altitudes, the pressure transducer data is compared with the mass spectrometer total pressure with excellent agreement. The free-stream density in the rarefied flow flight regime is calculated using an orifice pressure coefficient model based upon direct simulation Monte Carlo results. This density, when compared with the 1976 U.S. standard atmosphere model, exhibits the wave-like nature seen on previous flights using accelerometry. In addition, selected spectra are presented at higher altitudes (320 km) showing the effects of the ingestion of gases from a forward fuselage fuel dump. An analysis of the spectra data from this event is presented to show that no significant permanent changes occurred which affected the data interpretation at lower altitudes. Further, the localized chemistry from the individual species during the onset of aerodynamic heating is examined to the extent possible for a closed source system, such as SUMS. Near the orifice entrance, a significant amount of CO2 was generated from chemical reactions with the carbon panels of the Orbiter and absorbed oxygen on the system tubing.

PROPOSED GROUND-BASED CONTROL OF ACCELEROMETER ON SPACE STATION FREEDOM
Richard DeLombard May 1993 15 p Proposed for presentation at the 39th International Instrumentation Symposium, Albuquerque, NM, 2-6 May 1993; sponsored by the Instrument Society of America Original contains color illustrations
(RTOP 694-03-0H)
(NASA-TM-105960; E-7478; NAS 1.15:105960) Avail: CASI HC A03/MF A01; 1 functional color page

This paper describes the innovative control of an accelerometer to support the needs of the scientists operating science experiments that are on-board Space Station Freedom (SSF). Accelerometers in support of science experiments on the shuttle have typically been passive, record-only devices that present data only after the mission or that present limited data to the crew or ground operators during the mission. With the advent of science experiment operations on SSF, the principal investigators will need microgravity acceleration data during, as well as after, experiment operations. Because their data requirements may change during the experiment operations, the principal investigators will be allocated some control of accelerometer parameters. This paper summarizes the general-purpose Space Acceleration Measurement System (SAMS) operation that supports experiments on the shuttle and describes the control of the SAMS for Space Station Freedom. Emphasis is placed on the proposed ground-based control of the accelerometer by the principal investigators.

The Langmuir Probe/Electric Field Experiment was designed, built, and flown on the CRRES satellite to obtain high quality measurements of plasma density, electric fields, and waves in the inner magnetosphere. A data reduction and display program was written and initial results were reported. The spacecraft failed after more than one year of successful data collection. GRA

(NASA-CR-192454; NAS 1.26:192454; RTN-218-01; RTN-218-03; RTN-218-04; RTN-250-6-01) Avail: CASI HC A08/MF A02

A preliminary analysis of National Launch System ascent plume induced base heating environments has been completed to support the Induced Environments Panel's objective to assist in maturing the NLS vehicle (1.5 stage and heavy launch lift vehicle) design. Environments during ascent have been determined from this analysis for a few selected locations on the engine nozzles and base heat shield for both vehicles. The environments reflect early summer 1991 configurations and performance data and conservative methodology. A more complete and thorough analysis is under way to update these environments for the cycle 1 review in January 1992. Author

DEVELOPMENT OF A MINIATURE MASS ANALYZER AND ASSOCIATED INSTRUMENTATION FOR IMPROVED CAPABILITIES IN THE ANALYSIS OF LOW ENERGY PLASMAS FROM A ROCKET OR SATELLITE PLATFORM Final Technical Report, 12 Dec. 1988 - 31 May 1992
John H. Hoffman 20 Jul. 1992 4 p
(Contract NAS8-37582)
(NASA-CR-192453; NAS 1.26:192453) Avail: CASI HC A01/MF A01

The University of Texas at Dallas (UTD) Center for Space Sciences (CSS) has designed, developed, and fabricated three miniature mass spectrometers and their associated instrumentation in fulfillment of a NASA contract. The ion mass spectrometer analyzers furnished under this contract were modeled after a unit developed during a previous NASA grant. Three assemblies are described: (1) the magnetic sector; (2) the ion detector; and (3) the amplifier and power supply. Derived from text

BASE HEATING METHODOLOGY IMPROVEMENTS, VOLUME 1 Final Report, Sep. 1989 - Nov. 1992
Robert L. Bender, John E. Reardon, Richard E. Somers, Michael S. Fulton, Sheldon D. Smith (SECA, Inc., Huntsville, AL.), and Harold Pergament (Propulsion Science and Technology, Inc., Princeton, NJ.) Nov. 1992 112 p
(Contract NAS8-38141)
(NASA-CR-192455; NAS 1.26:192455; RTR-218-01-Vol-1) Avail: CASI HC A06/MF A02

This document is the final report for NASA MSFC Contract NAS8-38141. The contracted effort had the broad objective of improving the launch vehicles ascent base heating methodology to improve and simplify the determination of that environment for Advanced Launch System (ALS) concepts. It was pursued as an Advanced Development Plan (ADP) for the Joint DoD/NASA ALS program office with project management assigned to NASA/MSFC. The original study was to be completed in 26 months beginning Sep. 1989. Because of several program changes and emphasis on evolving launch vehicle concepts, the period of performance was extended to the current completion date of Nov. 1992. A computer code incorporating the methodology improvements into a quick prediction tool was developed and is operational for basic configuration and propulsion concepts. The code and its users guide are also provided as part of the contract documentation. Background information describing the specific objectives, limitations, and goals of the contract is summarized. A brief chronology of the ALS/NLS program history is also presented to provide the reader with an overview of the many variables influencing the development of the code over the past three years. TURBULENCE MODELLING OF FLOW FIELDS IN THRUST CHAMBERS Final Technical Report, 10 Jun. 1991 - 13 Sep. 1992
C. P. Chen, Y. M. Kim, and H. M. Shang Feb. 1993 53 p
(Contract NAS8-36955)
(NASA-CR-192466; NAS 1.26:192466; UAH-5-32688) Avail: CASI HC A04/MF A01

Following the consensus of a workshop in Turbulence Modelling for Liquid Rocket Thrust Chambers, the current effort was undertaken to study the effects of second-order closure on the predictions of thermochemical flow fields. To reduce the instability and computational intensity of the full second-order Reynolds Stress Model, an Algebraic Stress Model (ASM) coupled with a two-layer near wall treatment was developed. Various test problems, including the compressible boundary layer with adiabatic and cooled walls, recirculating flows, swirling flows, and the entire SSME nozzle flow were studied to assess the performance of the current model. Detailed calculations for the SSME exit wall flow around the nozzle manifold were executed. As to the overall flow predictions, the ASM removes another assumption for appropriate comparison with experimental data to account for the non-isotropic turbulence effects. Author (revised)

TEST FACILITIES FOR EVALUATING NUCLEAR THERMAL PROPULSION SYSTEMS
D. F. Beck, G. C. Allen, L. R. Shipers, D. Dobranich, C. A. Ottinger, C. D.

Harmon, W. C. Fan, and M. Todosow (Brookhaven National Lab., Upton, NY.) 22 Sep. 1992 16 p Presented at the 10th Symposium on Space Nuclear Power and Propulsion, Albuquerque, NM, 10-14 Jan. 1993
(Contract DE-AC04-76DP-00789)
(DE93-002468; SAND-92-2009C; CONF-930103-17) Avail: CASI HC A03/MF A01

Interagency panels evaluating nuclear thermal propulsion (NTP) development options have consistently recognized the need for constructing a major new ground test facility to support fuel element and engine testing. This paper summarizes the requirements, configuration, and baseline performance of some of the major subsystems designed to support a proposed ground test complex for evaluating nuclear thermal propulsion fuel elements and engines being developed for the Space Nuclear Thermal Propulsion (SNTP) program. Some preliminary results of evaluating this facility for use in testing other NTP concepts are also summarized. DOE

100-kW CLASS APPLIED-FIELD MPD THRUSTER COMPONENT WEAR
Maris A. Mantenieks and Roger M. Myers (Sverdrup Technology, Inc., Brook Park, OH.) Jan. 1993 12 p Presented at the 10th Symposium on Space Nuclear Power and Propulsion, Albuquerque, NM, 10-14 Jan. 1993; sponsored by the University of New Mexico
(RTOP 506-42-31)
(NASA-TM-106023; E-7586; NAS 1.15:106023) Avail: CASI HC A03/MF A01

Component erosion and material deposition sites were identified and analyzed during tests of various configurations of 100 kW class, applied-field, water-cooled magnetoplasmadynamic (MPD) thrusters. Severe erosion of the cathode and the boron nitride insulator was observed for the first series of tests, which was significantly decreased by reducing the levels of propellant contamination. Severe erosion of the copper anode resulting from sputtering by the propellant was also observed. This is the first observation of this phenomenon in MPD thrusters. The anode erosion indicates that development of long life MPD thrusters requires the use of light gas propellants such as hydrogen, deuterium, or lithium. Author

A REACTOR-PUMPED LASER AS PRIMARY POWER FOR NUCLEAR ROCKET ENGINES
D. K. Monroe and J. V. Walker 1992 16 p Presented at the Confederation of Independent States (CIS) Conference on Nuclear Thermal Propulsion, Semipalatinsk, Russia, 21 Sep. 1992
(Contract DE-AC04-76DP-00789)
(DE93-005342; SAND-92-2205C; CONF-9209287-1) Avail: CASI HC A03/MF A01

During the last two decades there has been considerable interest in developing alternatives to conventional chemical propulsion for space missions. Laser propulsion has been identified as a serious contender for the task of inexpensively delivering small payloads to low-earth orbit. Recent advances in the development of lasers powered directly by nuclear reaction products offer the potential for new propulsion methods, namely, reactor-laser propulsion. Such systems would allow 'nuclear propulsion' without placing nuclear systems in space. DOE

HEAT PIPE HEAT TRANSPORT SYSTEM FOR THE STIRLING SPACE POWER CONVERTER (SSPC)
Donald L. Alger Cleveland, Ohio Aug. 1992 11 p Presented at the 27th Intersociety Energy Conversion Engineering Conference, San Diego, CA, 3-7 Aug. 1992; sponsored by the SAE, ACS, AIAA, ASME, IEEE, AIChE, and ANS
(Contract NAS3-25266; RTOP 590-13-11)
(NASA-CR-191065; E-7118; NAS 1.26:191065) Avail: CASI HC A03/MF A01

Life issues relating to a sodium heat pipe heat transport system are described. The heat pipe system provides heat, at a temperature of 1050 K, to a 50 kWe Stirling engine/linear alternator power converter called the Stirling Space Power Converter (SSPC). The converter is being developed under a National Aeronautics and Space Administration program. Since corrosion of heat pipe materials in contact with sodium can impact the life of the heat pipe, a literature review of sodium corrosion processes was performed. It was found that the impurity reactions, primarily oxygen, and dissolution of alloy elements were the two corrosion process likely to be operative in the heat pipe. Approaches that are being taken to minimize these corrosion processes are discussed. Author

USER'S MANUAL FOR THE ALS BASE HEATING PREDICTION CODE, VOLUME 2
John E. Reardon and Michael S. Fulton Nov. 1992 30 p
(Contract NAS8-38141)
(NASA-CR-192457; NAS 1.26:192457; RTR-218-01-Vol-2) Avail: CASI HC A03/MF A01

The Advanced Launch System (ALS) Base Heating Prediction Code is based on a generalization of first principles in the prediction of plume induced base convective heating and plume radiation. It should be considered to be an approximate method for evaluating trends as a function of configuration variables because the processes being modeled are too complex to allow an accurate generalization. The convective methodology is based upon generalizing trends from four nozzle configurations, so an extension to use the code with strap-on boosters, multiple nozzle sizes, and variations in the propellants and chamber pressure histories cannot be precisely treated. The plume radiation is more amenable to precise computer prediction, but simplified assumptions are required to model the various aspects of the candidate configurations. Perhaps the most difficult area to characterize is the variation of radiation with altitude. The theory in the radiation predictions is described in more detail. This report is intended to familiarize a user with the interface operation and options, to summarize the limitations and restrictions of the code, and to provide information to assist in installing the code. PRELIMINARY BASE HEATING ENVIRONMENTS FOR A GENERALIZED ALS LO2/LH2 LAUNCH VEHICLE, APPENDIX 1 AND 2
Robert L. Bender and John E. Reardon 19 Oct. 1989 352 p
(Contract NAS8-39141)
(NASA-CR-192456; NAS 1.26:192456; RTN-218-01-App-1-2; RL-91-61-ATT-9.1-App-1-2) Avail: CASI HC A16/MF A03

A secondary objective of contract NAS8-39141 is to provide base heating assessments, as required, to support Advanced Launch System (ALS) preliminary launch vehicle and propulsion system design studies. The ALS propulsion systems integration working group meeting (No. 3) recently completed in San Diego, California, focused attention on the need for base heating environment determination to provide preliminary requirements for LO2/LH2 propulsion systems currently being considered for ALS. We were requested to provide these environments for a range of possible propellant mixture and nozzle area ratios. Base heating environments can only be determined as a function of altitude when the engine operating conditions and vehicle base region geometry (engine arrangement) are known. If time dependent environments are needed to assess thermal loads, a trajectory must also be provided. These parameters are not fixed at this time since the ALS configurations and propulsion operating conditions are varied and continue to be studied by Phase B contractors. Therefore, for this study, a generalized LO2/LH2 system was selected along with a vehicle configuration consisting of a seven-engine booster and a three-engine core. MSFC provided guidance for the selection. We also selected a limited number of body points on the booster and core vehicles and engines for the environment estimates. Environments at these locations are representative of maximum heating conditions in the

base region and are provided as a function of altitude only. Guidelines and assumptions for this assessment, methodology for determining the environments, and preliminary results are provided in this technical note. Refinements in the environments will be provided as the ALS design matures. Author

TERMINOLOGY AND ASSESSMENT METHODS OF SOLID PROPELLANT ROCKET EXHAUST SIGNATURES [METHODES D'EVALUATION DES SIGNATURES DES PROPULSEURS A PROPERGOL SOLIDE]
Feb. 1993 271 p
(AGARD-AR-287; ISBN-92-835-0699-5) Copyright Avail: CASI HC A12/MF A03

The Propulsion and Energetics Panel's Specialists' Meeting in autumn 1985 on Smokeless Propellants demonstrated that no common standard was available in this field and that the lack of common understanding led to misunderstanding amongst the NATO community. After some preparatory discussion, the Panel, therefore, formed Working Group Number 21 with the objectives of defining methods for the assessment of rocket motor exhaust optical properties in the visible and in the infrared range, and of recommending a terminology based on quantitative criteria. The Working Group discussed the subject in a total of eight sessions and prepared this Advisory Report. Following an Introduction and Summary there are six chapters, commencing with an Overview and continuing with Propellant Smoke Classification, Plume Primary Smoke, Plume Secondary Smoke, Plume Radiation and Plume Microwave Properties. In most cases, the conclusions and recommendations follow the chapters and are not repeated at the end of the report. Author (revised)

(Contract NAS3-25280; RTOP 506-41-31)
(NASA-CR-187148; E-7712; NAS 1.26:187148) Avail: CASI HC A03/MF A01

This report summarizes the results of a study performed by Hughes Danbury Optical Systems, HDOS, (formerly Perkin-Elmer) to design, fabricate, and test a lightweight (2 kg/sq M), self supporting, and highly reflective sub-scale concentrating mirror panel suitable for use in space. The HDOS panel design utilizes Corning's 'micro sheet' glass as the top layer of a composite honeycomb sandwich. This approach, whose manufacturability was previously demonstrated under an earlier NASA contract, provides a smooth (specular) reflective surface without the weight of a conventional glass panel. The primary result of this study is a point design and it's performance assessment. Author

(NASA-TM-106050; E-7640; NAS 1.15:106050) Avail: CASI HC A03/MF A01

The NASA Lewis Research Center, located in Cleveland, Ohio, has a number of space chemical propulsion test facilities which constitute a significant national space testing resource. The purpose of this paper is to make more users aware of these test facilities and to encourage their use through cooperative agreements between the government, industry, and universities. Research which is of interest to the government is especially encouraged and often can be done in a cooperative manner that best uses the resources of all parties. An overview of the Lewis test facilities is presented. Author (revised)

This Program User's Guide discusses the Nuclear Thermal Propulsion (NTP) engine system design features and capabilities modeled in the Nuclear Engine System Simulation (NESS): Version 2.0 program (referred to as NESS throughout the remainder of this document), as well as its operation. NESS was upgraded to include many new modeling capabilities not available in the original version delivered to NASA LeRC in Dec. 1991, NESS's new features include the following: (1) an improved input format; (2) an advanced solid-core NERVA-type reactor system model (ENABLER 2); (3) a bleed-cycle engine system option; (4) an axial-turbopump design option; (5) an automated pump-out turbopump assembly sizing option; (6) an off-design gas generator engine cycle design option; (7) updated hydrogen properties; (8) an improved output format; and (9) personal computer operation capability. Sample design cases are presented in the user's guide that demonstrate many of the new features associated with this upgraded version of NESS, as well as design modeling features associated with the original version of NESS. (Contract NAS3-25809; RTOP 593-71-00)
(NASA-CR-191080; E-7622; NAS 1.26:191080) Avail: CASI HC A06/MF A02

A Nuclear Thermal Propulsion (NTP) engine system design analysis tool is required to support current and future Space Exploration Initiative (SEI) propulsion and vehicle design studies. Currently available NTP engine design models are those developed during the NERVA program in the 1960's and early 1970's and are highly unique to that design or are modifications of current liquid propulsion system design models. To date, NTP engine-based liquid design models lack integrated design of key NTP engine design features in the areas of reactor, shielding, multi-propellant capability, and multi-redundant pump feed fuel systems. Additionally, since the SEI effort is in the initial development stage, a robust, verified NTP analysis design tool could be of great use to the community. This effort

developed an NTP engine system design analysis program (tool), known as the Nuclear Engine System Simulation (NESS) program, to support ongoing and future engine system and stage design study efforts. In this effort, Science Applications International Corporation's (SAIC) NTP version of the Expanded Liquid Engine Simulation (ELES) program was modified extensively to include Westinghouse Electric Corporation's near-term solid-core reactor design model. The ELES program has extensive capability to conduct preliminary system design analysis of liquid rocket systems and vehicles. The program is modular in nature and is versatile in terms of modeling state-of-the-art component and system options as discussed. The Westinghouse reactor design model, which was integrated in the NESS program, is based on the near-term solid-core ENABLER NTP reactor design concept. This program is now capable of accurately modeling (characterizing) a complete near-term solid-core NTP engine system in great detail, for a number of design options, in an efficient manner. The following discussion summarizes the overall analysis methodology, key assumptions, and capabilities associated with the NESS presents an example problem, and compares the results to related NTP engine system designs. Initial installation instructions and program disks are in Volume 2 of the NESS Program User's Guide. Author

In a system such as a 20 kHz space station primary electrical power distribution system, power conversion from AC to DC is required. Some of the basic requirements for this conversion are high efficiency, light weight and small volume, regulated output voltage, close to unity input power factor, distortionless input current, soft-starting, low electromagnetic interference, and high reliability. An AC-to-DC converter is disclosed which satisfies the main design objectives of such converters for use in space. The converter of the invention comprises an input transformer, a resonant network, a current controller, a diode rectifier, and an output filter. The input transformer is for connection to a single phase, high frequency, sinusoidal waveform AC voltage source and provides a matching voltage isolating from the AC source. The resonant network converts this voltage to a sinusoidal, high frequency bidirectional current output, which is received by the current controller to provide the desired output current. The diode rectifier is connected in parallel with the current controller to convert the bidirectional current into a unidirectional current output. The output filter is connected to the rectifier to provide an essentially ripple-free, substantially constant voltage DC output. CISTI

A TRAJECTORY GENERATION AND SYSTEM CHARACTERIZATION MODEL FOR CISLUNAR LOW-THRUST SPACECRAFT. VOLUME 1: USER'S MANUAL Final Report (Diskette Supplement)
David J. Korsmeyer, Elfego Pinon, III, Brendan M. OConnor, and Curt R. Bilby May 1990 53 p Diskette supplement: 2 IBM compatible 5.25-inch DSDD diskettes
(Grant NAG3-928; RTOP 506-64-12)
(NASA-CR-185171; NAS 1.26:185171; LSPI-902-Vol-1; NONP-Suppl-DK-93-159803) Avail: Issuing Activity (Center for AeroSpace Information) HC/DK A13

The documentation of the Trajectory Generation and System Characterization Model for the Cislunar Low-Thrust Spacecraft is presented in Technical and User's Manuals. The system characteristics and trajectories of low-thrust nuclear electric propulsion spacecraft can be generated through the use of multiple system technology models coupled with a high-fidelity trajectory generation routine. The Earth to Moon trajectories utilize near Earth orbital plane alignment, midcourse control dependent upon the spacecraft's Jacobian constant, and capture to target orbit utilizing velocity matching algorithms. The trajectory generation is performed in a perturbed two-body equinoctial formulation and the restricted three-body formulation. A single control is determined by the user for the interactive midcourse portion of the trajectory. The full spacecraft system characteristics and trajectory are provided as output. The software is included on two floppy disks. Author

Amorphous diamondlike carbon (DLC) films were deposited using both single and dual ion beam techniques utilizing filament and hollow cathode ion sources. Continuous DLC films up to 3000 A thick were deposited on fused quartz plates. Ion beam process parameters were varied in an effort to create hard, clear films. Total DLC film absorption over visible wavelengths was obtained using a Perkin-Elmer spectrophotometer. An ellipsometer, with an Ar-He laser (wavelength 6328 A) was used to determine index of refraction for the DLC films. Scratch resistance and frictional and adherence properties were determined for select films. Applications for these films range from military to the ophthalmic industries. Author

SLIDING DURABILITY OF CANDIDATE SEAL FIBER MATERIALS IN HYDROGEN FROM 25 TO 900 C
Christopher DellaCorte and Bruce M. Steinetz 1992 18 p Prepared for presentation at the 5th NASA/NASP Hydrogen-Material Interactions Workshop, Scottsdale, AZ, 23-25 Sep. 1993
(RTOP 505-63-1A)
(NASA-TM-105939; E-7456; NAS 1.15:105939) Avail: CASI HC A03/MF A01

Sliding durability studies of candidate ceramic fibers were conducted in hydrogen to support the high temperature seal development program at NASA LeRC. Pin-on-disk tests were used to measure the friction and durability of a tow or bundle of ceramic fibers in sliding against a superalloy disk. This procedure was used previously to test candidate fibers in an air environment. The fibers based upon mullite (Al2O3-SiO2) chemistry (Nextel 550, 440, and 312) exhibited better durability in hydrogen than in air. HPZ, a complex silicon carboxynitride fiber which showed good durabilty in air, however, showed a significant loss of durability in hot hydrogen. These results are consistent with recent thermodynamic and experimental studies of ceramic compatibility with hydrogen at elevated temperatures. These research results indicate that only oxide fibers display good durability in both air and hydrogen environments. Also, simple, low cost testing in air can provide an adequate data base for initial seal material screening and selection, especially for oxide fiber candidates. The findings of this research provide critical input to the seal design team. Author (revised)

DETERMINATION OF ATOMIC OXYGEN FLUENCE USING SPECTROPHOTOMETRIC ANALYSIS OF INFRARED TRANSPARENT WITNESS COUPONS FOR LONG DURATION EXPOSURE TESTS
Gregg M. Podojil (Cleveland State Univ., OH.) and Donald A. Jaworske Feb. 1993 14 p
(RTOP 506-41-41)
(NASA-TM-106021; E-7582; NAS 1.15:106021) Avail: CASI HC A03/MF A01

Atomic oxygen degradation is one of several major threats to the durability of spaceborne systems in low Earth orbit. Ground-based simulations are conducted to learn how to minimize the adverse effects of atomic oxygen exposure. Assessing the fluence of atomic oxygen in test chambers such as a plasma asher over long periods of time is necessary for accurate determination of atomic oxygen exposure. Currently, an atomic oxygen susceptible organic material such as Kapton is placed next to samples as a witness coupon and its mass loss is monitored and used to determine the effective atomic oxygen fluence. However, degradation of the Kapton witness coupons occurs so rapidly in plasma ashers that for any long term test many witness coupons must be used sequentially in order to keep track of the fluence. This necessitates opening vacuum to substitute fresh coupons. A passive dosimetry technique was sought to monitor atomic oxygen exposure over longer periods without the need to open the plasma asher to the atmosphere. This paper investigates the use of spectrophotometric analysis of durable IR transparent witness coupons to measure atomic oxygen exposure for longer duration testing. The method considered would be conductive to making in situ measurements of atomic oxygen fluence. Author

AN ALTERNATIVE MODEL FOR ESTIMATING LIQUID DIFFUSION COEFFICIENTS REQUIRING NO VISCOSITY DATA

Wilfredo Morales Mar. 1993 22 p

(RTOP 505-63-5A)

(NASA-TM-106079; E-7695; NAS 1.15:106079) Avail: CASI HC A03/MF A01

An equation, based on the free volume of a liquid solvent, was derived via dimensional analysis, to predict binary diffusion coefficients. The equation assumed that interaction between the solute and liquid solvent molecules followed a Lennard-Jones potential. The equation was compared to other diffusivity equations and was found to give good results over the temperature range examined. Author

POLYBENZOXAZOLES VIA AROMATIC NUCLEOPHILIC DISPLACEMENT Patent Application

Paul M. Hergenrother, inventor (to NASA), John W. Connell, inventor (to NASA), and Joseph G. Smith, Jr., inventor (to NASA) (Akron Univ., OH.) 10 Apr. 1992 20 p

(NASA-Case-LAR-14606-1-CU; NAS 1.71:LAR-14606-1-CU; US-Patent-Appl-SN-867864) Avail: CASI HC A03/MF A01

Polybenzoxazoles (PBO) are heterocyclic macromolecules which were first synthesized in a two-step process by the initial formation of aromatic diacid chlorides with bis(o-aminophenol)s through solution condensation of aromatic diacid chlorides with bis(o-aminophenol)s followed by thermal cyclodehydration. Since then several methods have been utilized in their synthesis. The most common synthetic method for PBO involves a polycondensation of bis(o-aminophenol)s with aromatic diacid diphenyl esters. Another preparative route involves the solution polycondensation of the hydrochloride salts of bis(o-amino phenol)s with aromatic diacids in polyphosphoric acid. Another synthetic method involves the initial formation of poly(o-hydroxy amide)s from silylated bis(o-aminophenol)s with aromatic diacid chlorides followed by thermal cyclodehydration to PBO. A recent preparative route involves the reaction of aromatic bisphenols with bis(fluorophenyl) benzoxazoles by the displacement reaction to form PBO. The novelty of the present invention is that high molecular weight PBO of new chemical structures are prepared that exhibit a favorable combination of physical and mechanical properties. NASA

The Industrial Materials Institute (IMI) of Canada's National Research Council has the mission to promote growth and competitiveness of Canadian industry through basic and applied research related to materials processing technologies. To carry out this mission, the IMI undertakes research and development projects in collaboration with industry on materials characterization and on the control, simulation, and perfection of process systems. It also promotes awareness of the latest in materials technology, supports improved utilization by demonstration projects and complementary activities, and provides coordination to all materials activities at the Council. There are currently 13 active research programs at the IMI in four sections: Instrumentation and Sensors, Metals and Ceramics, Industrial Polymers, and Computer Integrated Materials Processing. Research goals and major achievements in these programs are reviewed for 1991-1992. Lists of publications are also included. CISTI

Quantitative structure property relationships (QSPR's) utilizing total molecular surface area (TSA) are evaluated for predicting physical-chemical properties (aqueous solubility and saturation vapor pressure) used to determine environmental partitioning and transport of hydrophobic organic contaminants. The theoretical relationship between the physical-chemical properties and TSA is reexamined and, methods and parameters for calculating TSA were compared including: standard (planar) geometries and bond lengths versus energy minimized molecular coordinates, van der Waals versus contact/reentrant surface area, and van der Waals radii. Two assumptions for estimating the molar free energy of fusion are also evaluated. A strong, thermodynamically sound relationship between TSA and aqueous solubility allows for solubility predictions of aromatic chemicals from 5 C to 40 C with an average absolute error of 92 degrees. A weaker, empirical relationship between saturation vapor pressure and TSA yields vapor pressure estimates for organic contaminants with an average absolute error of 232 percent between 5 deg C and 40 deg C. The results indicate that the work of cavity formation in water and/or the work of adhesion between the solute and water is the dominant term in the dissolution process, and is adequately described via a TSA-QSPR. Conversely, the work required to remove a molecule from bulk liquid to vapor is loosely related to TSA. The predicted physical-chemical properties can be used to determine the air/water partition coefficients of organic contaminants at environmental temperatures. GRA

APPLICATION OF NEUTRON DIFFRACTION TECHNOLOGY TO THE DETERMINATION OF RESIDUAL STRAIN IN ENGINEERING COMPOSITES

D. S. Kupperman 1992 19 p Presented at the Winter Annual Meeting of the ASME, Anaheim, CA, 8-13 Nov. 1992

(Contract W-31-109-eng-38)

(DE93-004249; ANL/CP-77428; CONF-921110-37) Avail: CASI HC A03/MF A01

Knowledge of fabrication induced residual stresses in the fiber and matrix of advanced engineering composites is important as these stresses can greatly influence the mechanical properties of these composites. In this paper, the application of neutron diffraction technology to the determination of thermal residual strains in the constituents of composites (from which stresses can be calculated) is discussed. Experimental determination of temperature dependent strain in the fiber and matrix of three composites compare favorably with the results of analytical and finite element methods used to predict strain. These composites (two ceramic matrix and one metal matrix) are materials of interest to a variety of industries. In this paper, the benefit of applying a National Laboratory developed technology to a problem of interest to industry, is shown. DOE

THEORETICAL MODELS FOR THE ULTIMATE STRENGTH AND FLAW RESISTANCE OF UNIDIRECTIONALLY-REINFORCED CERAMIC-MATRIX COMPOSITES

P. S. Steif 1992 8 p

(Contract DE-FG02-89ER-45404)

(DE93-005881; DOE/ER-45404/3) Avail: CASI HC A02/MF A01

Progress is reported in the following areas: (1) interpretation of interface tests; (2) the effect of interface properties on flexural strength and its connection with uniaxial tensile strength; and (3) the effect of interface properties on uniaxial tensile strength. The goal is to establish relations between manipulable material variables and mechanical response. The approach was as follows: (1) to hypothesize as to the key underlying physical mechanisms and to represent these hypotheses with model theoretical problems which can relate material parameters to observed mechanical behavior; (2) to develop the necessary techniques to analyze the model problems; and (3) to test the models by comparing the obtained results with experimental data. Phases 1 and 2 were been brought to

satisfactory completion; work remains to be done on the third phase.

Neutron diffraction provides a unique method for examining materials during thermomechanical loading because it is nondestructive and penetrating and can distinguish between the strains in individual phases. Using a pulsed neutron source, all lattice reflections are recorded in all constituents simultaneously. Preliminary in-situ strain measurements under load of an aluminum/titanium carbide composite are presented. The measurements were made using a compact stress rig on the neutron powder diffractometer at the Manuel Lujan Jr. Neutron Scattering Center at Los Alamos National Laboratory. DOE

SOL-GEL/RHODAMINE 6G COMPOSITE FILMS WITH TAILORED MICROSTRUCTURES
D. L. Logan, C. S. Ashley, R. A. Assink, and C. J. Brinker 1992 10 p Presented at the 2nd Sol-Gel Optics Conference, San Diego, CA, 19-24 Jul. 1992
(Contract DE-AC04-76DP-00789)
(DE93-005364; SAND-92-0037C; CONF-9207172-1) Avail: CASI HC A02/MF A01

A multi-step hydrolysis procedure was developed to prepare composite organic dye/sol-gel thin films with variable porosity for such as switches or sensors. Variation of acid and base catalyzed hydrolysis sequences of three sols prepared from tetraethoxysilane with identical H2O/Si ratios, dilution factors, and pH resulted in considerably different silicate speciation. Under conditions where monomer was avoided, the refractive indices of as-deposited films could be varied by an again step prior to film deposition. This general strategy, which relies on the aggregation of fractal polymeric clusters, is compatible with the low temperature and near neutral pH requirements of both organic dyes and biologically active species such as enzymes. INFLUENCE OF FIBER COATINGS ON THE OXIDATION OF FIBER-REINFORCED SiC COMPOSITES
P. F. Tortorelli, L. Riester, R. A. Lowden, and S. Nijhawan (Coe Coll., Cedar Rapids, IA.) 1993 9 p Presented at the 17th Annual Conference on Composites and Advanced Ceramics, Cocoa Beach, FL, 11-15 Jan. 1993
(Contract DE-AC05-84OR-21400)
(DE93-006742; CONF-930164-4) Avail: CASI HC A02/MF A01

Thermogravimetric analysis was used to study the reaction kinetics associated with high-temperature air oxidation of graphite- or BN-coated Nicalon-reinforced SiC composites. For those with graphite interlayers, the shapes of the thermogravimetric curves, and the dependencies of weight changes on interfacial layer thickness and exposure temperature, could be explained on the basis of concurrent reactions associated with oxidation of the graphite and the formation of SiO2 on the matrix and fibers. The oxidation resistance of SiC with BN-coated Nicalon fibers was significantly better than when graphite coatings were used.. Flexure tests of Nicalon/graphite/SiC previously oxidized in air at 950 C revealed that degradation of fracture resistance can be detected after very short exposure times (less than 1 h). Accordingly, a knowledge of reaction kinetics is important in characterizing environmental effects on fracture and damage and in predicting the rate of properties degradation. DOE

The application of the INJECTEX (trademark) procedure to the 1H/11H material of the CFM56-517 engine is reported. This procedure is based on Resin Transfer Modeling (RTM) technology which is used for the production of composite parts. RTM consists of injecting a resin into a mold containing reinforcing fibers. The differences between RTM and INJECTEX are outlined. The main difference being that INJECTEX involves the use of high performance technical fibers. The fibers and resins used in the INJECTEX procedure are described. The procedure is outlined giving details of the dry performing technology and the injection procedure. Results of tests of the mechanical properties of plates molded by the INJECTEX procedure are presented. The potential application to the following is considered: fittings in the interior of civil planes, exterior secondary parts, primary exterior parts, and engine parts. ESA

It is shown that the structural weight of push rods used in commercial aircraft can be signficantly reduced by using Carbon Fiber Reinforced Plastics (CFRP) instead of aluminum. A simple substitution is not possible on account of the load transmission and the complex stress states generated by them. Besides stiffness and strength, the production costs are another important parameter. A form locking load transmission which can be adapted to standardized CFRP rods demonstrates how the properties of high strength and low structural weight can be combined with an economically advantageous wholescale production. INTERLAMINAR MODE-2 FRACTURE TOUGHNESS OF A GLASS-FIBER EPOXY LAMINATE
Heikki Keinanen, Tero Uuttu, and Mikko Lehtonen 1992 33 p Sponsored by Technical Research Centre of Finland
(VTT-Pubs-105; ISBN-951-38-4223-1; ETN-93-93543) Copyright Avail: CASI HC A03/MF A01

Fracture mechanics and experimental mechanics approaches were used to characterize mode 2 interlaminar fracture of a Glass Fiber Reinforced Epoxy (GRFP) laminate. Mode 2 interlaminar fracture toughness was characterized by using the End Notched Flexure (ENF) test. The ENF specimen was modeled by using both analytical (beam theory) and numerical (finite element method) approaches. Calculated results were compared to experimental ones and the interlaminar mode 2 fracture toughness of the

particular laminate was determined. In the particular case the ENF test is suitable for characterization of the interlaminar fracture toughness. ESA

(NASA-CR-4488; E-7557; NAS 1.26:4488) Avail: CASI HC A04/MF A01

A 2-D axisymmetric model was employed to determine the magnitude of the radial, axial, and hoop stresses caused by the thermal expansion difference between fiber and matrix and which result from the fabrication temperature cycle. Finite element analysis was conducted for single fiber model systems based on SCS-6/Ti3Al+Nb and Al2O3/NiAl. The stress distribution due to the imposition of a graded intermediate layer for each system was determined and included variables of layer thickness and gradation in interlayer chemistry in order to vary the expansion gradient between fiber and matrix. Thermal cycling tests were conducted on sputter coated SCS-6 fibers selectively coated with Ti3Al+Nb, with and without an intermediate layer. Cracking of the Ti3Al+Nb layers was prevented by an interlayer based on Ti-TiN-Ti. The interlayer thickness appeared critical to its efficiency. Similarly, for the case of Al2O3/NiAl, an intermediate layer consisting of a Ni bond coat on the sapphire fiber followed by a graded Al2O3-NiAl layer did not crack when given a thermal excursion to 1100 C and then cooled to room temperature. Acoustic emission tests on single fiber specimens were unsuccessful in detecting load drops associated with the successive fracture of the fiber. For the SCS-6/Ti3Al system this was the result of several factors which included the matrix/fiber ratio and poor bonding of the matrix and fiber. In the case of the Al2O3/NiAl system brittle failure of the NiAl matrix precluded fiber breakdown during tensile loading. Author (revised)

(Contract W-31-109-eng-38)
(DE92-014868; ANL/CP-75205; CONF-930414-1) Avail: CASI HC A03/MF A01

Steady-state solid-particle erosion has been investigated on in-situ reinforced Si3N4 and the 'equivalent' fine-grained hot-isostatically-pressed Si3N4 whose R-curve behaviors are quite different, having K(sub IC) values in the long-crack-limit of 8.3 and 5.6 MPa m(exp (1/2)), respectively. Experiments were carried out at 20 C, using SiC abrasives, whose diameters ranged from 42 to 1035 micron, varying the angle of impact from 15 to 90 degrees and the velocity from 50 to 100 to 150 m/s. The erosion rates of the two materials were, within a factor of two, the same, indicating that the long-crack-length-limit toughness is not an indication of erosion resistance, for the range of particle sizes and velocities studied. DOE

ROLE OF INTERFACES ON THE DUCTILE FRACTURE PROCESS OF DISCONTINUOUS FIBER REINFORCED COMPOSITES
S. B. Biner 1992 7 p Presented at the International Conference on Advanced Composites 1993, Wollongoup, Australia, 15-19 Feb. 1993
(Contract W-7405-eng-82)
(DE93-004464; IS-M-736; CONF-930246-2) Avail: CASI HC A02/MF A01

The roles of fiber morphology, interface failure, and void nucleation mechanisms within the matrix on the deformation and fracture behavior of discontinuous fiber reinforced composites was numerically investigated. The matrix was modelled using a constitutive relationship that accounts for strength degradation resulting from the nucleation and growth of voids, and fibers are assumed to be elastic. The debonding behavior at the fiber interfaces was simulated in terms of a cohesive zone model which describes the decohesion by both normal and tangential separation. The results indicate that in the absence of interface failure, for a given matrix failure mechanism, the fiber morphology strongly affects the strength and ductility of discontinuous fiber reinforced composites. The weak interfacial behavior can significantly increase the ductility without sacrificing the strength for certain fiber morphology and for certain void nucleation mechanisms. DOE

COMPRESSION STRENGTH FAILURE MECHANISMS IN UNIDIRECTIONAL COMPOSITE LAMINATES CONTAINING A HOLE Final Report, 1 Jun. 1981 - 1 Jun. 1989
Eric R. Johnson Apr. 1993 16 p
(Grant NAG1-201)
(NASA-CR-192813; NAS 1.26:192813) Avail: CASI HC A03/MF A01

Experiments on graphite-epoxy laminated plates containing unloaded small holes show that these laminates are notch insensitive. That is, the uniaxial strength of these laminates with small holes exceeds the strength predicted by a point stress criterion using the stress concentration factor for the in-plane stress field. Laminates containing large holes exhibit notch sensitive behavior and consequently their strength is reasonably well predicted by the stress concentration effect. This hole size effect is manifested both in tension and in compression. Apparently, some mechanism must cause in-plane stress relief for laminates containing small holes. The purpose of this research was to study the influence of geometric nonlinearity on the micromechanical response of a filamentary composite material in the presence of a strain gradient caused by a discontinuity such as a hole. A mathematical model was developed at the micromechanical level to investigate this geometrically nonlinear effect. Author

ANALYSIS OF DELAMINATION RELATED FRACTURE PROCESSES IN COMPOSITES Final Technical Report, Feb. 1986 - Dec. 1992
Erian A. Armanios Dec. 1992 155 p
(Grant NAG1-637)
(NASA-CR-192632; NAS 1.26:192632) Avail: CASI HC A08/MF A02

This is a final report that summarizes the results achieved under this grant. The first major accomplishment is the development of the sublaminate modeling approach and shear deformation theory. The sublaminate approach allows the flexibility of considering one ply or groups of plies as a single laminated unit with effective properties. This approach is valid when the characteristic length of the response is small compared to the sublaminate thickness. The sublaminate approach was validated comparing its predictions with a finite element solution. A shear deformation theory represents an optimum compromise between accuracy and computational effort in delamination analysis of laminated composites. This conclusion was reached by applying several theories with increasing level of complexity to the prediction of interlaminar stresses and strain energy release rate in a double cracked-lap-shear configuration. LOCALIZED DAMAGE DEVELOPMENT IN NOTCHED COMPOSITE PLATES SUBJECTED TO COMPRESSIVE LOADING
C. J. Poon, N. C. Bellinger, and R. W. Gould Jul. 1992 22 p
(CTN-93-60663) Avail: CASI HC A03

The mechanism of localized damage development in notched plates made of graphite/epoxy composite under compressive loading was investigated. Flat composite plates with an open hole in the center were loaded in compression and damage development at the hole edge was determined by the ultrasonic C-scan method and penetrant enhanced x-ray radiography. It was observed that the initial damage development occurs at about 90 percent of the ultimate load. This initial damage consists of localized delamination, ply buckling, and fiber fracture at the edge of the hole. A further increase in load level triggers rapid damage progression from the hole edge to the longitudinal edges of the plate. A 3-dimensional finite element analysis was performed to determine the interlaminar stresses at the hole edge. When these interlaminar stresses were used in conjunction with a proposed failure criterion, the strain level at which damage initiated was predicted. The predictive results demonstrate good agreement with experimental data. Author (CISTI)

THE EFFECTS OF DELAMINATION ON THE VIBRATIONAL CHARACTERISTICS OF COMPOSITE STRUCTURAL ELEMENTS Ph.D. Thesis
Kenneth Bhalla 1992 214 p
Avail: Univ. Microfilms Order No. DA9236005

The frequencies of vibration and mode shapes of delaminated beams and annular plates are studied to determine whether the change in frequency response or mode shape is a satisfactory criterion for determining the existence, location, and size of defects in laminated composite materials. Composites beams and plates composed of two laminae having a 1:1 and 2:1 thickness ratio were considered. A quantitative relationship between delamination length and frequency response was found. This relationship was determined through a consideration of the governing differential equations, by finite element analysis, and through experimental evaluation. The results are presented as a series of graphs, showing the change in the first three natural frequencies as a function of delamination length together with the variation of the tip displacement of a cantilevered beam for a constant energy input. The influence of the delamination on the frequency was noticeable in higher modes than lower. Dissert. Abstr.

THE MECHANICAL PROPERTIES OF A NOVEL Si3N4-AMORPHOUS Si3N4 COMPOSITE
I. E. Reimanis, J. J. Petrovic, H. Suematsu, T. E. Mitchell, and O. S. Leung 1992 7 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract W-7405-eng-36)
(DE93-005473; LA-UR-92-4276; CONF-921101-55) Avail: CASI HC A02/MF A01

The hardness and fracture toughness of a model two-phase composite consisting of crystalline Si3N4 particles in a matrix of amorphous Si3N4 are examined. The composite is created by beat treating high purity, partially amorphous CVD Si3N4 in N2 for various times and temperatures in order to induce crystallization of the alpha phase. Microindentation tests at temperatures up to 1200 C are conducted to evaluate the high-temperature hardness and fracture toughness. The role of the microstructure is examined using optical and transmission electron microscopy. Finally, the relation between microstructure and the mechanical properties is discussed. DOE

EVALUATION OF TENSILE STATIC, DYNAMIC, AND CYCLIC FATIGUE BEHAVIOR FOR A HIPed SILICON NITRIDE AT ELEVATED TEMPERATURES
Chih-Kuang Jack Lin (Oak Ridge Inst. of Nuclear Studies, Inc., TN.), M. G. Jenkins, and M. K. Ferber 1992 7 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-005149; CONF-921101-27) Avail: CASI HC A02/MF A01

Tensile fatigue behavior of a hot-isostatically-pressed (HIPed) silicon nitride was investigated over ranges of constant stresses, constant stressing rates, and cyclic loading at 1150-1370 C. At 1150 C, static and dynamic fatigue failures were governed by slow crack growth mechanism. Creep rupture was the dominant failure mechanism in static fatigue at 1260 and 1370 C. A transition of failure mechanism from slow crack growth to creep rupture appeared at stressing rates less than or equal to 10(exp -2) MPa/s for dynamic fatigue at 1260 and 1370 C. At 1150-1370 C, cyclic loading appeared to be less damaging than static loading as cyclic fatigue specimens last longer than static fatigue specimens under the same maximum stresses. DOE

GEL TIME MEASUREMENTS ON CARBON FIBER/EPOXY RESIN PREPREGS
J. P. Alary, S. Lazcano, A. Sanchez, A. T. Rodriguez, and J. Sanchez 1990 8 p
(ICAS-90-4-10-4; ETN-93-93697) Avail: CASI HC A02/MF A01

The curing process of a modified epoxy resin/carbon fiber prepreg, Hercules 8552/AS4, was analyzed by means of Differential Scanning Calorimetry (DSC) and Rheometrics Dynamic Spectrometer (RDS). Isothermal and nonisothermal experiments were carried out, and similar studies were performed in the near resin Hercules 8552. DSC and RDS data were compared with the main goal of establishing a correlation between the gel time determined by both means, together with the ones measured in a Fisher-Johns apparatus. A simple criterion for obtaining the gel point by DSC measurements was found. Comparison between the three tests showed good agreement for the calculated gel times. The activation energies of the gelification process were calculated and similar values were obtained for the three data series. ESA

INTEGRATED ANALYSIS AND DESIGN OF THICK COMPOSITE STRUCTURES FOR OPTIMAL PASSIVE DAMPING CHARACTERISTICS Final Report
D. A. Saravanos Mar. 1993 69 p
(Contract NCC3-208/4; RTOP 505-63-5B)
(NASA-CR-190783; E-7676; NAS 1.26:190783) Avail: CASI HC A04/MF A01

The development of novel composite mechanics for the analysis of damping in composite laminates and structures and the more significant results of this effort are summarized. Laminate mechanics based on piecewise continuous in-plane displacement fields are described that can represent both intralaminar stresses and interlaminar shear stresses and the associated effects on the stiffness and damping characteristics of a composite laminate. Among other features, the mechanics can accurately model the static and damped dynamic response of either thin or thick composite laminates, as well as, specialty laminates with embedded compliant damping layers. The discrete laminate damping theory is further incorporated into structural analysis methods. In this context, an exact semi-analytical method for the simulation of the damped dynamic response of composite plates was developed. A finite element based method and a specialty four-node plate element were also developed for the analysis of composite structures of variable shape and boundary conditions. Numerous evaluations and applications demonstrate the quality and superiority of the mechanics in predicting the damped dynamic characteristics of composite structures. Finally, additional development was focused on the development of optimal tailoring methods for the design of thick composite structures based on the developed analytical capability. Applications on composite plates illustrated the influence of composite mechanics in the optimal design of composites and the potential for significant deviations in the resultant designs when more simplified (classical) laminate theories are used.

CHARACTERIZATION OF MECHANICAL DAMAGE MECHANISMS IN CERAMIC AND POLYMERIC MATRIX COMPOSITE MATERIALS Technical Report, Oct. 1991 - Oct. 1992
James Lankford, Jr. Dec. 1992 79 p
(Contract N00014-92-C-0093)
(AD-A260129; Rept-06-5035) Avail: CASI HC A05/MF A01

In order to better establish the fundamental mechanisms responsible for the onset of microstructural instability during compressive loading, several fiber-reinforced polymeric matrix composites were tested under conditions involving hydrostatic confinement. It was found that the dependence of strength upon pressure was mild, indicating that the overwhelming factor in the compressive failure of these materials, irrespective of fiber type, matrix, composition, and composite architecture is resistance to shear loading; dilatational mechanisms, certainly ones associated with microfracture, are relatively insignificant. Specific strength levels do appear to be controlled by both inelastic and plastic flow properties of the matrix, and reflect the degree to which the matrix can restrain either the flexure of locally misaligned fibers, or the shear displacement of non-axial cross-plied fibers in more complex composite lay-ups. THE DIFFUSION OF LEAD TOWARD THE INTERFACE OF A RAPIDLY SOLIDIFIED CARBON FIBER REINFORCED ALUMINUM-LEAD MATRIX COMPOSITE Ph.D. Thesis
Eric Roger Murray 1992 299 p
Avail: Univ. Microfilms Order No. DA9300785

The controlled precipitation of lead from a supersaturated aluminum-lead alloy was investigated as a means of controlling interface properties in

aluminum/carbon fiber metal matrix composite. To this end, carbon fiber reinforced aluminum-lead metal matrix composites were produced using three techniques, namely, hot pressing (diffusion bonding), single-roller rapid solidification processing, and double-roller rapid solidification processing. Composites formed by hot pressing fibers between strips of rapidly solidified aluminum-lead ribbon showed lead precipitation at the fiber/matrix interface when examined in cross-section with energy Dispersive X-ray Spectroscopy. Single-roller rapid solidification of composites was carried out by attaching fibers to a single rotating chill surface upon which a molten aluminum-lead solution would be ejected. Such rapidly solidified composite ribbons contained only a very few fibers, due to poor wetting of the fibers by the melt. Wavelength Dispersive X-ray Spectroscopy showed that the precipitation of lead was suppressed. Subsequent thermal annealing could, however, initiate precipitation. To increase the volume fraction of fibers, an apparatus with two contacting chill surfaces was constructed. Composites produced with it included more fibers than those produced with the single-surface apparatus, while still suppressing the precipitation of lead. Thermal processing of these composites was investigated as a means of increasing the amount of lead at the fiber/matrix interface in a controlled manner. The lead concentration at the interface was found to increase, but the increase did not continue with further thermal processing. Indentation tests on composite cross-sections showed some improvement in the fiber/matrix bond as a result of this thermal processing, compared to the composite as prepared. Dissolution of the matrix material showed that the lead coating on the fiber is not uniform. Modeling of precipitation using a numerical solution of Ham's diffusion theory was carried out. It showed that if lead precipitation at the fiber/matrix interface was fed by migration of lead toward the fiber, then the region from which the lead was drawn must be small, much less than 75 microns in radius. Dissert. Abstr.

APPROXIMATING THE STRESS FIELD WITHIN THE UNIT CELL OF A FABRIC REINFORCED COMPOSITE USING REPLACEMENT ELEMENTS
Final Report
R. L. Foye Feb. 1993 134 p
(Contract NAS1-19000; RTOP 505-63-50-04)
(NASA-CR-191422; NAS 1.26:191422) Avail: CASI HC A07/MF A02

This report concerns the prediction of the elastic moduli and the internal stresses within the unit cell of a fabric reinforced composite. In the proposed analysis no restrictions or assumptions are necessary concerning yarn or tow cross-sectional shapes or paths through the unit cell but the unit cell itself must be a right hexagonal parallelepiped. All the unit cell dimensions are assumed to be small with respect to the thickness of the composite structure that it models. The finite element analysis of a unit cell is usually complicated by the mesh generation problems and the non-standard, adjacent-cell boundary conditions. This analysis avoids these problems through the use of preprogrammed boundary conditions and replacement materials (or elements). With replacement elements it is not necessary to match all the constitutional material interfaces with finite element boundaries. Simple brick-shaped elements can be used to model the unit cell structure. The analysis predicts the elastic constants and the average stresses within each constituent material of each brick element. The application and results of this analysis are demonstrated through several example problems which include a number of composite microstructures. Author

A symposium on airframe materials focused on the joining and bonding of airframe materials and the manufacturing, testing, and process modelling of composite materials for aerospace applications. Papers were presented on aluminum alloys and laminates, impact tests, failure predictions for adhesively bonded polymeric composites, joint failures resulting in aircraft accidents, composite structure manufacturing, consolidation of high performance thermoplastic tape, impact properties of composite materials, materials testing programs, and process modelling of filament winding. Separate abstracts have been prepared for 13 papers from this symposium. For individual titles, see N93-23936 through N93-23948.

The alloy design considerations for an alloy intended for space launch systems are discussed in detail. Such an alloy requires a variety of properties such as good weldability, high strength and toughness at ambient and cryogenic temperatures, low density, and for certain applications, a strong natural aging response. An ultra high strength Al-Cu-Li space alloy has been designed which has met or exceeded its design goals, exceeding over 700 megapascals tensile strength in artificially aged conditions, 590 megapascals tensile strength in naturally aged conditions without cold work, high strength at 77 K, and 340 megapascals fusion weldment strength at room temperature. Alloying additions of Ag + Mg were successful in stimulating precipitation at several tempers. The properties of the early extrusions of the alloy are presented which display excellent reproducibility, a quality critical for successful alloy development. In addition, a refinement in composition (decreasing Cu content) to improve toughness without impairing weldability is introduced. The alloy is being commercialized under the trade name Weldalite 049, and has been registered in two variants, X2094 and X2095. Author (CISTI)

An investigation was conducted to study the effects of gas metal-arc welding properties of plate and extrusions of alloy 6013, an aluminum alloy with 1 percent Cu that develops high strength and excellent toughness. Mechanical and corrosion properties of the gas metal-arc welds were determined and compared to those of welds made with alloy 6061, another aluminum alloy commonly used in welded fabrications. A comparison of tensile, yield, and elongation properties showed the as-welded tensile strength of 6013 welded with 4043 filler to be 35 megapascals higher than 6061 and yield strength 28 megapascals higher. Elongations were approximately the same, 7 percent. Weld properties of re-solution heat treated and aged 6013 were almost restored to the original tensile and yield strengths and elongation of the base materials. Corrosion resistance test results indicate base material and welds in 6013 to be similar in behavior to 6061. Author (CISTI)

Fiber metal laminates offer a combination of improved strength and fatigue properties together with reduced density, indicating good potential for application in the aerospace industry. These laminates are a hybrid material composed of alternating layers of high-strength aluminum alloy sheet and fiber reinforced epoxy adhesive. During manufacture, the properties of these materials can be modified by varying fiber-resin systems, aluminum alloy and sheet gauge, stacking sequence, fiber orientation, surface

preparation techniques, and degree of post stretching. The characteristics of two series of fiber metal laminates are presented: ARALL aramid fiber-metal laminates which are unidirectionally reinforced for use in applications where the stress field is primarily unidirectional; and GLARE glass fiber-metal laminates, available in unidirectional or cross-ply configurations. Residual strength, durability, impact strength, and workshop properties are described. The main advantage of these laminates is their ability to impede and self-arrest crack growth, in contrast to monolithic aluminum sheet. In addition, significant weight savings can be obtained when substituting the laminates for aluminum sheet in such applications as fuselage skin, cargo doors, and wing components. Author (CISTI)

An experimental methodology is described for determining the impact resistance of adhesively bonded lap joints in tension. The test configuration is versatile and reduces many of the inaccuracies associated with transient impact load measurements. It allows easy assembly of various joint configurations, especially those with thick adherents. The test apparatus is a modified version of an existing drop-weight impact machine, having a specially designed rig to hold a single lap joint specimen. The apparatus is provided with a high-speed data acquisition system for obtaining a complete load-time history experienced by the specimen to the point of failure. Results are presented for tests conducted on adhesively bonded aluminum alloy specimens. A load-time curve was obtained which provided circumstantial support for a cohesive failure mechanism, substantiated by results of an extensive post-fracture examination. Author (CISTI)

An analytical approach is presented for the calculation of the energy release rate and its mode components for an arbitrarily loaded planar adhesive joint. By using the path indepedendent J-integral, the energy release rate and its mode components are expressed in terms of adherend reactions so that in many cases no explicit knowledge of the adhesive stresses is required. Experiments were conducted with cracked lap shear joint specimens of different adherend thicknesses subjected to a variety of loading conditions. The data showed that crack propagation in precracked specimens occurred at a critical energy release rate as calculated by the developed formulas, for a given mode ratio and bondline thickness. The data also showed that by treating uncracked specimens as being cracked, where a fictitious crack tip is assumed to coincide with the location of the fillet, a conservative estimate of the failure load is obtained. Three case studies are presented which address the use of mechanical fasteners, adhesive bonding, and welding to form joints in aircraft materials and components. The cases demonstrate the severe consequences of a joint failure and how prevention might have been achieved through better quality control. The first case involved a Piper Aircraft crash following an engine power loss caused by a blocked air flow to the engine. The carburetor air valve had detached from the actuator shaft due to wear and failure of rivets attaching the valve to the shaft. In the second case, a Bell Helicopter lost control on liftoff due to separation of a tail rotor drive shaft from its coupling adapter. The separation was attributed to in-flight debonding of adhesive holding the shaft components together. The third case involved failure of the main rotor transmission output shaft in a Hughes Helicopter. The failure was attributed to fatigue in the upper disc of the shaft due to the presence of a metallurgical stress concentration caused by electron weld beam impingement on the inner surface of the disc. One of the major present challenges for composite materials is the development of manufacturing technology in which composite structures can be reliably mass produced at reasonable cost. Many existing processes are labor intensive, where the quality of the part depends partly on the skill of the craftsman. In this presentation, applications of automated manufacturing processes for continuous fiber composite structures (robotic and conventional filament winding, triaxial and three dimensional braiding, tape placement, pultrusion, and hybrid processes) are described. The important manufacturing parameters, critical issues, and future trends for selected processes are discussed. Author (CISTI)

A REVIEW OF DESIGN AND MANUFACTURING METHODOLOGIES FOR STIFFENED COMPOSITE PANELS USED IN AIRCRAFT **c05**

F. Elaldi, S. Lee, and R. F. Scott *In* National Research Council of Canada, Airframe Materials Jul. 1991 p 103-125 (For primary document see N93-23935 08-24)

Copyright Avail: Canadian Inst. of Mining, Metallurgy and Petroleum, Xerox Tower 1210, 3400 de Maisonneuve Blvd., Montreal, Canada, H3Z 3B8

Stiffened panels used in aircraft structures typically consist of sheets having stiffeners attached and are designed to provide additional stiffness in the direction of primary loading. Lower weight and improved performance of such panels may be achieved by using composite materials in their construction. Design concepts for such panels are discussed, including buckle resistant and post-buckled designs, stiffener configuration, and stiffener-skin attachment design. Design parameters relevant to aircraft structures are evaluated, including load conditions, design of laminate (number of plies and their orientation), spacing between stiffeners, and allowable strain. Eleven computer codes that can be used in the design and analysis of composite stiffened panels are reviewed. For manufacturing these panels, tooling and fabrication are considered to be critical. Current manufacturing approaches focus on cocuring, where the skin and the siffener are cured together in a single autoclave cure, and secondary bonding, where stiffener and skin are cured separately then bonded together. In a review of these approaches, only compression and shear loadings are addressed since they are considered to be the most critical. Author (CISTI)

Preliminary results are presented from an experimental investigation of the consolidation of carbon fiber reinforced polyether etherketone tape. Energy from a stationary CO2 laser was used as the focused heat source to melt the matrix material for subsequent consolidation. Processing parameters such as scanning width, frequency and power of the laser pulses, and the travelling speed of the tape were investigated. Qualitative evaluation of the degree of consolidation was conducted by examining cross sectional micrographs. Results indicate that the tape could be successfully consolidated under certain processing conditions. Laser power of 60, 70, and 80 watts combined with respective consolidation speeds of 2.5, 3.4, and 4.2 cm/s produced the best results. Author (CISTI)

Thermosetting and thermoplastic composites were impacted by an instrumented drop weight tester. X-ray analysis was used to measure the damage size and microscopic cross section observations were made to analyze the failure mechanism. Compression after impact tests were conducted to assess the residual properties (damage tolerance). Results have shown that thermoplastic composites AS4/APC-2 and IM7/APC-2 possess good damage tolerance, and IM7/APC-2, IM7/986, and T800/5250-3 have good impact resistance characteristics. In general, the toughness of the resin dominates the damage tolerance of the composite, and the impact resistance characteristic is controlled by the resin and the fiber. Author (CISTI)

Both analytical and experimental work was performed to investigate the damage in laminated composites due to low velocity impact. A model has been developed for predicting the initial damage and the extent of multiple delaminations in composites due to impact. Experiments were also conducted on T300/976 composites. The results of embedded impact damage in composites were examined by X-ray and C-Scan machines. Numerical calculations based on the model were performed to simulate the test conditions. Overall, the predictions were fairly consistent with the test results. Author (CISTI)

A PROCESS MODEL FOR CONTROL OF RESIN VOLUME FRACTION IN FILAMENT WOUND COMPOSITE LAMINATES
B. Hlavacek, S. N. Sirosh, and S. L. McKay *In* National Research Council of Canada, Airframe Materials Jul. 1991 p 155-167 (For primary document see N93-23935 08-24)
Copyright Avail: Canadian Inst. of Mining, Metallurgy and Petroleum, Xerox Tower 1210, 3400 de Maisonneuve Blvd., Montreal, Canada, H3Z 3B8

A process model has been developed to predict the amount of resin carried by a fiber in wet filament winding applications. The model is based on incorporating the surface tension effect into the Navier-Stokes equilibrium equation to predict the thickness of film that remains on the surface of a solid withdrawn from a quiescent liquid. From the resulting partial differential equations, expressions defining the thickness of liquid film adhering to the fiber and in turn the resin to fiber volume ratio are derived. The process model enables optimization of the winding speed and resin viscosity to achieve the required fiber volume fraction. Optimal resin content is important for high specific strength and stiffness, long fatigue life, and low environmental degradation. The wetting theory is examined along with its correspondence to experimental data. The relevance of the process model results to practical applications is discussed. The derived relationships suggest that for typical filament winding resins, a transition from resin transport through a wetting hydrodynamic process to a predominantly dragging process occurs during the fiber velocity interval from 0.04 to 0.4 m/s. Due to demanding requirements imposed on current and future high-performance aerospace structures, advanced materials are being developed for and used in a variety of aircraft/aerospace applications. Production costs for advanced materials are generally higher and the payback will be greater for data leading to faster decision making or improvement in the product. The development and qualification of new materials and joining and manufacturing processes for advanced aircraft/aerospace applications is accelerated by the availability of quantifiable data on design characteristics and their variations. X-ray computed tomography (CT) provides quantitative measurements of material characteristics in terms of the dimensions, density, and composition. The sensitivity of CT is dependent upon a number of factors including the test article and the CT system technology employed. The evaluation capability of CT overcomes the limitation of current qualitative inspection techniques to provide an objective measure of material or component condition. The results of studies involving CT testing of various advanced materials, manufacturing processes, and joining methods revealed four specific areas in which there is potential for significant economic benefit from CT. These areas are new product development, process control, noninvasive micrography, and material performance prediction. GRA

Net forming processes are under development to allow affordable production of intermetallic components. Powder injection molding (PIM) mav be employed for the production of complex-shaped intermetallic geometries. Proper choice of powder parameters and processing conditions can lead to the formation of fully dense structures through pressure-less sintering. In this study, Ni3Al with 0.04 wt.-percent boron has been successfully injection molded and sintered to full density. A yield strength of 340 MPa, ultimate tensile strength (UTS) of 591 MPa, and 8 percent elongation were attained for injection molded and sintered tensile bars. Powder characteristics and sintering behavior are given for the nickel

aluminide employed in this study to highlight the powder attributes needed for injection molding. Molding parameters, debinding and sintering schedules, along with mechanical properties are presented to indicate the viability of PIM for intermetallics. This approach based on the understanding of key powder characteristics and use of the reactive synthesis powder process may be extended to the successful injection molding of other intermetallic systems. EFFECT OF HIGH-TEMPERATURE LOADING ON MECHANICAL PROPERTIES OF NICALON FIBERS AND NICALON FIBER/SiC MATRIX COMPOSITES

D. Singh and J. P. Singh Jan. 1993 21 p Presented at the 17th Annual Conference on Composites and Advanced Ceramics, Cocoa Beach, FL, 11-15 Jan. 1993

(Contract W-31-109-eng-38)

(DE93-006420; ANL/MCT/CP-76993; CONF-930164-3) Avail: CASI HC A03/MF A01

Results of an investigation into the effect of elevated temperature exposure on the strength distribution of Nicalon fibers as well on mechanical properties of Nicalon/SiC composites are reported in this paper. Single-fiber strength distribution of as-fabricated Nicalon fibers was obtained from bundle tests. Strength distributions of fractured fibers in as-fabricated Nicalon/SiC composites and after elevated temperature exposure of composites were assessed from measurements of fracture mirror radii. Variations in the mechanical properties of composites evaluated as a function of test temperatures are compared with those evaluated at room temperature and are correlated to the fiber strength characteristics. Limited tests were also conducted to investigate the effect of long term exposure at elevated temperatures on composite ultimate strength. DOE

HIGH TEMPERATURE DEFORMATION CHARACTERISTICS OF DISCONTINUOUS FIBER REINFORCED COMPOSITES

S. B. Biner 1992 7 p Presented at the International Conference on Advanced Composites 1993, Wollongoup, Australia, 15-19 Feb. 1993

(Contract W-7405-eng-82)

(DE93-004466; IS-M-735; CONF-930246-1) Avail: CASI HC A02/MF A01

Role of the geometrical parameters of the fibers and effects of fiber distribution in the matrix on the creep deformation behavior of 20 percent discontinuous fiber reinforced composite were numerically investigated, including the debonding and fiber pull-out mechanisms. During the analyses in the composite it is assumed that the matrix deforms with a power law creep relationship and the fibers are rigid. Results indicate that for a given fiber geometry and distribution parameters in the matrix, an increase in the interfacial strength or an increase in the work of separation per unit area of interface reduces the secondary creep rates. For even very weak interface characteristics, it is possible to achieve lower secondary creep rates and delayed interface failure by suitable selection of the geometrical parameters of the fibers and by controlling the distribution of the fibers in the matrix. VISCOELASTIC PROPERTIES OF 3-D BRAIDED PEEK/GRAPHITE COMPOSITES Ph.D. Thesis

Jia-Ni Chu 1992 158 p

Avail: Univ. Microfilms Order No. DA9305293

Three-dimensional braided PEEK/AS4 graphite composites were preformed and processed to investigate the viscoelastic behavior of this new system. These manufactured composites were characterized to determine their fiber volume fractions and matrix crystallinity indices using matrix digestion and wide angle x-ray diffraction. After physical characterization, the mechanical response of these composites was evaluated at various temperatures. Experimental results from tensile measurements were compared to an established fabric geometry model (FGM). This model predicts tensile modulus based upon fiber and matrix properties, fiber volume fraction, and braiding angle. Model predictions and experimental results are given and are in good agreement with each other. In order to study the time-dependent mechanical properties of these 3-D braided composites, their stress relaxation, creep and dynamic mechanical properties were evaluated. These results were then compared to a new composite model. This model combined a Quasi-linear Viscoelastic Model (QVM) for the viscoelastic behavior of PEEK with the FGM approach to predict the viscoelastic behavior of 3-D PEEK composites. The experimental stress relaxation and creep results are in good agreement with the QVM-FGM analysis. Thus, the QVM-FGM approach was used to accurately correlate these viscoelastic properties of 3-D braided PEEK/graphite composites. Through wider use and testing, this QVM-FGM approach may be used to increase our understanding and perhaps facilitate the design of composite structures. Dissert. Abstr.

EFFECT OF REINFORCEMENT AND FIBER-MATRIX INTERFACE ON DYNAMIC FRACTURE OF FIBER-REINFORCED COMPOSITE MATERIALS Ph.D. Thesis

Sanjeev Kumar Khanna 1992 173 p

Avail: Univ. Microfilms Order No. DA9239568

The experimental technique of dynamic photoelasticity coupled with high speed photography was used to study the interaction of running cracks with brittle and ductile fibers embedded in a brittle polymeric matrix. The effect of reinforcement and the fiber-matrix interface on dynamic stress intensity factor, crack bridging phenomena, crack surface morphology, and toughening mechanisms occurring during dynamic fracturing of reinforced brittle matrix composites was investigated. It is found that reinforcement reduces the crack velocity and the stress intensity factor. Thus the energy supplied to the crack tip is reduced resulting in reduction of the crack jump distance. Fiber pullout experiments were done to characterize the fiber-matrix interface. Rapid pullout results in an increase in interface shear strength. For rapid pullout of fibers the difference between maximum pullout loads, for well and weakly bonded fibers, is much smaller than for very slow pullout. A fiber-matrix interface which is weaker in the vicinity of the crack path, termed the partly debonded interface, produces higher crack closing forces and lower stress intensity factor compared to well bonded fibers. The former interface condition results in low fracture energy and shorter crack jump compared to the later. The interface condition significantly affects the fracture surface morphology. The fracture surface roughness is lower for reinforced materials compared to monolithic. Further the partly debonded fibers result in lower surface roughness compared to the well bonded fibers. Inclined fibers with various interface conditions have no significant effect on the stress intensity factor. The fiber debonded length, however, decreases, as compared to fibers which are aligned with the loading direction, due to the kinking of the fibers. The dynamic stress field and strain field equations developed for orthotropic composite materials were used to determine the stress intensity factor for running cracks in a high fiber volume fraction glass-epoxy composite laminate, using the method of strain gages. The determination of the optimum location and orientation of the strain gages is described. Dissert. Abstr.

MODELING THE THERMAL PROPERTIES AND PROCESSING OF COMPOSITE MATERIALS Ph.D. Thesis

Rangarajan Pitchumani 1992 120 p

Avail: Univ. Microfilms Order No. DA9238826

The manufacture of partially cured, thermoset matrix composite systems is modeled. A generalized analysis, applicable to almost all the fiber-resin systems encountered in practice, is carried out in terms of four key dimensionless groups formed of the process and the product parameters - (1) the Damkohler number (K(sub o)) which is a relative measure of the conduction and the reaction time scales, (2) the dimensionless activation energy (E(sub o)), (3) the adiabatic reaction temperature (B(sub o)) which represents the temperature rise potential in the composite due to the heat of the cure reaction, and (4) the Biot number (B(sub i)) which characterizes

the post-cure convective cooling of the composite product. Optimal cure cycles which yield a homogeneous cure in the composite, are obtained as a function of the dimensionless parameters. Design plots for the optimal cure temperature and duration are presented. Their use in practical situations is illustrated in the context of a commercially available graphite-epoxy prepreg from Hercules, which is widely used in the aerospace industry. The thermal properties of the composite namely, the transient thermal diffusivity and the steady state thermal conductivity, are essential parameters in the process modeling studies, as well for the design of composite materials for several high temperature applications. Transient heat conduction in fibrous composites is investigated with the aim of devising a criterion for the validity of the analysis of composite materials as homogeneous media having the effective thermal properties. A homogeneity criterion based on the composite thickness is derived in terms of the fiber volume fraction and the fiber diameter. The criterion, which is the first of its kind for fibrous composites, is valid in the practical range of composite parameters. An analytical means for evaluating the effective thermal diffusivity is also presented. Steady state heat conduction in both fiber-reinforced composites as well as particulate reinforced extruded composites is addressed. In the case of fibrous composites, an approach to estimating the thermal conductivity of systems having ordered or disordered arrangement of fibers is proposed. This analytical approach uses local fractal techniques to reduce the geometric complexity of the fiber arrangements and correlates a given fiber geometry to the effective thermal conductivity. The method is shown to be powerful in predicting the composite conductivities in real-world situations. In the case of three-dimensional particulate reinforced composites, a simplified model is developed for predicting the anisotropic composite conductivities. The model exploits the microstructural information available from scanning electron microscopy, and is based on the concept of a unit cell. Good agreement is demonstrated between the theoretical model-predictions and experimental data obtained using eddy current techniques, for a wide range of composite systems and reinforcement volume fractions. TIME-TEMPERATURE ANALYSIS OF DAMAGE INITIATION AND GROWTH IN COMPOSITE LAMINATES Ph.D. Thesis
Suresh Nagesh 1992 137 p
Avail: Univ. Microfilms Order No. DA9237891

Polymer-based composites are used in aerospace structures due to their high strength to weight ratio. However, polymers also exhibit time-dependent behavior and this behavior may in turn be affected by high temperature and humid environments. Long-term effects manifest themselves in the form of loss of stiffness and/or strength. And, in this regard, the contributing factors could stem from the time-dependent material behavior as well as the accumulation of damages in time. Clearly, a generic methodology is needed which addresses the fundamental issues caused by both of the contributing factors. The objective of the present study is to investigate the time-dependent damage initiation and growth behavior associated with the various sublaminate damage modes in polymer-based composites. A quasi-three dimensional finite element procedure is first developed based on the linear theory of viscoelasticity for simulating sublaminate damages in composite laminates. Specifically the unidirectional plies of the laminate are represented by a set of linear anisotropic, viscoelastic constitutive relations. Damage modes in the forms of transverse cracks, delamination, or fiber-wise splitting are incorporated in the analysis by means of appropriately evolving local boundary conditions. Calculation of the stress fields and fracture parameters such as the strain energy release rates (G) and the stress intensity factors (K) associated with the different modes of damage and at different stages of evolution are also made a part of the routine. Numerical solutions are obtained by a convolution as well as a quasi-elastic technique. To illustrate the applicability of the numerical routine, the problem of fiber-wise splitting is chosen. Since fiber-wise splitting is a mixed-mode type of failure, an appropriate mixed-mode fracture criterion is needed for predicting its onset and growth. An effort is then made to develop such a criteria, based on experimental data using several aerospace grade graphite-epoxy composite systems. The finite element procedure in conjunction with the fracture criterion is then used to simulate fiber-wise splitting experiments that were conducted previously. Good correlation between the predicted results and the experimental results was obtained. Dissert. Abstr.

A key objective of the ONR-URI Center is to conduct basic research on critical materials science, mechanics, and structural problems currently confronting the Navy and to be encountered in its future use of advanced composite materials. The current emphasis of the Center's research thrust is placed on thick-section structural composites and composite structures, since these subjects have been identified as major potential problem areas of concern in the present and future high-performance Navy structural systems. The research program had three major thrusts, namely: (1) Materials design and selection. (2) Processing of thick filament would cylinders. (3) Mechanical behavior of thick section composites. GRA

MESOMECHANICAL MODEL FOR FIBRE COMPOSITES: THE ROLE OF THE INTERFACE Final Report, 1 Jun. 1989 - 31 May 1992
Michael R. Piggott 31 Jul. 1992 44 p
(Grant AF-AFOSR-0365-89)
(AD-A260195; AFOSR-93-0017TR) Avail: CASI HC A03/MF A01

This work was initially conceived as providing a theoretical framework linking microphenomena and macroscale properties in fiber composites. In addition, experimental data were to be obtained to lend substance to the theoretical constructs. Experiments were therefore carried out on the interface, and on composites which were particularly sensitive to interfacial effects, i.e., those containing short aligned fibers. Pull out tests were used for interface studies. These showed that most fiber-polymer interphases were strong (usually stronger than the polymer) and brittle. This brittleness was an important observation which goes a long way towards explaining the properties of fiber composites containing many fiber ends. Short aligned fiber composites were manufactured, with carbon fibers having lengths of 0.5, 1.0, 2.0 and 4.0 mm. Alignment was not perfect, nor were fiber lengths all equal to the nominal lengths, so both alignments and lengths were checked in the actual composites. Composite strengths and Young's moduli were measured and compared with predictions based on slip and shear lag theory. The agreement for moduli was moderately good, but for strengths it was very poor. Since, in addition, the stress strain plots were straight, the slip theory is not supported at all by this work. Instead, it appears highly likely that a mesomechanical theory involving crack initiation and development would work much better. Theoretical development led to the concept of the mesostructure as a basis for mesomechanical analysis. The mesostructure was defined as adventitious small-scale structures which are present in fiber composites, but normally neglected, such as fiber waviness and uneven packing. GRA

A pultrusion machine employing a corrugated impregnator vessel to immerse multiple, continuous strand, fiber tow in an impregnating material, and an adjustable metered exit orifice for the impregnator vessel to control the quantity of impregnating material retained by the impregnated fibers, is provided. An adjustable height insert retains transverse rod elements within each depression of the corrugated vessel to maintain the individual fiber tows spread and in contact with the vessel bottom. A series of elongated heating dies, transversely disposed on the pultrusion machine and having flat heating surfaces with radiused edges, ensure adequate temperature exposed dwell time and exert adequate pressure on the impregnated fiber tows, to provide the desired thickness and fiber/resin ratio in the prepreg

formed. The prepreg passing through the pulling mechanism is wound on a suitable take-up spool for subsequent use. A formula is derived for determining the cross sectional area opening of the metering device. A modification in the heating die system employs a heated nip roller in lieu of one of the pressure applying flat dies.

A metal matrix composite (MMC) for potential aerospace applications was studied. The MMC was composed of silicon carbide whiskers (SiC(w)) and a new aluminum powder alloy specifically designed as a matrix for SiC particulate reinforced metal matrix composites (Alcoa 2080). The new alloy was reinforced with 30 percent by weight of SiC(w), using knowledge previously acquired with the powder processing of MMC's using aluminum alloy 7050. A microstructural analysis of the 2080 powder and the SiC(w) was carried out, and a series of experiments was designed to determine the effects of processing parameters on the quality of the bonding and the mechanical properties. The effects of incipient melting at particle boundaries during hot isostatic pressing were studied in particular, in contrast with the conventional solid state consolidation. A technique was successfully developed to produce a uniform distribution of SiC(w) in the matrix without clustering of the whiskers. The hot isostatically pressed unreinforced alloy was successfully extruded with a ratio of 16:1. However, the high strength of the composite has so far prevented extrusion even at temperatures exceeding those normally used for hot working. Author (CISTI)

A method for pretreating a cellulosic waste product with microwaves is disclosed as well as a method and apparatus for converting cellulosic waste into soluble saccharides. The invention greatly enhances a reaction rate for enzymatic hydrolysis. A feed mixture of cellulose, water, and acetic acid are irradiated with microwaves at a superatmospheric pressure in an autoclave reaction vessel and the treated cellulose is enzymatically hydrolyzed in a bioreactor. The acid and enzymes are optionally separated for reuse. As a feed stock for the culture of microbes, the sugars can be further processed into ethanol, or food protein. High yield, low hazard potential, low energy usage, and ready preparation in space of acetic acid and the enzyme makes the present invention well suited for use on long duration space missions.

Numerous fluids have been identified as promising alternative refrigerants, but much of the information needed to predict their behavior as pure fluids and as components in mixtures does not exist. In particular, reliable thermophysical properties data and models are needed to predict the performance of the new refrigerants in heating and cooling equipment, and to design and optimize equipment to be reliable and energy efficient. Objective of this project is to provide highly accurate, selected thermophysical properties data for Refrigerants 32, 123, 124, and 125, and to use these data to fit simple and complex equations of state and detailed transport property models. The new data fills gaps in the existing data sets and resolve the problems and uncertainties that exist in and between the data sets. The progress made during the third quarter of this fifteen-month project, which was initiated in late Jan. 1992 is described. DOE

Hydrogen catalytic combustors are advantageous because they release heat at lower temperatures than flame combustors. Low operation temperature and flameless burning make the process safe. The combustion temperature can be controlled continuously by changing the hydrogen flow rate. The combustion gas of a hydrogen catalytic combustor is water vapour, and if it is burned with air, certain amounts of nitrogen oxides may also occur. Commercial applications are in the area of gas monitors for combustible gases. Applications for hydrogen catalytic combustion are predicted to increase in household heaters, cooking devices, and industrial drying and heating processes. Further research of hydrogen catalytic combustors is concerned with increasing their power and reliability. The literature review of this report describes catalytic combustion and specifically hydrogen catalytic combustion. The construction of hydrogen catalytic combustors and different catalytic materials are explained. Some examples of commercial or near commercial applications are shown. An experimental construction was built to run a 50W open catalytic combustor. The maximum operating temperature of 164 C was reached with hydrogen flow rate 15 l/h. The temperature was easily controlled by changing the hydrogen flow rate. The combustion efficiency reached in these tests was 95 percent. DOE

The ability to measure the electrophoretic mobility (EM) of solid particles in a repeatable manner is critically important in the specification of ceramic powders for advanced heat engines. A joint research project conducted by ORNL, Rutgers University, the University of Florida, and the University of Wisconsin to standardize EM measurements has been completed. Its purpose was to define the procedures by which repeatable, inter-laboratory, capillary microelectrophoretic mobility, and pH measurements could be made on ceramic powders in aqueous suspension. Both 'model' colloids and silicon nitride ceramic powder were evaluated. 'Model' systems were considered as potential standards for the initial calibration and check-out of mobility measurements at the four laboratories. These included surface-treated and unmodified polymer lattices, phosphated goethite, and red blood cells. The results indicate that phosphated goethite is the best standard material. The suspensions were stable for many months; they were easy to measure; and, their zero-mobility pH's were predictable based on the phosphate addition level. Interlaboratory agreement of mobility vs pH was excellent. Following the work on goethite, a study of the mobility of silicon nitride was conducted. This work showed that repeatable interlaboratory measurements could be made on silicon nitride, a ceramic system that exhibits significant aging in aqueous suspension. Lessons learned from the goethite experience were invaluable in conducting the measurements on silicon nitride. DOE

The objective is to address the keys to understanding the relation between surface structure and catalytic activity/selectivity. Of concern are questions related to enhanced catalytic properties of mixed-metal catalysts and critical active site requirements for molecular synthesis and rearrangement. The experimental approach utilizes a microcatalytic reactor contiguous to a surface analysis system, an arrangement which allows in vacuo transfer of the catalyst from one chamber to the other. Surface techniques being used include Auger (AES), UV and X-ray photoemission spectroscopy (UPS and XPS), temperature programmed desorption (TPD), low energy electron diffraction (LEED), high resolution electron energy loss spectroscopy (HREELS), and infrared reflection-absorption spectroscopy (IRAS). Our research program builds upon our previous experience relating the results of single crystal kinetic measurements with the results obtained with supported analogs. We are also exploiting our recent work on the preparation, the characterization, and the determination of the catalytic properties of ultra-thin metal and metal oxide films. The program is proceeding toward the following studies: the unique catalytic properties of ultrathin metal films; the investigation of the critical ensemble size requirements for principal catalytic reaction types; and the modelling of supported catalysts using ultra-thin planar oxide surfaces. METHANE OXIDATION OVER DUAL REDOX CATALYSTS
K. Klier, R. G. Herman, Z. Sojka, J. I. DiCosimo, and S. DeTavernier Jun. 1992 135 p
(Contract DE-FG21-89MC-26039)
(DE92-012454; DOE/MC-26039/3111) Avail: CASI HC A07/MF A02

Catalytic oxidation of methane to partial oxidation products, primarily formaldehyde and C2 hydrocarbons, was found to be directed by the catalyst used. In this project, it was discovered that a moderate oxidative coupling catalyst for C2 hydrocarbons, zinc oxide, is modified by addition of small amounts of Cu and Fe dopants to yield fair yields of formaldehyde. A similar effect was observed with Cu/Sn/ZnO catalysts, and the presence of a redox Lewis acid, Fe(sup 3) or Sn(sup 4), was found to be essential for the selectivity switch from C2 coupling products to formaldehyde. The principle of double doping with an oxygen activator (Cu) and the redox Lewis acid (Fe, Sn) was pursued further by synthesizing and testing the CuFe-ZSM-5 zeolite catalyst. The Cu(sup 2)(ion exchanged) Fe(sup 3)(framework)-ZSM-5 also displayed activity for formaldehyde synthesis, with space time yields exceeding 100 g/h-kg catalyst. However, the selectivity was low and earlier claims in the literature of selective oxidation of methane to methanol over CuFe-ZSM-5 were not reproduced. A new active and selective catalytic system (M = Sb,Bi,Sn)/SrO/La2O3 has been discovered for potentially commercially attractive process for the conversion of methane to C2 hydrocarbons, a new principle has been demonstrated for selectivity switching from C2 hydrocarbon products to formaldehyde in methane

oxidations over Cu,Fe-doped zinc oxide and ZSM-5, and a new approach has been initiated for using ultrafine metal dispersions for low temperature activation of methane for selective conversions. DOE

SCATTERING IN ELECTRON SPECTROMETERS, DIAGNOSIS, AND AVOIDANCE. 1: CONCENTRIC HEMISPHERICAL ANALYSERS

M. P. Seah Jul. 1992 23 p

(NPL-DMM(A)-70; ETN-93-93548) Copyright Avail: National Physical Lab., Teddington, Middlesex, TW11 0LW, England

Part of a study developing three methods to analyze the extent to which unwanted scattering of electrons occurs in electron spectrometers and how to reduce it to an insignificant level is presented. The three diagnostic methods involve the measurement of either: the region of the M(sub 4,5) VV Auger Electron (AE) peaks from Ag in AES (AE Spectroscopy); the reflection of an electron beam from a biased sample; or the 3d(sub 1/2) photoelectron peak from Ag irradiated with MgK(alpha) x-rays. Analyses were made for concentric hemispherical analyzers. Scattering contributions appear to arise from high energy electrons which strike the outer hemisphere giving rise to a spectrum of secondary electrons. These cause the scattered electron contribution to vary approximately as Ep(exp -2.43), where Ep is the pass energy, to increase approximately in proportion to the spectrometer input slit area for AES studies, to fall approximately inversely with an increase in the lens magnification from 1 to 3, and in the constant Delta(E) mode, to increase with the analyzed electron energy. Thus, for each lens magnification, there exists a range of slits and pass energies for which the scattering may be maintained at less than 1 percent. In the constant Delta (E) mode, pass energies of 50 eV or more are generally safe whereas, in the constant Delta(E)/E mode, retardation ratios of 4 or less are required. ESA

SCATTERING IN ELECTRON SPECTROMETERS, DIAGNOSIS, AND AVOIDANCE. 2: CYLINDRICAL MIRROR ANALYSERS

M. P. Seah Jul. 1992 29 p

(NPL-DMM(A)-71; ETN-93-93549) Copyright Avail: National Physical Lab., Teddington, Middlesex, TW11 0LW, England

An analysis of the effects leading to an unwanted scattered background of electrons in Cylindrical Mirror Analyzers (CAM's) is presented as a complement to part 1 on concentric hemispherical analyzers. Scattering from the middle region of the inert surface of the mirror electrode is shown to be significant but the amount of scattering reaching the detector may be reduced by reducing the area of the output slit or by adding a deflection post filter to the optics as occurs in some commercial instruments. Internal scattering causes a higher background so that peak to background ratios are attenuated and so that transmission function calibrations involve a systemetic error. Evidence for this error is a step in the calibration curves for I(E)/En(E) established earlier. The steps appearing in the curves for Cu and Ag reference samples give a direct measure of the scattering intensity. Calibration plots are established for this purpose. Results from previous interlaboratory comparisons are analyzed showing that in commercial CMA's with large area energy selection slits the scattering may reach 35 percent of the copper true background at 950 eV, complicating the subsequent use of the data. Concentric hemispherical analyzers and some commercial CMA's show very low scattering. In some CMA's, the analog detection systems also cause an enhanced background similar and in addition to scattering, boosting the above figure of 35 to 100 percent. ESA

POROUS MATERIALS BY DESIGN. PLASMA OXIDATION OF HYDROCARBON TEMPLATES IN POLYSILSESQUIOXANES

D. A. Loy, R. J. Buss, R. A. Assink, K. J. Shea (California Univ., Irvine.), and H. Oviatt (California Univ., Irvine.) 1992 10 p Presented at the 205th American Chemical Society National Meeting, Denver, CO, 28 Mar. - 2 Apr. 1993. - 2 Apr. 1993

(Contract DE-AC04-76DP-00789)

(DE93-005372; SAND-92-2522C; CONF-930304-1) Avail: CASI HC A02/MF A01

Arylene- and alkylene-bridged polysilsesquioxanes were prepared by sol-gel processing of bis(triethoxysilyl)-aryl monomers and decyl monomer. The arylene polysilsesquioxanes were porous materials with surface areas as high as 830 m(exp 2)/g (BET). Treatment with an inductively coupled oxygen plasma resulted in the near quantitative removal of the arylene bridging groups and a coarsening of the pore structure. Solid state Si-29 NMR was used to confirm the conversion of the sesquioxane silicons (T) to silica (Q). The decylene-bridged polysilsesquioxane was a non-porous material. Oxygen plasma treatment afforded a silica gel with a surface area of 294 m(exp 2)/g and a mean pore diameter of 46 A. The porosity in the silica gel appears to arise entirely from the oxidation of the 1,10-decylene spacer. DOE

HOMOLYTIC ACTIVATION OF HYDROCARBONS AND HYDROGEN BY PERSISTENT RADICALS

1993 8 p

(Contract DE-FG02-90ER-14122)

(DE93-007013; DOE/ER-14122/1) Avail: CASI HC A02/MF A01

New synthetic methods for preparing persistent transition metal-centered radicals were developed, based on ligand addition reactions of triphenylmethyl complexes. Preliminary study indicates that they will react under mild conditions with substrates such as hydrogen and certain hydrocarbons. The chemistry was extended to biradicals. Mechanism and selectivity of the novel reactions are being studied. Extensions and modification of synthetic methods to provide addition persistent radicals are proposed; more general methodologies including the reduction of metal halides are also being developed. CONTRIBUTION TO THE STUDY OF SOOT FORMATION IN COMBUSTION ENVIRONMENTS BY OPTICAL METHODS BASED ON LIGHT DIFFUSION Ph.D. Thesis [CONTRIBUTION A L'ETUDE DE LA FORMATION DE LA SUIE DANS LES MILIEUX EN COMBUSTION PAR LES METHODES OPTIQUES BASEES SUR LA DIFFUSION DE LA LUMIERE]

Naceur Ayachi 1991 166 p In FRENCH Sponsored by Agence Francaise pour la Maitrise de l'Energie and Regie Nationale des Usines Renault

(ECL-91-26; ETN-93-91955) Avail: CASI HC A08/MF A02

A study on oxidation and soot formation in hydrocarbon combustion, to aid engine designers in defining the most adequate pollutant reduction processes and in developing soot production models for use in parametric study computation codes, is presented. The state of the art of this field is reviewed, and the morphology, crystal structure in soot particles, and the principal steps in their formation are described. Different combustion systems, in particular the diesel engine, are reviewed. The theory of light diffusion is used for characterization of the soot. The theory and applications of electromagnetic scattering are recalled. This method is used on a simple configuration of laminar diffusion flame. Applied to a diesel engine, this measurement method gives the diameter and concentration of soot particles in the combustion chamber. Light attenuation measurements can determine the mean value of the voluminal fraction over one crossing of the combustion chamber. With these measurements, the spatial and temporal distribution of the soot and the influence of inlet air temperature are studied. Wider utilization possibilities of the experimental tool are discussed. ESA

MECHANISMS AND ENHANCEMENT OF FLAME STABILIZATION

C. K. Law 1993 7 p

(Contract DE-FG02-89ER-13988)

(DE93-006467; DOE/ER-13988/5) Avail: CASI HC A02/MF A01

During the reporting period, useful contributions have been made in understanding the structure of laminar premixed and diffusion flames, with emphasis on the influence of aerodynamics and chemical kinetics. These contributions include: (1) derivation of the missing closure condition for the activation energy asymptotic analysis of premixed flames; (2) identification of a dual extinction mode for radiation-affected flames; (3) formulation of a unified theory of fundamental flammability limits; and (4) demonstration that flame stabilization can be achieved in the absence of heat loss. These investigations have been conducted via experimental, analytical and computational approaches, with strong coupling between the individual components. DOE

PHOTOCHEMICAL OBSERVATION OF ION FLOWS IN MEMBRANE CHANNELS Final Report

Michael E. Starzak 22 Dec. 1992 11 p

(AD-A259869) Avail: CASI HC A03/MF A01

Laser Doppler velocimetry is applied to a study of the synchronous motions of ions in membranes and membrane channels. The technique provides direct measurements, for example, of local velocities within gramicidin channels and these measurements can be used to elucidate the kinetic mechanism of ion flows in such channels. The laser Doppler experiments yield data which suggest that ion motions in the channel are regular, i.e. the ions move at a steady velocity with some fluctuations about this velocity due to the molecular structure of the channel. Standard electrochemical measurements give no detailed information about such motions within the channels and, because of this lack of information, many multiparameter mechanisms have been postulated to describe the intrachannel kinetics. Since the number of 'fitting' parameters is often large with respect to the available data, many models can be fitted to the data and it is extremely difficult to prove a permeation mechanism. With the detailed velocity distribution for ions in the channel, it becomes possible to differentiate the various mechanisms for ion permeation and develop a consistent mechanism for ion permeation in a specific channel. BIOLOGICAL PRODUCTION OF HYDROGEN

E. C. Clausen, J. L. Gaddy, and C. W. Ko 1992 13 p Presented at the US Department of Energy Contractors Review Meeting on Gasification and Gas Stream Cleanup Systems, Morgantown, WV, 15-17 Sep. 1992

(Contract DE-FG05-90ER-81057)

(DE93-002604; DOE/ER-81057/93/C0107; CONF-920951-15) Avail: CASI HC A03/MF A01

All Phase 1 objectives were satisfactorily achieved. Stoichiometric yields of hydrogen were obtained from CO with R. rubrum. Fast growth was observed on synthesis gas only; however, growth was maximized with a small amount of yeast extract at 30 C and pH 7. Intrinsic kinetic parameters were determined and showed that fast hydrogen production rates are possible. The Phase 2 research program concentrated on defining the optimal culture and bioreactor for hydrogen production. To insure that the best possible system was developed, cultures were screened for enzyme activity and hydrogen production. Promising cultures were optimized for hydrogen yield and CO conversion. Bioreactors that achieved high mass transfer rates, as well as high cell concentrations, were studied. Advanced bioreactor concepts, such as solid-state fermentation, non-aqueous fermentation, and high pressure fermentation were applied to these reactors to enhance mass transport. Process design and economic evaluations of the various alternatives were used to guide the research program. A new bacterial culture has been isolated from natural sources which consumes CO rapidly and gives high hydrogen yields. The new isolate, ERIH2, is able to utilize a variety of sugars as growth substrates and, unlike R. rubrum, does not require light for growth. The yield of H2 by ERIH2 was 100 percent. Typical H2 yields by R. rubrum were 75-85 percent. DOE

The structure of molten FeCl3 at 320 C has been measured with neutron diffraction at the Intense Pulsed Neutron Source. Results indicate that melting in FeCl3 is accompanied by a change in local structure from the octahedral environment of the Fe3(+) in the solid to an Fe2Cl(6) molecular liquid. This behavior is similar to that observed in AlCl3 and in contrast to that of YCl3 where an octahedral coordination is preserved on melting. DOE

GAS SEPARATION WITH GLASS MEMBRANES

D. L. Roberts, L. C. Abraham, Y. Blum, and J. D. Way May 1992 105 p

(Contract DE-AC21-88MC-25204)

(DE93-000217; DOE/MC-25204/3133) Avail: CASI HC A06/MF A02

The Department of Energy (DOE) is seeking to develop high temperature, high pressure inorganic membrane technology to perform a variety of gas separation processes to improve the efficiency and economics of advanced power generation systems such as direct coal-fueled turbines (DCFT) and the integrated gasification combined cycle process (IGCC). The temperatures encountered in these power generation systems are far above the temperature range for organic membrane materials. Inorganic materials such as ceramics are therefore the most likely membrane materials for use at high temperatures. This project focussed on silica glass fiber membranes made by PPG Industries (Pittsburgh, PA). The goals were both experimental and theoretical. The first objective was to develop a rational theory for the performance of these membranes. With existing theories as a starting point, a new theory was devised to explain the unusual 'molecular sieving' behavior exhibited by these glass membranes. An apparatus was then devised for making permeation performance measurements at conditions of interest to DOE (temperatures to 2000 F; pressures to 1000 psia). With this apparatus, gas mixtures could be made typical of coal combustion or coal gasification processes, these gases could be passed into a membrane test cell, and the separation performance determined. Data were obtained for H2/CO, N2/CO2, O2/N2, and NH3/N2 mixtures and for a variety of pure component gases (He, H2, CO2, N2, CO, and NH3). The most challenging part of the project turned out to be the

sealing of the membrane at high temperatures and pressures. An overview of the practical potential of these membranes and of inorganic membranes in general of DOE and other applications are presented. DOE

Numerous fluids have been identified as promising alternative refrigerants, but much of the information needed to predict their behavior as pure fluids and as components in mixtures does not exist. In particular, reliable thermophysical properties data and models are needed to predict the performance of the new refrigerants in heating and cooling equipment and to design and optimize equipment to be reliable and energy efficient. The objective of this project is to provide highly accurate, selected thermophysical properties data for Refrigerants 32, 123, 124, and 125, and to use these data to fit simple and complex equations of state and detailed transport property models. The new data will fill gaps in the existing data sets and resolve the problems and uncertainties that exist in and between the data sets. This report describes the progress made during the fourth quarter of this fifteen-month project, which was initiated in late January, 1992. DOE

As the Air Force continues to advance engine technology, aviation fuel heat loading has steadily increased. Therefore, a thermally stable JP-8 fuel is required that can operate at higher temperatures than current fuels. This research program had two objectives: (1) to identify fundamental conditions of fuel thermal decomposition, and (2) to provide the data needed to develop and evaluate global chemistry and heat transfer models for predicting jet fuel thermal decomposition and deposition rate. The Fuels Data Sets that may be used by modelers in the industry and other laboratories for the evaluation and refinement of global chemistry and heat transfer models for predicting jet fuel deposition rates are presented. These data were obtained using a single-pass, single-tube heat exchanger called the Phoenix rig. More exhaustive information is available in the individual papers listed. All the data sets were prepared using Microsoft Excel V.4.0 for IBM PC-Compatible computers and are available on computer diskettes. GRA

THE INFLUENCE OF CARBON DIOXIDE ON THE CATALYTIC OXIDATIVE COUPLING OF METHANE OVER A-La2O3 AND 2-La2O2CO3 Ph.D. Thesis
R. P. Taylor Sep. 1992 170 p
(Contract W-7405-eng-82)
(DE93-004800; IS-T-1615) Avail: CASI HC A08/MF A02

Previous work correlated oxycarbonate and ability of La oxide-based materials to promote the oxidative coupling of methane (OCM). Since A-La2O3 and 2-La2O2CO3 may be prepared from each other by loss and gain of CO2 at 415 to 970 C, influence of CO2 on OCM process is of great interest. This work found that co-feeding CO2 over pure A-La2O3 and 2-La2O3CO3 starting materials depresses catalytic performance by both decreasing the catalyst ability to activate methane and inhibiting the homogeneous reaction pathway of ethane dehydrogenation. Superior catalytic performance was found to depend on presence of both A-La2O3 and 2-La2O2CO3. Both A-La2O3 and 2-La2O2CO3 starting materials were found to uptake CO2 between (LaO)(2)(sup 2+) layers. CO2 uptake by 2-LaO2CO3 was greater due to open structure along c axis. Isotopic labeling revealed that the CO2 used in preparing 2-La2O2CO3 from A-La2O3 inserts directly into oxide layers of A-La2O3 to give layers of (CO3(sub 2-)) anions. CO2 evolved during thermal decomposition of 2-La2O2CO3 originates from the same (CO3)(sub 2-) layers of the oxycarbonate. During OCM, C atoms originating in 2-La2O2CO3 were detected in products CO and CO2, but not in the coupling products. Therefore, ethane and ethylene are produced only via methane coupling. The O atoms originating in the (CO3)(sup 2-) layers of the catalyst were also detected in products CO and CO2 during OCM. CO2 was produced on the catalyst rather than in the gas phase. Oxygen present in 2-La2O2CO3 was capable of activating methane. Amounts of coupling products following a He/CH4 pulse were equivalent to 2 percent of those for a He/CH4/O2 feed pulse. DOE

FLUID DENSITY AND CONCENTRATION MEASUREMENT USING NONINVASIVE IN SITU ULTRASONIC RESONANCE INTERFEROMETRY
N. G. Pope, D. K. Veirs, T. N. Claytor, and M. B. Histand (Colorado State Univ., Fort Collins.) 1992 5 p Presented at the IEEE Symposium on Ultrasonics, Tucson, AZ, 20-23 Oct. 1992
(Contract W-7405-eng-36)
(DE93-003741; LA-UR-92-3309; CONF-9210241-1) Avail: CASI HC A01/MF A01

A method of noninvasively measuring the density of fluids contained within pipes, cans, tanks, and bottles was developed. The container-fluid system is interrogated using an ultrasonic transducer. A second transducer is used to observe transmitted energy as the input frequency is swept through an appropriate range determined by the geometry. Resonance peaks are observed in the transmitted energy. The periodicity of the resonant peaks is determined by analyzing the response data using a fast Fourier transform. The technique was tested using known NaCl concentration standards within a stainless steel pipe. The concentration of unknown NaCl solutions were then measured in situ with an accuracy of plus or minus 0.15 M over a range of 0.4 to 3.4 M corresponding to an accuracy of plus or minus 0.02 specific gravity (SG) units over a range of 1.000 to 1.134 SG units. The precision of each measurement ranged from 1 part in 10,000 to 1 part in 1000. Changes in temperature shift the period in a manner similar to shifts from concentration changes; for NaCl solutions the temperature effect can be expressed as an equivalent concentration change and was found to be 0.029 M per C or 0.59 percent over the concentration range measured. Data collection time for a single measurement was less than 2 seconds. DOE

LIFE CYCLE TESTING OF DESICCANT CORE SAMPLES Final Report, Oct. 1990 - Dec. 1991
B. M. Cohen, S. Neoh, and M. Ross Oct. 1992 95 p Sponsored by Gas Research Institute, Chicago, IL
(Contract GRI-5090-246-2070)
(PB93-127058; GRI-92/0455) Avail: CASI HC A05/MF A01

Several types of desiccant wheels are being used by domestic manufacturers of desiccant dehumidification and cooling equipment. Also, new desiccant cores are under development at GRI. There has been no data base regarding the long-term durability of such wheels. Tecogen had previously measured the performance of new core materials and reported on that work in an earlier report. The work involved subjecting the wheel core samples to extended thermal and moisture cycling in order to determine their ability to retain their characteristics over extended periods of operation. The core samples fell into three categories: lithium chloride, silica gel, and molecular sieve. The molecular sieve cores showed the least degradation, but the regeneration temperature was really too low for the desiccant and that may have contributed to their durability. Lithium chloride cores experienced degradation in total water absorbed, to different degrees, but retained performance, possibly because they characteristically begin with very high levels of moisture uptake. Silica gel wheels degraded significantly

in water uptake and also in performance, probably because they have less excess capacity than lithium chloride cores. Where degradation was high, in practice, an increase in wheel rotational speed can partially offset the performance degradation. GRA

THE COMBUSTION OF DROPLETS WITHIN GAS TURBINE COMBUSTORS: SOME RECENT OBSERVATIONS ON COMBUSTION EFFICIENCY
J. Odgers, D. Kretschmer, and G. F. Pearce (Aeronautical Research Labs., Melbourne, Australia.) Feb. 1991 68 p
(PERD-JO-194; CTN-93-60698) Avail: CASI HC A04/MF A01

Gas turbine combustors usually employ liquid fuels injected as a spray of small droplets, which are then considered to vaporize and to burn as a vapor/air diffusion flame. The effects of droplet size on combustion efficiency in such combustors were examined through a review of the literature and experiments in scaled combustors. An examination of fuel evaporation/combustion rate equations, residence times available in combustors, and turbulent flame phenomena seems to indicate that either diffusion processes or droplet evaporation would limit the combustion. The times for the latter two processes seem to be too long to be in accord with the available times within practical combustion systems. In experimental studies on two combustors of widely different geometries and fuel systems, a series of correlations was developed to describe their combustion efficiency performance. A significant loss in correlation accuracy is noted when droplet size is included. The experimental results also showed that under steady state conditions, when droplet size was varied by changing the fuel atomizer, there was no noticeable effect on combustion efficiency attributable to the variation in droplet size. It is recognized that droplet size may be of importance in unsteady conditions and in other possible conditions not investigated in the experiments. CISTI

TRANSIENT RADIATION PROPERTIES OF STRONGLY RADIATING TURBULENT FLAMES Ph.D. Thesis
Jer-Huan Jang 1992 188 p
Avail: Univ. Microfilms Order No. DA9234583

A theoretical and experimental study of transient radiation properties of strongly radiating turbulent diffusion flames is described with emphasis on understanding the temporal variations in radiative heat loss fractions. The theoretical analysis includes the numerical integration of enthalpy equation in time to calculate transient properties of strongly radiating flames and time series to simulate radiation interaction with turbulence. A new approach, Eulerian-Lagrangian method, has been used to find the transient properties of strongly radiating turbulent flames. Simultaneous transient measurements of temperature, soot volume fraction (emission and absorption), and carbon dioxide concentration have been obtained using a five wavelength intrusive absorption/emission probe. The five line optical diagnostic technique was used for the first time to measure transient soot volume fractions, temperature and carbon dioxide concentrations simultaneously in strongly radiating turbulent flames. The results of this research give us an improved understanding of the radiation heat loss mechanism in strongly radiating turbulent flames. Existing intrusive optical probes has been developed further to yield five channels of information. Data concerning local instantaneous radiative heat loss fraction have been obtained and not only serve to evaluate the results of the analysis but also aid in the development and evaluation of more rigorous treatments. The contributions of this research are (1) unique structure has been discovered for strongly radiating flames; (2) significant advancement of intrusive optical diagnostics technology has been applied; and (3) large amount of cold soot has been observed. Dissert. Abstr.

ACOUSTIC DETERMINATION OF DEWPOINTS IN NATURAL GAS MIXTURES AND RETROGRADE CONDENSATES Annual Report, Jan. - Dec. 1989
S. O. Colgate Feb. 1992 181 p Sponsored by Gas Research Inst., Chicago, IL
(PB93-142917; GRI-92/0355) Avail: CASI HC A09/MF A02

The sonic speed is utilized as a sensitive probe for detecting phase boundaries and critical points of fluids. Location of the boundary is revealed by a discontinuity in the variation of sonic speed with temperature for a sample confined isochorically in a spherical acoustic resonator. The corresponding temperature at which this discontinuity occurs was taken as a phase boundary temperature. This indicator is very pronounced, especially when the system is near the critical condition for which strong local density fluctuations disperse sound and cause the sonic speed to dip sharply toward zero. This research reports on such studies for two pure gases CO2, and C2H6 and one mixture of these two. For each system, data on resonance frequency, amplitude, and pressure as a function of temperature were collected under computer control for a series of different loading densities around the critical value. Portions of the phase diagrams revealed by the measurements were recorded in tabular and graphical formats. GRA

STUDIES OF THE FORMATION CHEMICAL REACTIVITY AND PROPERTIES OF SMALL CLUSTERS APPLICATION TO AN UNDERSTANDING OF AEROSOL FORMATION AND HETEROGENEOUS CHEMISTRY
A. W. Castleman, Jr. 1992 18 p
(Contract DE-FG02-88ER-60648)
(DE93-005920; DOE/ER-60648/5) Avail: CASI HC A03/MF A01

Chemical reactions that proceed following either a photophysical or ionizing event, are directly influenced by the mechanisms of energy transfer and dissipation away from the primary site of absorption. Neighboring solvent or solute molecules can affect this by collisional deactivation (removal of energy), through effects in which dissociating molecules are kept in relatively close proximity for comparatively long periods of time due to the presence of the solvent, and in other ways where the solvent influences the energetics of the reaction coordinate. Research on clusters offers one of the most viable ways of elucidating the molecular details of these processes. The current program is comprised of three general areas of research. Investigation of the dynamics of ionization and the mechanisms of the early-time reactions following the interaction of ionizing electromagnetic radiation with matter; measurement of the kinetics of ensuing ion reactions with effort focused on the influence of solvation effects and identifying similarities and differences between gas and condensed phase reactions; and determination of the structure of solvated reaction centers via spectroscopy, dynamics and thermochemistry. (DE93-006892; DOE/ER-13857/T3) Avail: CASI HC A01/MF A01

This program involves two complementary activities: (1) development and application of cw ring dye laser absorption methods for sensitive detection of radical species and measurement of fundamental spectroscopic parameters at high temperatures; and (2) shock tube studies of radical-molecule and radical-radical reactions relevant to combustion. Species currently under investigation in the spectroscopic portion of the research include NO and CH3; this has necessitated the development of a unique intracavity frequency-doubling system for our cw laser which operates at wavelengths in the range 210-230 nm. Shock tube studies of reaction kinetics currently are focussed on reactions of CH3 radicals. DOE

THEORETICAL STUDY OF REACTIONS AT THE ELECTRODE-ELECTROLYTE INTERFACE
J. W. Halley 1993 6 p
(Contract DE-FG02-91ER-45455)
(DE93-006899; DOE/ER-45455/1) Avail: CASI HC A02/MF A01

Electron transfer rates are predicted by numerical methods in a collaboration with Argonne National Laboratory. Emphasis is on electron transfer involving ions known to be important in enhancing stress corrosion cracking in light water reactors and on electron transfer at oxide surfaces. We have produced a new theory for description of the Jahn Teller effect in the solvation shell of the cuprous ion in aqueous solution, have implemented it in a molecular dynamics simulation, and compared the results with experimental neutron scattering measurements on solutions containing the cuprous ion. A large amount of numerical data was collected

on the transition state of the ferrous ferric electron transfer reaction at an electrode. Work was completed on a polarizable and dissociable model of water for use in the electron transfer studies. New calculations of the conductivity in models of oxides have shown the existence of impurity conduction bands in such models for the first time. DOE

INVESTIGATION OF CRITICAL C/H/N/O REACTIONS IN NOx FORMATION AND REMOVAL IN NATURAL GAS COMBUSTION Final Report, Jul. 1986 - Aug. 1992
R. K. Hanson and C. T. Bowman Aug. 1992 28 p Sponsored by Gas Research Inst., Chicago, IL
(Contract GRI-5086-260-1248)
(PB93-132702; GRI-92/0429) Avail: CASI HC A03/MF A01

The kinetics of reactions important in the formation and removal of NO in the combustion of natural gas were investigated using a shock tube. Detection of key reactant and product species was accomplished by various optical techniques, including atomic resonance absorption for measurement of atomic species and narrowline laser absorption for detection of molecular species. In some experiments, both thermal pyrolysis and laser photolysis techniques were used to initiate reaction, thereby extending the temperature range for which data could be obtained. Development of a comprehensive reaction mechanism for natural gas combustion and NO formation has been initiated in collaboration with other Gas Research Institute (GRI) researchers. Kinetic data from the present shock tube study have been included in the mechanism. GRA

During the course of this work, we focused on the extension of the vortex method and the transport element method to three-dimensional flows and to reacting flow with finite heat release, density variation and volumetric expansion. Problems explored in detail include the formation of streamwise vorticity in uniform-density and variable density flow, the effect of this vorticity on the rate of product formation and the effect of volumetric expansion due to heat release on shear layer growth rate. COMPARISON OF DIFFERENT SYNTHETIC ROUTES FOR SULFONATION OF POLYANILINE Technical Report, 31 May 1991 - 30 Jun. 1992
J. Yue, G. Gordon, and A. J. Epstein 29 Jun. 1992 33 p
(Contract N00014-90-J-1559)
(AD-A259662; Rept-1992-48) Avail: CASI HC A03/MF A01

Polyanilines containing sulfonic groups covalently bonded to the back were synthesized from parent polyaniline via sulfonation of the polymer utilizing differing sulfonation agents and differing means. The sulfonation conditions were studied as a function of several parameters including sulfonation time, starting forms of the precursor polymer, presence of oxidizer, ((NH4)2S2O8), and temperature. The sulfonated polyanilines were characterized by FTIR, elemental analyses, DC conductivity, and electrochemical methods. It was found that using fuming sulfuric acid as the sulfonation agent gave both higher conductivity and higher sulfonation level for sulfonated polyaniline than implementation of other sulfonation agents and means. ELECTRONIC CONTROL OF pH AT SULFONATED POLYANILINE ELECTRODES Technical Report, 31 May 1991 - 30 Jun. 1992
J. Yue and A. J. Epstein 1 Jul. 1992 12 p
(Contract N00014-90-J-1559)
(AD-A260074; TR-1992-49) Avail: CASI HC A03/MF A01

The pH of aqueous solutions in the vicinity of a thin self-doped conducting polyaniline electrode was electrochemically modulated using both cyclic voltammetry and step potential techniques. Changes in pH were measured directly by using a microcombination pH probe. The experimental results demonstrate that the polymer behaves as a proton ejector during oxidation and a proton absorber during reduction. This potential-controlled pH change near the polymer coated electrode may be applied to many fields benefitting from electronic control of the proton environment near an electrode surface, for example, control of enzyme activity. METHANE CONVERSION BY SOLID ELECTROLYTE MEMBRANES Annual Report, 1 Jan. 1990 - 31 Aug. 1992
Anthony F. Sammells, Michael Schwartz, Ronald L. Cook, and James H. White Sep. 1992 89 p Sponsored by Gas Research Inst., Chicago, IL
(Contract GRI-5089-260-1824)
(PB93-127041; GRI-92/0441) Avail: CASI HC A05/MF A01

The program is focussing on solid-state fuel cells which operate in the same temperature range as molten carbonate fuel cells. One approach involves selecting new solid electrolytes with high ionic conductivity at around 600 C. Experimentally determined activation energies for ionic transport in perovskite solid electrolytes were found related to lattice and thermodynamic parameters. Using the approach, solid electrolytes having high ionic and low electronic conductivity were identified. These electrolytes were incorporated in small unoptimized laboratory fuel cells that may perform better at 600 C than zirconia based SOFC's at 1000 C, assuming that many other issues can be resolved. These issues include the chemical and physical stability of cell components, including electrocatalysts for each respective half-cell reaction and the development of multicell designs and fabrication procedures. Progress was made in identifying anode electrocatalysis towards promoting partial and complete CH4 oxidation. New fuel cell structures are being defined using thin-film techniques involving metalloorganic chemical vapor deposition (MOCVD) of solid electrolytes. Author (revised)

THE DESIGN AND CONSTRUCTION OF AN ION TRAP BASED SYSTEM FOR LASER PYROLYSIS/MASS SPECTROMETRY OF SINGLE ORGANIC AEROSOL PARTICLES Technical Report, 1 Aug. 1991 - 31 Jul. 1992
Henk L. Meuzelaar, Paul A. Cole, Neil S. Arnold, and George Hars Oct. 1992 15 p
(Contract DAAL03-91-G-0296)
(AD-A260455; ARO-29332.1-LS) Avail: CASI HC A03/MF A01

The development of particle introduction techniques to support a three year program for analysis of single bacteria via laser pyrolysis/mass spectrometry is described. Results of an investigation into various sample introduction techniques are discussed including the highly successful quasi-electrospray introduction method using a suspension of particles in methanol. Particles from 0.9 to 13 microns were levitated at pressures down to 10(exp -7) torr, and mass spectrometry pressures of 10(exp -3) torr were obtained in less than 10 min from particle. The effectiveness of these techniques for particle introduction, pump down, and stabilization exceeded the authors expectations and gives a positive prognosis for efforts to perform initial laser pyrolysis/mass spectrometry experiments in the year two effort. EXPERIMENTAL AND THEORETICAL STUDIES OF REVERSE MICELLES IN DENSE GASES Final Report, Oct. 1989 - Oct. 1992
Bernard A. Kraus and Athanassios Panagiotopoulos 10 Nov. 1992 36 p Presented at the AIChE Convention, Los Angeles, CA, Nov. 1991, and Miami Beach, FL, Nov. 1992 Sponsored by Gas Research Inst., Chicago, IL
(Contract GRI-5089-260-1873)
(PB93-141901; GRI-92/0446) Avail: CASI HC A03/MF A01

Dense gas micellar systems possess a number of unique properties which make them potentially attractive for use in separation processes. This project aims at determining if such applications are viable by examining the relationship between aggregate or micelle size and pressure and the addition of salt. Our work has shown that both pressure and the addition of salt drastically affect the formation of surfactant aggregates in light hydrocarbon-water mixtures. Increases in pressure produce corresponding increases in the hydrocarbon density which dramatically improves the solubility of surfactant in the hydrocarbon phase and causes the formation of more surfactant aggregates. The addition of salt changes the behavior

in two ways. The presence of salt lowers the pressure required to begin the formation of aggregates. Also as salt concentration is increased, the aggregates shrink in size. We have also observed that mixtures of light hydrocarbons are more effective solvents for surfactant than any individual light hydrocarbons. GRA

HIGH PERFORMANCE NANOCOMPOSITE DESICCATION MATERIALS Topical Report, Mar. 1990 - Jun. 1992
Sridhar Komarneni, Prakash B. Malla, and Rustum Roy Jul. 1992 93 p
Sponsored by Gas Research Institute, Chicago, IL
(Contract GRI-5087-260-1473)
(PB93-127025; GRI-92/0438) Avail: CASI HC A05/MF A01

The objective of the research was to tailer-make high performance nanocomposite desiccant materials consisting of clays, gels, and zeolites for gas-fired dehumidification and cooling system applications. Synthetic zeolite Na-Y was modified and its water sorption properties were studied. The modified products exhibited ideal isotherm shape (separation factor between 0.07 and 0.1) and are highly crystalline with high thermal and hydrothermal stability, long regenerative life, and high sorption capacity (less than 30 percent by weight). Many aluminosilicate zeolites having different silicon to aluminum ratio and structures were synthesized with or without templates. Some of these materials exhibited ideal isotherm shapes with about 16-33 percent (by weight) sorption capacity. Aluminophosphate (AlPO4) and silicoalumino-phosphate (SAPO) molecular sieves of varying pore sizes were synthesized and their stability and water sorption properties were studied. One of the SAPO's exhibited close to ideal water sorption isotherm with 40 percent (by weight) sorption capacity although many of these materials exhibited nonideal isotherm shapes due to nonpolar or only slightly polar nature of their pore surfaces. A chemical method involving methanoic HCl was used to remove occluded organic molecules from AlPO4 and SAPO molecular sieves. The method was found to be effective so long as there is no steric hindrance for the methanolic HCl to enter and/or the template molecules to diffuse out of the molecular sieve channels and cages. The method of removal of organic molecules was also found to be effective in stablizing SAPO-37 against water vapor. Author

EXPERIMENTAL AND NUMERICAL INVESTIGATION OF HYDROGEN COMBUSTION IN A SUPERSONIC FLOW Ph.D. Thesis
Corin Segal 1991 174 p
Avail: Univ. Microfilms Order No. DA9237650

Supersonic combustion ramjet, or SCRAMJET, engines are currently being evaluated for the propulsion of hypersonic vehicles. A unique supersonic wind tunnel facility has been built at the Aerospace Research Laboratory to simulate the operation of a SCRAMJET over a range of Mach numbers of 5 to 6.5 and altitudes of 40,000 to 150,000 ft. The tunnel provides high stagnation temperature, clean air in a continuous Mach 2 flow to the combustor where hydrogen is injected and burned. One of the major parameters in the design of the engine is the combustion efficiency, a quantity which is extremely difficult to evaluate directly. Wall pressure and temperature measurements were made on a model combustor in the ARL facility and a one-dimensional, chemical equilibrium, finite difference model was used to infer combustion efficiency. The initial stagnation temperature was maintained around or below 850 K and an inlet static pressure of 1/2 atm, or less. At these relative low temperatures, thermal choking occurred for relatively low equivalence ratios, limiting this parameter to a maximum of 0.1, depending on the injection configuration. A detailed validation of the analytical model requires extensive knowledge of the physical properties of the flowfield. Since reliable, non-intrusive measurements methods are still under development, the results of the combustion efficiency evaluation were compared with a detailed numerical simulation of the flowfield of interest. The numerical simulation used a 3-D full Navier-Stokes program, which includes a finite rate chemistry model to duplicate one of the experimental cases. The calculations were performed on a CRAY - 2S supercomputer at the National Supercomputer Applications Center at NASA Langley. The solution required 35 CPU hours. The comparison between the 3-D computation and the 1-D calculation indicated a good agreement of the flowfield fluid dynamic properties, but predicted large differences in combustion efficiency. Dissert. Abstr.

EFFECT OF TRIPLET CORRELATIONS ON THE ADSORPTION OF A DENSE FLUID ONTO A CRYSTALLINE SURFACE
Dale A. Huckaby and L. Blum 15 Jan. 1993 15 p
(Contract N00014-90-J-1263)
(AD-A260306; TR-16) Avail: CASI HC A03/MF A01

The adsorption of a fluid of hard spheres of diameter a onto a planar surface containing a triangular lattice of adsorption sites, spacing sigma, was studied using a model which is equivalent to a lattice gas with n-body interactions that are related to the n-body correlation functions of the fluid. The present paper extends our previous work, which included only pairwise interactions, to also include triplet interactions. We discovered a simple but accurate analytical approximation to the triplet correlation function for three spheres in mutual contact, which, when combined with a Mueller-Hartmann and Zittarz approximation of the critical point in the equivalent lattice gas, yields the estimate P(sub c)(sigma(exp 3)) = 0 .8409 of the fluid density at the critical point of the condensation transition which occurs at the fluid-crystal interface. This estimate, which includes the effects of both pair and triplet correlations in the fluid, is significantly higher than the value p(sub c)(sigma(exp 3)) = 0.6678 obtained if only the effects of pair correlation are included in the calculation. GRA

CORRELATIONS BETWEEN THE LIGAND ELECTROCHEMICAL PARAMETER, E(SUB L)(L) AND THE HAMMETT SUBSTITUENT PARAMETER SIGMA Technical Report No. 51, Jun. 1991 - Jul. 1992
Hitoshi Masui and A. B. Lever 25 Jan. 1993 22 p
(Contract N00014-91-J-1910)
(AD-A260299) Avail: CASI HC A03/MF A01

Correlations of the electrochemical parameter, E(sub L)(L) with Hammett and Taft parameters, sigma(sub p), sigma(sub m), sigma(sup +), and sigma(sup °) are presented and discussed. The correlations provide a means to extend the electrochemical parameter and the Hammett and Taft databases. Recently, a ligand electrochemical parameter, E(sub L)(L), based upon the Ruthenium(3)/2 reduction potential as an electrochemical standard, was introduced and developed. This parameter allows one to predict the metal-centered redox potential of a variety of complexes based on the additivity of the E(sub L)(L) parameters. GRA

LASER SPECTROSCOPY OF STIMULATED SCATTERING IN COLLISIONALLY BROADENED GROUP 2A METAL VAPORS Final Report, 1 Oct. 1988 - 1 Apr. 1992
Jim Kelly Nov. 1992 54 p

(Contract F29601-88-C-0024)
(AD-A260532; AD-E201367; PL-TR-92-1040) Avail: CASI HC A04/MF A01

This study is concerned with the development of efficient nonlinear materials which can generate 3-5 microns infrared (IR). Work involved the use of Ca and Sr metal vapors as electronic Raman scattering (SRS). This involved the development of narrow bandwidth pulse lasers, scattering cells, high speed IR detectors, and suitable experimental diagnostics to study the gain for SRS and its temporal development. It was found that SRS never generated, but instead, a variety of other nonlinear responses were readily induced, the most notable being superfluorescence (SF). Results of these studies of SF in the optically trapped principal resonance state of Ca(Sr) may be useful in the development or diagnostics of plasma based x-ray lasers. GRA

VOLTAMMETRIC CHARACTERIZATION OF SOLUBLE POLYACETYLENE DERIVATIVES OBTAINED FROM THE RING-OPENING METATHESIS POLYMERIZATION (ROMP) OF SUBSTITUTED CYCLOOCTATETRAENES Technical Report, 1 Jan. - 31 Dec. 1992
Thomas H. Jozefiak, Eric J. Ginsburg, Christopher B. Gorman, Robert H. Grubbs, and Nathan S. Lewis 15 Jan. 1993 46 p
(Contract N00014-91-J-1303)
(AD-A260071; TR-2) Avail: CASI HC A03/MF A01

High molecular weight, amorphous, partially substituted polyacetylenes (poly-RCOT) have been prepared using the ring-opening metathesis polymerization of substituted cyclooctetraenes. Spin-cast films of these polymers yielded unusually sharp, well-defined reversible electrochemistry for oxidative and reductive doping processes. As the substituent on the polymer chain was varied (R = alkyl, tert-butoxy, trimethylsilyl, and p-X-phenyl), the potentials for oxidative and reductive doping changed by 0.3 V. In addition, the separation between the oxidative and reductive doping processes varied from 1.66 V to greater than 2.0 V. Coulometry suggested that the reversible doping step represented a transfer of 1 electron for every 13-15 double bonds of the polymer. In contrast, the electrochemistry of predominantly- cis poly-RCOT films was irreversible, and indicated the presence of an electrochemical cis-trans isomerization on the first voltammetric sweep through either reductive or oxidative doping. Spectroelectrochemical studies indicated that the electrochemically doped poly-RCOT materials R=sec-butyl, (CH3)3Si) possessed mid-gap transitions at energies of 0.8-0.9 eV. The redox chemistry of the soluble, poly-RCOT (R=sec-butyl, (CH3)3Si) species in CH2Cl2 solution was also investigated. Voltammetric studies showed that both the reductive and oxidative doping processes were chemically irreversible, and indicated that the dissolved polymers were electroactive over a wide range of potentials. A long-term goal of the Air Force is to develop near-stoichiometric gas turbine combustors that will burn broad-specification fuels, and have low maintenance and high durability. Towards meeting this goal, this program had two principal objectives: to design and conduct experiments that will establish a fundamental understanding of lean blowout (LBO), swirling flames, kinetically controlled combustion, and turbine blade cooling, and to provide data sets for evaluating and refining computer models of gas turbine combustor. We successfully designed and operated several laboratory combustors. Two novel methods for CARS slit function were developed; these made possible precise and unambiguous measurements of flame temperature. We identified the complex sequence of events leading to LBO and obtained and analyzed LBO data for different combustor loadings. We investigated the effects of geometric, chemical, and turbulent flow parameters on the structure of the recirculation zone and the flame inside the combustor. Our heat transfer experiments showed that freestream turbulence augments flat plate heat transfer 2 to 2.5 times. Finally, benchmark-quality data for evaluating and refining computer models of gas turbine combustor were made available to industry. In this manner, the program objectives were met.... Lean blowout, Flame stabilization, Combustor design, Swirling flames, Turbulent combustion, Turbine blade cooling. GRA

During the tenure of the project, we have studied the ion-molecule reactions involving collisions of low energy CHO(+) ions and CH4, H2, N2, O2, etc. molecules. Several electronically excited states have been identified and the reaction rate coefficients have been measured for the strongest band(s) of the excited state molecules or radicals and the atomic lines. We have also extensively studied the Stimulated Raman scattering processes in a wide and capillary tubings and have measured the efficiency of scattered laser lines at various wavelengths in CH4 and H2 as gain media. These experiments were performed at high pressures of these gases (100 - 500 psi) and high pump energy (1-100 mJ) of the third harmonic of the Nd:YAG laser. Our results indicate that the capillary tubing is slightly more efficient that the wide bore tubing and a compact Raman laser source may be built for scientific research. In addition, we have studied the competition between the stimulated Raman and Brillouin scattering processes and calculated the corresponding gain coefficients. During the studies of the scattering processes, we have observed the two photon excitation and dissociation of CH4 and H2 molecules using the third harmonic pulsed laser line at 355 run from Nd:YAG. The photodissociative excitation of CH-radicals and H-atomic lines may be used for diagnostic purposes of the unburnt methane and hydrogen gases in combustion flame. GRA

This technical report summarizes research on decomposition of NO(x) by photopromoted and thermal solid-catalyzed decomposition of NO. Typical catalysts incorporated one or more metal oxides. Photopromotion of catalytic activity was observed with several catalysts. Nearly complete thermal decomposition of NO was achieved by several catalysts in the absence of O2. However, no combination of catalyst and conditions achieved satisfactory rates of decomposition of NO in the presence of target concentrations (greater than 10 percent) of O2. GRA

Time-dependent, multidimensional computations were performed to study basic issues related to the structure of shocks, detonations, and modes of combustion affecting the feasibility or performance of the ram accelerator. A focus was on understanding of the structure and stability of oblique detonations generated by oblique shocks in supersonic fuel-air mixtures. The simulations show that steady, oblique detonations can be stabilized in supersonic flows and that they have very complex, multidimensional structures. Basic elements of such detonation structure include the following: (1) a nonreactive, oblique shock, (2) an induction zone, (3) a set of deflagration waves, and (4) a reactive shock in which the shock front is closely coupled with the energy release. This structure is stable and resilient to disturbances in the flow in a wide range of flow and mixture conditions. The conditions under which the overall detonation structure becomes unstable were also identified. Preliminary studies which compared extremely resolved Navier-Stokes simulations to a boundary-layer model indicate some fundamental disagreements between the model and the simulations which require further investigations to resolve. The development of an advanced dynamic model for aeroelastic hypersonic vehicles powered by air breathing engines requires an adequate engine model. This report provides a discussion of some of the more important features of supersonic combustion and their relevance to the analysis and design of supersonic ramjet engines. Of particular interest are those aspects of combustion that impact the control of the process. Furthermore, the report summarizes efforts to enhance the aeropropulsive/aeroelastic dynamic model developed at the Aerospace Research Center of Arizona State University by focusing on combustion and improved modeling of this flow. The expanded supersonic combustor model described here has the capability to model the effects of friction, area change, and mass addition, in addition to the heat addition process. A comparison is made of the results from four cases: (1) heat addition only; (2) heat addition plus friction; (3) heat addition, friction, and area reduction, and (4) heat addition, friction, area reduction, and mass addition. The relative impact of these effects on the Mach number, static temperature, and static pressure distributions within the combustor are then shown. Finally, the effects of frozen versus equilibrium flow conditions within the exhaust plume is discussed. Author (revised)

Alcoa's commercial membrane with 40 A pore diameter has been identified as one of the potential candidates for high temperature gas separations. This asymmetric multiple layer membrane has been well characterized and evaluated. It has excellent thermal stability and acceptably hydrothermal stability at approximately 650 C or above. Gas separations with this membrane follow Knudsen diffusion. Its selectivity is suitable for bulk separations, or for reduction/elimination of H2S and NH3 via selective removal of hydrogen. An improved separation efficiency with this membrane is highly desirable for applications involving hydrogen separation, and the removal of trace contaminants, such as H2S and NH3. One of the effective avenues in improving the efficiency of the existing membrane is to narrow its pore size through surface modifications. Thus membranes with a smaller pore size can be readily available through minor modifications of the existing commercial product. In this paper focus is on the morphological characterization and performance evaluation of hydrogen-selective and zeolitic membranes developed from existing commercial membranes. DOE

Results of the pyridine adsorption studies on native and K-doped alumina provide fundamental grounding for the observed methanol dehydration activity of these samples. Both the reactor studies and the pyridine adsorption studies support the conclusion that the K-doped sample had reduced Lewis acidity. Moreover, we were able to measurably alter the acidity of the support surface by our ion exchange treatment. More significantly, when reactor results for transition-metal loaded samples are reconsidered in combination with their surface characteristics suggested by our pyridine adsorption studies, our hypothesis that Rh and Mo have ultimately titrated the support surface seems all the more convincing. Hence, in light of the pyridine adsorption results, the attenuation of a transition-metal based decomposition pathway for methanol on the metal-loaded samples-as seen in the reactor testing-is all the more reasonable. A study aimed at the characterization of catalyzer phases by Raman spectrometry is presented. Structural data and available spectroscopy for different VPO (Vanadium Phosphorous Oxygen) phases identified in the catalyzers are given. Experimental methods developed, in particular Raman spectrometry coupled with chromatographic analysis, for in situ catalytic reaction analysis are presented. Results, relating to temperature, on the Raman spectra of pure phases, the modifications introduced by hydration, and the phase behavior in reactional medium in catalysis conditions are reported. Structural considerations based on the literature and observations are given. An attempt to give a synthetic image of VOPO4 phases is made. The behavior of the precursor and its activation and transformation as catalyzer are described. ESA

Ellipsometric analyses were performed on a number of amorphous SiC films grown on Si which are currently being considered for x ray lithography (XRL) mask membranes. The analyses and conclusions presented increase the accuracy with which the layer thicknesses can be determined. In addition, materials-related information such as the presence of surface roughness, Si and graphite phases, as well as densification can be discerned from the data. The sensitivity of ellipsometry to very small changes in the phase of light (equal to or less than 0.002 deg) makes it an extremely accurate optical tool capable of detecting small changes in thickness or optical properties. Samples were measured by single-frequency and spectroscopic ellipsometry. The measurements were analyzed by using a number of models. Three models with increasing degree of complexity and sophistication for the amorphous SiC film are compared: an isotropic one-layer model, an isotropic two-layer model that accommodates a surface layer/region, and a uniaxial one-layer model to account for possible built-in strain in the film. The two layer model was found to give the most consistent fit to the experimental data. GRA

MEASUREMENT OF THE CRITICAL LEVEL OF MOISTURE FOR INITIATION OF WATER-VAPOR-INDUCED ENVIRONMENTAL EMBRITTLEMENT IN A Fe3AL-BASED ALLOY
C. G. McKamey and E. H. Lee 1992 6 p Presented at the Material Research Society Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-004104; CONF-921101-10) Avail: CASI HC A02/MF A01

Iron aluminides based on Fe3Al are of interest as structural materials because of their excellent corrosion resistance. However, studies have shown that one of the major causes of low room temperature tensile ductility, which so far has limited the use of these alloys, is an environmental reaction involving aluminum in the presence of water vapor. During this reaction, atomic hydrogen is released, moves into the sample ahead of the crack tip during stressing, and causes failure before the true ultimate tensile strength of the material is reached. This reaction is reduced significantly by testing in oxygen or vacuum. In the present study, an Fe3Al-based alloy was tensile tested as a function of the level of water vapor in the test environment, from a vacuum of 10(exp -4) Pa to a water vapor partial pressure of 1330 Pa. The results show that a water vapor level of as low as 133 Pa (1 torr) can result in significant embrittlement. The fracture mode remains transgranular cleavage, but the scale of the cleavage facets changes with the water vapor level. DOE

PRETRANSFORMATION STRAIN MODULATIONS IN PROPER FERROELASTICS
A. Saxena and G. R. Barsch (Pennsylvania State Univ., University Park.) 1992 19 p Presented at the Center for Nonlinear Studies (CNLS) Conference: Nonlinearity in Materials Science, Los Alamos, NM, May 1992
(Contract W-7405-eng-36)
(DE93-005468; LA-UR-92-4327; CONF-9205229-3) Avail: CASI HC A03/MF A01

Within the framework of the Landau-Ginzburg model for the O(sub h)-D(sub 4h) proper ferroelastic transformation pretransformation structural modulations may arise as (possibly defect-stabilized) pseudo-critical fluctuations that can be described by an effective elastic phi(sub 4) model. Here we show that the strain amplitude and temperature dependence of an intermediate tetragonal phase observed above and concurrently with the face-centered cubic to face-centered tetragonal transition in Fe(0.7)Pd(0.3) can be understood semi-quantitatively in terms of the crossover behavior from the Ising to the displacive limit by applying the crossover phase diagram of Beale, Sarker and Krumhanal to the effective phi(sup 4) model. The fact that this type of pretransformation modulation has not been observed with x-ray for other ferroelastic transformations can be attributed to large values of the order parameter gradient coefficient in these cases. DOE

GENERALIZED MELTING CRITERION FOR AMORPHIZATION
R. Devanathan (Northwestern Univ., Evanston, IL.), N. Q. Lam, P. R. Okamoto, and M. Meshii (Northwestern Univ., Evanston, IL.) Dec. 1992 7 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract W-31-109-eng-38)
(DE93-005557; ANL/MSD/CP-76615; CONF-921101-59) Avail: CASI HC A02/MF A01

We present a thermodynamic model of solid-state amorphization based on a generalization of the well-known Lindemann criterion. The original Lindemann criterion proposes that melting occurs when the root-mean-square amplitude of thermal displacement exceeds a critical value. This criterion can be generalized to include solid-state amorphization by taking into account the static displacements. In an effort to verify the generalized melting

criterion, we have performed molecular dynamics simulations of radiation-induced amorphization in NiZr, NiZr2, NiTi, and FeTi using embedded-atom potentials. The average shear elastic constant G was calculated as a function of the total mean-square atomic displacement following random atom-exchanges and introduction of Frenkel pairs. Results provide strong support for the generalized melting criterion. DOE

ABLATION, MELTING, AND SMOOTHING OF POLYCRYSTALLINE ALUMINA BY PULSED EXCIMER LASER RADIATION
D. H. Lowndes, D. B. Geohegan, M. DeSilva (Tennessee Univ., Knoxville.), M. J. Godbole (Tennessee Univ., Knoxville.), and A. J. Pedraza (Tennessee Univ., Knoxville.) Nov. 1992 7 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-005148; CONF-921101-26) Avail: CASI HC A02/MF A01

Effects of pulsed XeCl (308 nm) laser radiation on polycrystalline Al2O3 (alumina, 99.6 percent pure) and single-crystal Al2O3 (sapphire) are studied as a function of laser fluence. No laser etching of either material is detected below a threshold fluence value (much lower for alumina than for sapphire). Above this threshold, laser etching of both materials is observed following a number of incubation (induction) pulses. This number is much larger for sapphire than for alumina but decreases with increasing fluence for both materials. Laser etching rates for the two materials are similar at high fluences and after the incubation period. Scanning electron microscope images show that alumina melts and flows under repeated irradiation at fluences (greater than or equal to 0.7 J/cm(exp 2). Atomic force microscopy and surface profilometry reveal significant smoothing of the as-received polycrystalline alumina surface after repeated irradiations at moderate fluences (approximately 1-3 J/cm(exp 2)). Ion probe measurements for alumina in vacuum confirm the incubation behavior, and reveal that at fixed fluence the (positive) charge collected per pulse saturates after a sufficient number of pulses, as does the etch-plume velocity. Results are interpreted in terms of laser-generation of a sufficient concentration of absorption centers before efficient ablation/etching of these wide bandgap materials can occur. DOE

N93-22517# Los Alamos National Lab., NM.
THE SURFACE INTERACTION OF OXYGEN WITH A GAMMA TiAl
T. N. Taylor and M. T. Paffett 1992 11 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract W-7405-eng-36)
(DE93-003847; LA-UR-92-3815; CONF-921101-3) Avail: CASI HC A03/MF A01

The composition and bonding of incipient and atmospheric oxides grown on a gamma-TiAl (2 at. percent Nb) were examined using Auger, x-ray, and low-energy ion scattering spectroscopies. The depth distribution of various components was determined with secondary-ion mass spectroscopy (SIMS). An oxide grown on the material in air at room temperature showed advanced Al and Ti oxide bonding states, which had very different stabilities during heating in vacuum up to 600 degrees C. The Ti-oxygen bonding state was markedly reduced while the Al oxide was somewhat enhanced during this process. Further controlled studies at 600 degrees C, involving oxygen adsorption below approximately 10(exp -6) Torr, showed an initial Al cation surface enrichment until the detectable Al 2p peak was 90 percent oxidized. Further oxygen exposure gradually produced a fully oxidized Ti valence state with a pronounced enrichment of the Ti cation at the vacuum-solid interface. The results are discussed in terms of the kinetic and thermodynamic factors of the rate-limiting steps in the oxidation process. DOE

DYNAMICS OF A METAL OVERLAYER ON METALLIC SUBSTRATES: HIGH TEMPERATURE EFFECTS
T. S. Rahman, J. E. Black (Brock Univ., Saint Catherines, Ontario.), and Zeng-Ju Tian (Brock Univ., Saint Catherines, Ontario.) 1992 7 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC02-76CH-00016)
(DE93-006382; BNL-48336; CONF-921101-68) Avail: CASI HC A02/MF A01

We have explored the structure and the dynamics of a bimetallic system consisting of a hexagonal (almost) overlayer of Ag on a square lattice (Ni(100) and Cu(100)), as a function of the surface temperature. In each case the structure is 'nearly' incommensurate giving rise to a low frequency Goldstone mode. Also, the overlayer atoms slosh back and forth over the substrate in a corrugated fashion. The calculated dispersion of the Ag/metal vertical mode, at room temperature, is in excellent agreement with experimental data. At higher temperatures floater atoms appear on top of the overlayer displaying a variety of cluster formations and also exchanges with the substrate atoms leading to surface disordering, interdiffusion and melting. DOE

CHARACTERIZATION AND DURABILITY TESTING OF PLASMA-SPRAYED ZIRCONIA-YTTRIA AND HAFNIA-YTTRIA THERMAL BARRIER COATINGS. PART 1: EFFECT OF SPRAY PARAMETERS ON THE PERFORMANCE OF SEVERAL LOTS OF PARTIALLY STABILIZED ZIRCONIA-YTTRIA POWDER
Robert A. Miller, George W. Leissler (Sverdrup Technology, Inc., Brook Park, OH.), and J. Marcus Jobe (Miami Univ., Oxford, OH.) Feb. 1993 34 p
(Contract NAS3-25266; RTOP 505-63-5A)
(NASA-TP-3295; E-7151; NAS 1.60:3295) Avail: CASI HC A03/MF A01

Initial experiments conducted on thermal barrier coatings prepared in the newly upgraded research plasma spray facility and the burner rig test facilities are discussed. Part 1 discusses experiments which establish the spray parameters for three baseline zirconia-yttria coatings. The quality of five similar coating lots was judged primarily by their response to burner rig exposure supplemented by data from other sources such as specimen characterizations and thermal diffusivity measurements. After allowing for burner rig variability, although there appears to be an optimum density (i.e., optimum microstructure) for maximum burner rig life, the distribution tends to be rather broad about the maximum. In Part 2, new hafnia-yttria-based coatings were evaluated against both baseline and alternate zirconia-yttria coatings. The hafnia-yttria coatings and the zirconia-yttria coatings that were prepared by an alternate powder vendor were very sensitive to plasma spray parameters, in that high-quality coatings were only obtained when certain parameters were employed. The reasons for this important observation are not understood. Also not understood is that the first of two replicate specimens sprayed for Part 1 consistently performed better than the second specimen. Subsequent experiments did not display this spray order affect, possibly because a chiller was installed in the torch cooling water circuit. Also, large changes in coating density were observed after switching to a new lot of electrodes. Analyses of these findings were made possible, in part, because of the development of a sensitive density measurement technique described herein in detail. The measured thermal diffusivities did not display the expected strong relationship with porosity. This surprising result was believed to have been caused by increased microcracking of the denser coatings on the stainless steel substrates. Author

CONTINUOUS PRODUCTION OF GRANULAR OR POWDER Ti, Zr, AND Hf OR THEIR ALLOY PRODUCTS Patent Application
Jack C. White, inventor (to Interior Dept.) and Laurance L. Oden, inventor (to Interior Dept.) 5 Oct. 1992 12 p
(PB93-135051; US-Patent-Appl-SN-956235; Pat-Appl-7-956235) Avail: CASI HC A03/MF A01

The invention relates to continuous production of granular titanium, zirconium or hafnium metal or their alloys by: dissolving reducing metals such as sodium, magnesium or lithium in their respective halide salts to produce a reducing molten salt process stream; preparing a second molten salt stream bearing Ti, Zr, or Hf in solution; mixing and reacting the two molten salt process streams in a continuous stirred tank reactor where control of the concentrations of reactants, the contacting pattern, and the temperature produce orderly growth of granular metal free of halide inclusions; removing granular metal from the system; and leaching the remaining salts from the granular metal. The Stress Corrosion Cracking (SCC) behavior of plate material of the alloys 7010-T7651 and -T73651 as well as 7050-T73651 was investigated in the short transverse direction performing accelerated tests under constant load, constant deformation, and slow strain rate conditions. Details of the corrosive environments and tests are given together with the results. In the short transverse direction, tensile tests reveal a big scatter of the ductility of the alloys investigated. Using statistical evaluation methods it was shown that this scatter is caused by inhomogeneous distribution of Fe and Si containing constituent particles. ESA

CHARACTERIZATION OF DOPED NiAl BY ATOM PROBE FIELD ION MICROSCOPY
R. Jayaram and M. K. Miller 1992 6 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-005932; CONF-921101-63) Avail: CASI HC A02/MF A01

The atom probe field ion microscope (APFIM) was used to characterize grain boundaries and matrix in NiAl doped with either boron, carbon or beryllium. Boron was observed to segregate to grain boundaries whereas carbon and beryllium did not. Atom probe analyses of the matrix revealed that the matrix was severely depleted of the solute in the boron- and carbon-doped alloys. Field ion imaging and matrix analyses also revealed ultrafine MB(sub 2) - and MC-type precipitates ranging in size between 2 run and 20 mm in diameter in the boron- and carbon-doped alloys. These precipitates occurred in significant number densities. Atom probe analyses of beryllium-doped NiAl did not reveal ultrafine precipitates and was consistent with the fact that almost all the beryllium was in solid solution. The enormous increase in yield stress in the boron- and carbon-doped alloys is predominantly due to a precipitation hardening effect. The small increase in yield stress in beryllium-doped NiAl is due to a mild substitutional solid solution hardening effect. DOE

INFLUENCE OF ADDITION ELEMENTS IN COPPER OR IMPLANTED IN ALUMINUM ON THE ADHESION TO THE SOLID STATE OF THE COPPER/ALUMINUM (Cu/Al2O3) SYSTEM Ph.D. Thesis [INFLUENCE DES ELEMENTS D'ADDITION DANS LE CUIVRE OU IMPLANTES DANS L'ALUMINE SUR L'ADHERENCE A L'ETAT SOLIDE DU SYSTEME CUIVRE/ALUMINE (CU/AL2O3)]
Nacer Ikhlef 1991 191 p In FRENCH Sponsored by Algerian Ministere de l'Enseignement Superieur
(ECL-91-34; ETN-93-91956) Avail: CASI HC A09/MF A02

Materials and experimental techniques, in particular, means implemented for the addition of new elements either to copper (copper alloys) or aluminum by ion implantation, as well as by mixing a thin deposit of copper onto the aluminum substrate using ion beams, are described. Devices for the preparation and characterization of Cu/Al2O3 are presented. The influence of the physiochemical state of copper on the mechanical resistance of the CuAl2O3 bondings is studied. The ceramic part of the bonding is studied: grazing incidence x-ray diffraction analysis of the superficial layers of aluminum implanted (in Zr and Cu) or mixed (with Cu), with and without heat treatment; and mechanical resistance of the superficially treated copper/aluminum bondings. ESA

We have constructed two experimental facilities during the term of this grant. In the first three years we constructed a helium atom scattering (HAS) facility with both elastic (EHAS) and inelastic (IHAS) scattering measurement capabilities to investigate the structural and dynamical aspects of solid surfaces and thin films. A pioneering surface metastable atom magnetic diffraction (SMAMD) facility was constructed and developed over the past four years, which makes possible the investigation of long-range electron spin-ordering on the surfaces of insulating magnetic crystals. The following were studied: H overlayers and Ag, Cu on Pd(111), reconstructed Au(111), and NiO(100). DOE

THEORETICAL STUDY OF ELECTRON-PHONON INTERACTION IN BETA-PHASE NiTi AND Ni-Al ALLOYS Ph.D. Thesis
Guang-Lin Zhao 17 Sep. 1992 88 p
(Contract W-7405-eng-82)
(DE93-004733; IS-T-1568) Avail: CASI HC A05/MF A01

The electronic band structure of (beta)-phase NiTi and NiAl was calculated using a first-principles LCAO method and then fitted by the nonorthogonal empirical tight binding method for the evaluation of electron-phonon (e-ph) matrix elements. Contribution of the e-ph interaction to phonon dynamical matrix was calculated by the method of Varma and Weber. It is found that an accurate calculation of e-ph interaction can explain the behavior of phonon anomalies in (beta)-phase NiTi and Ni-Al alloys. Fermi surface nesting and the symmetric properties of the e-ph interaction matrix elements are attributed as the source of the phonon anomalies and/or the soft phonon in these alloys. The temperature dependence of the phonon anomalies can be explained as a smearing effect of the Fermi surface. DOE

PECULIARITIES OF STRUCTURES AND MELTINGLIKE TRANSITION IN GOLD CLUSTERS
I. L. Garzon and J. Jellinek 1992 4 p Presented at the 6th International Symposium on Small Particles and Inorganic Clusters, Chicago, IL, 16-22 Sep. 1992

(Contract W-31-109-eng-38)
(DE93-004810; ANL/CHM/CP-77993; CONF-920921-8) Avail: CASI HC A01/MF A01

Structural and dynamical properties of gold clusters are derived from a Gupta-type potential using numerical simulations and are compared to features of nickel clusters derived from the same potential. The major implication of the comparison is that the properties of clusters mimicked by this many-body potential depend, in general, on the values of its parameters. DOE

SYNTHESIS, PROCESSING, AND PROPERTIES OF Ti5Si3
Y. Kim, A. J. Thom, and M. Akinc 1992 20 p Presented at the Minerals, Metals, and Materials Society/American Society for Metals (TMS/ASM) Materials Week 1992, Chicago, IL, 2-5 Nov. 1992
(Contract W-7405-eng-82)
(DE93-004465; IS-M-737; CONF-9211117-4) Avail: CASI HC A03/MF A01

Ti5Si3 was synthesized by arc melting of Ti and Si elemental powders. Ti5Si3 buttons were milled and sieved up to -325 mesh size powders, which were densified using HIPing. Microcracks in larger grains are observed for the HIPed microstructures with initial powder size of -325 mesh. Six hour milling of -325 mesh powder resulted in fine grain size (about 1 micron in diameter) with no microcracks after HIPing. Mechanical properties, such as hardness and fracture toughness, were measured for HIPed Ti5Si3. Thermal expansion coefficients along the a and c axis were measured as a function of temperature using a high temperature x-ray technique. Anisotropy in thermal expansion coefficient is believed to be one of the major causes for microcracks in larger grains. Oxidation behaviors of consolidated Ti5Si3 were investigated in terms of weight changes at 1000 C in air. DOE

MICROSTRUCTURE OF RAPIDLY-SOLIDIFIED LITHIUM POWDERS
M. D. Kass Dec. 1992 11 p
(Contract DE-AC05-84OS-21400)
(DE93-004765; Y/DZ-885) Avail: CASI HC A03/MF A01

Efforts are currently being made to produce lithium hydride powders by rapid solidification techniques. Two methods under investigation are gas atomization and melt spinning. Gas atomization produces powders having spherical morphology, while melt spinning produces ribbons which are ground into angular powder using a grinding mill. Both powder types are characterized for chemical, physical, and mechanical properties. The microstructures of the powders are currently being extensively analyzed. Rapid solidification techniques were used to form new phases, control particle size, control particle morphology, provide homogeneity of microstructure, and, most importantly, to produce fine grains. Although rapid solidification technologies are well established in the metal industry, very little research or development has been done on applying these processes to ceramic materials. DOE

POSTIRRADIATION DEFORMATION BEHAVIOR IN FERRITIC Fe-Cr ALLOYS
M. L. Hamilton, D. S. Gelles, and P. L. Gardner (Missouri Univ., Rolla.) Jun. 1992 17 p Presented at the 16th Annual Symposium of American Society of Testing and Materials (ASTM) on Effects of Radiation on Materials, Denver, CO, 21-25 Jun. 1992
(Contract DE-AC06-76RL-01830)
(DE93-004833; PNL-SA-20060; CONF-920673-15) Avail: CASI HC A03/MF A01

It has been demonstrated that fast-neutron irradiation produces significant hardening in simple Fe-(3-18)Cr binary alloys irradiated to about 35 dpa in the temperature range 365 to 420 C, whereas irradiation at 574 C produces hardening only for 15 percent or more chromium. The irradiation-induced changes in tensile properties are discussed in terms of changes in the power law work-hardening exponent. The work-hardening exponent of the lower chromium alloys decreased significantly after low-temperature irradiation (less than or = 420 C) but increased after irradiation at 574 C. The higher chromium alloys failed either in cleavage or in a mixed ductile/brittle fashion. Deformation microstructures are presented to support the tensile behavior. DOE

MECHANICAL PROPERTIES OF MARTENSITIC ALLOY AISI 422
M. L. Hamilton, F. H. Huang (Westinghouse Hanford Co., Richland, WA.), and Wan-Liang Hu (Westinghouse Hanford Co., Richland, WA.) Jun. 1992 15 p Presented at the 16th Annual Symposium of American Society of Testing and Materials (ASTM) on Effects of Radiation on Materials, Denver, CO, 21-25 Jun. 1992
(Contract DE-AC06-76RL-01830)
(DE93-004834; PNL-SA-19953; CONF-920673-14) Avail: CASI HC A03/MF A01

HT9 is a martensitic stainless steel that has been considered for structural applications in liquid metal reactors (LMRs) as well as in fusion reactors. AISI 422 is a commercially available martensitic stainless steel that closely resembles HT9, and was studied briefly under the auspices of the U.S. LMR program. Previously unpublished tensile, fracture toughness and charpy impact data on AISI 422 were re-examined for potential insights into the consequences of the compositional differences between the two alloys, particularly with respect to current questions concerning the origin of the radiation-induced embrittlement observed in HT9. MECHANICAL PROPERTIES OF FERRITIC AND FERRITIC-PEARLITIC DUCTILE IRON
I. H. Frenz (Bundesanstalt fuer Materialpruefung, Berlin, Germany.) Feb. 1993 141 p
(Contract DE-AC04-76DP-00789)
(DE93-007670; SAND-92-0421; TTC-0421) Avail: CASI HC A07/MF A02

A statistical analysis of test results on 1000 transportation and storage casks revealed the main parameters that determine the properties of DI (ductile iron, a special form of cost iron). These data were used to establish a test program in which the mechanical properties (particularly fracture toughness) of 24 DI alloys were determined as a function of their microstructure. Furthermore, the analysis emphasized the effect of test specimen size and different test data evaluation methods. Results of the test program show the prominent effect of pearlite content and graphite nodule structure in the mechanical and fracture toughness characteristics of DI. As the first-order parameter, the pearlite content is responsible for the transition from linear-elastic to elastic-plastic material behavior. The structure of the graphite nodules has a strong effect on the magnitude of the material property values. On the lower shelf, materials with small, homogeneously distributed graphite nodules show higher K(sub IC)-values (matrix-oriented fracture). On the upper shelf, materials with larger graphite nodules show higher fracture toughness (graphite-oriented fracture). With smaller specimens, conservative values were calculated on the upper shelf. This is important for transportation and storage containers of radioactive materials. DOE

FORMABILITY OF TYPE 304 STAINLESS STEEL SHEET
G. J. Coubrough, D. K. Matlock (Colorado School of Mines, Golden.), and C. J. VanTyne (Colorado School of Mines, Golden.) 1992 30 p Presented at the SAE Advanced Sheet Metal Forming Technology Conference, Detroit, MI, 1-6 Mar. 1993
(Contract DE-AC34-90DP-62349)
(DE92-018619; RFP-4607; CONF-930330-1) Avail: CASI HC A03/MF A01

Punch-stretch tests to determine formability of type 304 stainless steel sheet were conducted using a hemispherical dome test. Sheets of 19.1 mm width and 177.8 mm width were stretched on a 101.6 mm diameter punch at punch rates between 0.042 to 2.12 mm/s with three lubricant systems: a mineral seal oil, thin polytetrafluoroethelyne sheet with mineral seal oil, and silicone rubber with mineral seal oil. The resulting strain distributions were measured, and the amount of martensite was determined by magnetic means. Increasing lubricity resulted in more uniform strain distributions while increased punch rates tended to decrease both strain and transformation distributions. High forming limit values were related to the formation of high and uniformly distributed martensite volume fractions during deformation. The results of this study are interpreted with an analysis of the effects of strain and temperature on strain induced martensite formation in metastable austenitic stainless steels. DOE

AMORPHIZATION KINETICS OF Zr(Cr,Fe)2 UNDER ION IRRADIATION
A. T. Motta (Pennsylvania State Univ., University Park.), L. M. Howe (Atomic Energy of Canada Ltd., Chalk River, Ontario.), and P. R. Okamoto Dec. 1992 7 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract W-31-109-eng-38)
(DE93-005560; ANL/MSD/CP-78354; CONF-921101-58) Avail: CASI HC A02/MF A01

Thin foils of Zircaloy-4 were irradiated with 350 KeV Ar-40 ions in the dual ion beam/HVEM facility at Argonne National Laboratory at 300-650 K. The irradiation-induced amorphization of the intermetallic precipitates Zr (Cr, Fe)2 and Zr2 (Ni, Fe) was studied in-situ. For Zr (Cr, Fe)2 precipitates the dose-to-amorphization was found to increase exponentially with temperature, with a critical temperature of about 650 K. The amorphization morphology was shown to be homogeneous, with no preferential site for nucleation, in contrast to neutron-irradiation amorphization which started at the precipitate-matrix interface. For Zr2 (Ni,Fe) precipitates it was found that amorphization occurred at 550 and 600 K, whereas in neutron irradiation no amorphization has been observed at those temperatures. The results are discussed in context of previous neutron and electron irradiations and likely amorphization mechanisms are proposed. DOE

MOLECULAR DYNAMICS SIMULATION OF RADIATION-INDUCED AMORPHIZATION OF THE ORDERED COMPOUND NiZr2
R. Devanathan, N. Q. Lam, P. R. Okamoto, and M. Meshii (Northwestern Univ., Evanston, IL.) Dec. 1992 7 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract W-31-109-eng-38)
(DE93-005558; ANL/MSD/CP-76613; CONF-921101-38) Avail: CASI HC A02/MF A01

We have studied the electron irradiation-induced amorphization of the ordered intermetallic compound NiZr2 by molecular dynamics simulations in conjunction with embedded-atom potentials. Randomly chosen Frenkel pairs and chemical disorder were introduced into the system in separate processes. In both cases, the energy and volume of the system rose above the corresponding levels of a quenched liquid and the calculated diffraction patterns indicated the occurrence of a crystalline-to-amorphous transition. In addition, the average shear elastic constant fell to about 50 percent of its value in the perfect crystal and the system became elastically isotropic. These results indicate that NiZr2 can be amorphized by chemical disorder as well as Frenkel pairs and are in good agreement with experimental observations. DOE

KINETIC ENERGY DISTRIBUTIONS OF SPUTTERED NEUTRAL ALUMINUM CLUSTERS: Al-Al6
S. R. Coon, W. F. Calaway, M. J. Pellin, G. A. Curlee (Trinity Univ., San Antonio, TX.), and J. M. White (Texas Univ., Austin.) 1992 26 p Presented at the Symposium on Sputtering, Copenhagen, Denmark, 30 Aug. - 4 Sep. 1992
(Contract W-31-109-eng-38)
(DE93-004815; ANL/CHM/CP-76899; CONF-9208147-2) Avail: CASI HC A03/MF A01

Neutral aluminum clusters sputtered from polycrystalline aluminum were analyzed by laser postionization time-of-flight (TOF) mass spectrometry. The kinetic energy distributions of Al through Al6 were measured by a neutrals time-of-flight technique. The interpretation of laser postionization TOF data to extract velocity and energy distributions is presented. The aluminum cluster distributions are qualitatively similar to previous copper cluster distribution measurements from our laboratory. In contrast to the steep high energy tails predicted by the single- or multiple- collision models, the measured cluster distributions have high energy power law dependences in the range of E(sup -3) to E(sup -4.5). Correlated collision models may explain the substantial abundance of energetic clusters that are observed in these experiments. Possible influences of cluster fragmentation on the distributions are discussed. DOE

COMPARISON OF BISMUTH-LEAD AND BISMUTH-TIN TO TIN-LEAD AS ALTERNATE SOLDER ALLOYS
G. A. Becka Dec. 1992 43 p
(Contract DE-AC04-76DP-00613)
(DE93-006041; KCP-613-4996) Avail: CASI HC A03/MF A01

Bismuth-based alloys (Bi55.5-Pb44.5 and Bi58-Sn42) were evaluated as potential solder alloys by comparing certain metallurgical properties to Sn63-Pb37. This study shows that the two Bi-alloys are more creep-prone than Sn63. Also, both Bi-alloys are rapidly damaged by thermal cycling. Bi-Pb is a poor alternate solder alloy for high-reliability electronic solder joints. If Bi58-Sn42 is selected, the application should be thoroughly investigated to ensure metallurgical reliability. CHARACTERIZATION OF SAES St198 ZIRCONIUM-IRON-TIN ALLOY
W. C. Mosley 13 Oct. 1992 15 p
(Contract DE-AC09-89SR-18035)
(DE93-005697; WSRC-TR-92-483) Avail: CASI HC A03/MF A01

A waste minimization program to develop a non-oxidative stripper system based on metallic getters is being conducted. Initial development is being performed using a Zr-Fe-Sn intermetallic alloy getter procured as St198 from SAES Getters/USA., Inc. This memorandum describes characterizations of physical and compositional properties of SAES St198. SAES St198 getter was supplied as very durable, cylindrical pellets made by compaction of granules of Zr-Fe-Sn alloy up to 150 micron in size. Pellet density was 5.2 g/mL corresponding to 24.8 percent open porosity and very little closed porosity. Bulk composition of St198 was 73.6 weight percent (w/o) Zr, 23.3 w/o Fe and 1.2 w/o Sn. St198 consists of Zr2Fe primary phase along with four secondary phases (ZrFe2, Zr5FeSn, alpha-zirconium, and eta-Zr4Fe2O(0.6)). Hydriding characteristics of St198 are expected to differ slightly from those of Zr2Fe because (alpha)-zirconium and, possibly, Zr5FeSn also react with hydrogen. DOE

The NASA-UVA Light Aerospace Alloy and Structures Technology (LA(2)ST) Program continues a high level of activity, with projects being conducted by graduate students and faculty advisors in the Departments of Materials Science and Engineering, Civil Engineering and Applied Mechanics, and Mechanical and Aerospace Engineering at the University of Virginia. This work is funded by the NASA-Langley Research Center under Grant NAG-1-745. We report on progress achieved between July 1 and December 31, 1992. The objective of the LA(2)ST Program is to conduct interdisciplinary graduate student research on the performance of next generation, light weight aerospace alloys, composites and thermal

gradient structures in collaboration with NASA-Langley researchers. Specific technical objectives are presented for each research project. We generally aim to produce relevant data and basic understanding of material mechanical response, corrosion behavior, and microstructure; new monolithic and composite alloys; advanced processing methods; new solid and fluid mechanics analyses; measurement advances; and critically, a pool of educated graduate students for aerospace technologies.

PILOT DEMONSTRATION OF CERIUM OXIDE COATED ANODES Progress Report
J. S. Gregg, M. S. Frederick, M. J. Shingler, and T. R. Alcorn Oct. 1992 216 p
(Contract DE-FC07-90ID-12940)
(DE93-002507; DOE/ID-12940/1) Avail: CASI HC A10/MF A03

Copper cermet anodes were tested for 213 to 614 hours with an in-situ deposited CEROX coating in a pilot cell operated by Reynolds Manufacturing Technology Laboratory. At high bath ratio (approx. 1.5) and low current density (0.5 A/sq cm), a greater than or equal to 1 mm thick dense CEROX coating was deposited on the anodes. At lower bath ratios and higher current density, the CEROX coating was thinner and less dense, but no change in corrosion rate was noted. Regions of low current density on the anodes and sides adjacent to the carbon anode sometimes had thin or absent CEROX coatings. Problems with cracking and oxidation of the cermet substrates led to higher corrosion rates in a pilot cell than would be anticipated from lab scale results. DOE

With the eddy current method it is possible to find and analyze surface defects of electrically conducting components. The method is most suitable for testing the components with simple geometries (sheets, tubes, threaded bolts). The sensitivity of several eddy current transducers was studied when the depth and length of the artificial surface defects change. The material of the specimens was austenitic steel. The artificial defects were narrow notches, closely resembling fatigue cracks. The defects were produced by the spark erosion technique. The effects of the liftoff and the angle of the transducer were studied. The 'noise level' due to geometrical and material inhomogeneity was measured. The transducers were of a commercial type. ESA

(NASA-TM-105961; E-7538; NAS 1.15:105961) Avail: CASI HC A03/MF A01

A Pd-13 wt. percent Cr solid solution is a promising high-temperature strain gage alloy. In bulk form it has a number of properties that are desirable in a resistance strain gage material, such as a linear electrical resistance versus temperature curve to 1000 C and stable electrical resistance in air at 1000 C. However, unprotected fine wire gages fabricated from this alloy perform well only to 600 C. At higher temperatures severe oxidation degrades their electrical performance. In this work Auger electron spectroscopy was used to study the oxidation chemistry of the alloy wires and ribbons. Results indicate that the oxidation is caused by a complex mechanism that is not yet fully understood. As expected, during oxidation, a layer of chromium oxide is formed. This layer, however, forms beneath a layer of metallic palladium. The results of this study have increased the understanding of the oxidation mechanism of Pd-13 wt. percent Cr.

ELEVATED TEMPERATURE FRACTURE OF ADVANCED POWDER METALLURGY ALUMINUM ALLOY 8009 Ph.D. Thesis
William C. Porr, Jr. 1992 184 p
Avail: Univ. Microfilms Order No. DA9237626

Tensile and fracture toughness experiments were conducted on rapidly solidified, powder metallurgy processed 8009 (Al-8.5Fe-1.3V-1.7Si, wt percent). 8009 has high intrinsic initiation (K(sub IC)) and crack growth (T(sub R)) fracture toughnesses at 25 C, that decrease with increasing temperature and decreasing loading rate. K(sub IC) sharply decreases with increasing temperature from 25 to 175 C (from 33 to 15 MPa square root of m), and continues to gradually decrease with increasing temperature from 175 to 316 C (10 MPA square root of m). T(sub R) decreases to a minimum at 175 to 200 C, before increasing at higher temperatures. The tensile ductility of 8009, given by smooth and notched specimen area reductions, mirrors the temperature dependence of fracture toughness. Decreased loading rate at constant temperature has a similar effect as increasing temperature on the fracture toughness. SEM fractography indicated a change in the microscopic fracture mechanism of 8009 with increasing temperature and decreasing loading rate. At 25 C with moderate loading rates, a dual size distribution of microvoids was observed; large voids nucleated first at oxide particles, while small voids nucleated at dispersoids and contributed to a void sheeting fracture mechanism. At higher temperatures or lower loading rates, a single void size was observed, with voiding associated with nucleation at oxide particles in 8009. For the low toughness conditions, voids were shallow possibly due to cracking along localized slip bands. Micromechanical modelling accurately predicted the measured trends in K(sub IC) and T(sub R) with increasing temperature. The critical intrinsic variables controlling toughness behavior identified by the modelling was the high constraint crack tip strain, epsilon(sub f)*. Several mechanisms for the unusual fracture toughness and ductility degradation in 8009 were critically evaluated, including: dynamic strain aging due to excess solid solution iron, extrinsic delamination toughening, environmental embrittlement due to water vapor or oxygen reactions with aluminum, embrittlement by retained hydrogen from processing, or temperature enhanced localized deformation unique to ultrafine grain size alloys with a high volume fraction of strengthening dispersoids. The most likely mechanism for the degradation of fracture toughness and ductility in 8009 is a temperature and strain rate dependent transition in dispersoid-dislocation interactions. Dissert. Abstr.

MICROSTRUCTURE AND TEXTURE CONTROL OF FATIGUE IN HYDROGEN AND MARINE ENVIRONMENTS Fiscal Year Letter, 1 Oct. 1991 - 30 Sep. 1992
William W. Gerberich 30 Sep. 1992 9 p
(AD-A259808) Avail: CASI HC A02/MF A01

It is currently not understood how the anisotropic elastic, plastic and fracture characteristics interact with environment to limit fatigue life in a corrosive medium. This program examines how texture and anisotropic slip character interact in two general classes of BCC iron base and HCP titanium bare alloy systems. Selected area electron channeling, transmission electron microscopy, atomic force microscopy, continuous microindentation and fracture micromechanic methods are being utilized to evaluate microstructural and surface layer effects on environmentally-induced fatigue initiation. In addition, as it is essential to understand the transition from small crack to long crack behavior, additional threshold studies on both Fe-Si and HSLA polycrystals need to be accomplished. In this way, the various stages of nucleation and growth may be combined together for life prediction. The objective is to provide a partial basis for alloy and materials processing design against fatigue in a marine environment. GRA

MEASUREMENT OF THE RADIATIVE TRANSPORT PROPERTIES OF RETICULATED ALUMINA FOAMS
M. J. Hale and M. S. Bohn Dec. 1992 11 p Presented at the International American Society of Mechanical Engineers/ASES (ASME/ASES) Joint Solar Energy Conference, Washington, DC, 4-9 Apr. 1993
(Contract DE-AC02-83CH-10093)

(DE93-000047; NREL/TP-432-5071; CONF-930435-3) Avail: CASI HC A03/MF A01

This paper presents a method for determining radiative transport properties of reticulated materials. The method has both experimental and analytical components. A polar nephelometer is used to measure the scattering profile of a sample of the reticulated material. The results of a Monte Carlo simulation of the experiment are then combined with the experimental results to give the scatter albedo and extinction coefficient. This paper presents the results of using this method to determine the radiative transport properties of four different porosities (10, 20, 30, 65 pores per inch) of cylindrical reticulated alumina samples ranging in thickness from 0.5 inches to 2.5 inches. RESIDUAL STRESS MEASUREMENTS IN CONTINUOUS FIBER TITANIUM MATRIX COMPOSITES
M. R. James (Rockwell International Corp., Thousand Oaks, CA.), M. A. Bourke, J. A. Goldstone, and A. C. Lawson 1992 9 p Presented at the Annual Denver X Ray Conference, Denver, CO, 3-7 Aug. 1992
(Contract W-7405-eng-36)
(DE93-003733; LA-UR-92-3368; CONF-9208129-10) Avail: CASI HC A02/MF A01

Metal matrix composites develop residual strains after consolidation due to the thermal expansion mismatch between the reinforcement fiber and the matrix. X-ray and neutron diffraction measured values for the longitudinal residual stress in the matrix of three titanium MMCs are reported. For thick composites (greater than 6 plies) the surface stress measured by x-ray diffraction matches that determined by neutron diffraction and therefore represents the stress in the bulk region consisting of the fibers and matrix. For thin sheet composites, the surface values are lower than that in the interior and increase as the outer rows of fibers are approached. While a rationale for this behavior has yet to be developed, accounting for composite thickness is important when using x-ray measured values to validate analytic and finite element calculations of the residual stress state. NON-CHROMATED SURFACE PRETREATMENTS FOR ALUMINUM Interim Report, Oct. 1989 - Jun. 1992
Stephen J. Spadafora 18 Aug. 1992 44 p
(AD-A260130; NAWCADWAR-92077-60) Avail: CASI HC A03/MF A01

Chromates, particularly chromium VI, have been widely used in aerospace processes and materials due to their excellent performance as corrosion inhibitors. These processes range from inorganic pretreatment processes (alkaline cleaners, deoxidizers, conversion coatings, etc.) to organic protective coatings (primers, sealants, fuel tank coatings, etc.). Recently, regulatory agencies have enacted legislation to limit or prohibit the use and disposal of chromium containing materials because chromium VI is now a known carcinogen. These rules affect the majority of the pretreatment processes used on naval aircraft, necessitating the development of non-chromated replacements for the current materials. After an extensive research and development effort, several promising alternatives to chromated alkaline cleaners, deoxidizers, and conversion coatings have been identified. As a result of this work, implementation of non-chromate cleaning and deoxidizing materials at Naval Aviation Depots have already resulted in significant cost savings in both processing and waste disposal. Full implementation of these alternatives at all naval levels of maintenance (organizational, intermediate, and depot facilities) will result in a major reduction of hazardous waste generated by the Navy. This report describes the RDT and E effort to develop these non-chromated alternatives. GRA

COPPER/SOLDER INTERMETALLIC GROWTH STUDIES Interim Report, Oct. 1991 - May 1992
Kevin W. Kirchner, George K. Lucey, and James Geis Dec. 1992 14 p
(AD-A259856; ARL-TR-32) Avail: CASI HC A03/MF A01

A summary of initial findings from a series of experiments involving copper/solder intermetallic compounds (IMC's) is presented. Particularly the study examines the IMC's contribution to the changing physical properties of a solder joint as a function of time and temperature. In these experiments Cu/Sn joint samples were placed in the hot stage of an environmental scanning electron microscope, heated to about 170 C, and monitored for about 3 hr. A visual documentation of events is included. A real-time videotape record of the IMC growth was produced. Additionally a working hypothesis is presented that involves the relationship between IMC's and the mechanical properties of joints. GRA

BEND DUCTILITY OF TUNGSTEN HEAVY ALLOYS
W. E. Gurwell, M. R. Garnich, G. B. Dudder, and C. A. Lavender Nov. 1992 12 p Presented at the 1992 International Conference on Tungsten and Tungsten Alloys, Arlington, VA, 15-18 Nov. 1992
(Contract DE-AC06-76RL-01830)
(DE93-004839; PNL-SA-21555; CONF-9211158-2) Avail: CASI HC A03/MF A01

A bend ductility test is used to indicate the formability of tungsten heavy alloys sheet. The primary test bends a notchless Charpy impact specimen to a bend angle of approximately 100 deg. This can be augmented by a bend-completion test. Finite element modeling as well as strain-gaged bend specimens elucidate the strain distribution in the specimen as a function of material thickness and bend angle. The bend ductilities of 70, 80, and 90 percent W alloys are characterized. As expected, decreasing thickness or tungsten content enhances bend ductility. Oxidation is not detrimental; therefore, controlled atmosphere is not required for cooling. The potentially detrimental effects of mechanical working (e.g., rolling, roller-leveling, grit blasting, and peening) and machining (e.g., cutting and sanding) are illustrated. DOE

EFFECTS OF ROLLING ON THE DUCTILITY OF 80 PERCENT TUNGSTEN HEAVY ALLOY
C. A. Lavender and W. E. Gurwell Nov. 1992 10 p Presented at the 1992 International Conference on Tungsten and Tungsten Alloys, Arlington, VA, 15-18 Nov. 1992
(Contract DE-AC06-76RL-01830)
(DE93-004840; PNL-SA-21556; CONF-9211158-1) Avail: CASI HC A02/MF A01

Relations between transverse tensile ductility and rolling and annealing schedules were investigated for solid-state sintered and annealed (80)W(8)Ni(2)Fe heavy alloy rolled at 900 C or 1150 C with varying reductions between anneals at either 1150 C or 1400 C. Final anneals and a solution heat treatment were employed prior to tensile testing. Metallographic and fractographic analyses were performed to determine relations between microstructure and physical properties. Multiple 1400 C intermediate anneals with a maximum 60 percent rolling reduction produced higher transverse tensile elongations than rolled with a higher final reduction, 86 percent. Tensile elongation differences were attributed to the recrystallized intra-particle W grain sizes achieved during the final anneal. Materials given a maximum of 60 percent reduction before final anneal had fewer intra-particle W grains and therefore higher ductilities. For materials rolled at 900 C or 1150 C, no differences in transverse tensile elongation were observed. 1150 C intermediate anneals had consistently lower ductility. 900 C rolling produced slightly higher elongations than 1150 C rolling, but only when the material was annealed at 1455 C. Tensile yield and ultimate strengths did not vary greatly with rolling and intermediate annealing conditions. The edge cracking correlated with observed lateral spread and the material softness. DOE

GRAIN BOUNDARY CHEMISTRY EFFECTS ON ENVIRONMENT-INDUCED CRACK GROWTH OF IRON-BASED ALLOYS
R. H. Jones Nov. 1992 8 p Presented at the Minerals, Metals, and Materials Society/American Society for Metals (TMS/ASM) Materials Week 1992, Chicago, IL, 2-5 Nov. 1992
(Contract DE-AC06-76RL-01830)
(DE93-005039; PNL-SA-21327; CONF-9211117-3) Avail: CASI HC A02/MF A01

Relation between grain boundary chemistry and environment-induced crack growth of Fe-based alloys is reviewed. The importance of the cleanliness of steels is clearly demonstrated by direct relations between grain boundary chemistry and crack growth behavior for both H and anodic dissolution-induced crack growth. Relationships between strain to failure, work of fracture, K(sub ISCC), crack velocity and fracture mode and grain boundary chemistry are presented. Only results in which the grain boundary

chemistry has been measured directly by Auger electron spectroscopy (AES) on intergranular surfaces exposed by in situ fracture have been considered in this review. DOE

IDENTIFICATION OF SPECIFIC PROTEIN MARKERS THAT CORRELATE WITH INITIATION AND PROGRESSION OF MICROBIALLY INFLUENCED CORROSION Final Report
Victoria Gonzales-Prevatt 1992 34 p
(Contract N00014-92-C-0063)
(AD-A258453) Avail: CASI HC A03/MF A01

The feasibility of using sodium dodecyl sulfate polyacrylamide gel electrophoresis and 2-dimensional gel electrophoresis as techniques for identification of specific protein markers that correlate with initiation and progression of microbially influenced corrosion was demonstrated during phase 1. Results showed that proteins can be detected in extracts of oil pipeline pigging solids and in concentrated water samples from locations where corrosion coupon data show evidence of corrosion. Different protein banding patterns were observed for samples collected from different locations. Samples collected from the same location at different times also showed a slight change in banding pattern. These results are significant because changes in protein banding patterns can be indicative of changes in microbioal populations or of metabolic activities associated with initiation of microbially influenced corrosion (MIC). Capability to detect proteins in water samples is especially significant because identification of markers in the water will provide the earliest indication of MIC. The need for optimizing sample preparation procedures to remove interfering components and conditions for 2-D electrophoresis to obtain maximum resolution was discussed. Recommendations for future research in phase 2 that would lead to development of a simple and economical diagnostic procedure for early identification of MIC were made. Author

ANALYSIS OF RESIDUAL PHASES IN NICKEL ALUMINIDE POWDERS PRODUCED BY REACTION SYNTHESIS
K. P. McCoy, K. G. Shaw, and J. A. Trogolo (Rensselaer Polytechnic Inst., Troy, NY.) 1992 6 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-FG01-91CE-15492)
(DE93-005680; CONF-921101-34) Avail: CASI HC A02/MF A01

The use of x-ray diffraction has been used to determine phases present after reaction synthesis of Ni3Al powder. The complex diffraction spectra produced by the powder prompted the development of a simulator. The simulator uses nonlinear regression to determine the weight percent of the phases present. The simulator also determines the broadening of each peak in the spectrum. The phases present in Ni3Al powder produced by reaction synthesis has been determined with the simulator. The simulator has been used to monitor the progress of phase transformation during various thermal treatments of Ni3Al powder. A thermal cycle of 1200 C for two hours has been shown to produce a phase-pure product. The activation energy for the interdiffusion of nickel and aluminum has been determined to be 260 + or - 35 kJ/mole. DOE

SOLUTE BINDING AT VOID SURFACES IN SILICON AND GERMANIUM
S. M. Myers, D. M. Bishop, D. M. Follstaedt, H. J. Stein, and W. R. Wampler 1992 8 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC04-76DP-00789)
(DE93-004504; SAND-92-1443C; CONF-921101-17) Avail: CASI HC A02/MF A01

The strongly exothermic reactions of H and Cu with internal surfaces in Si and Ge were examined in experiments employing ion implantation, ion-beam analysis, transmission electron microscopy, and infrared spectroscopy. The dissociation energy of the Si-H surface bond was determined to be 2.6 +/- 0.1 eV, making the monohydride more stable than the molecular H2, whose dissociation energy per atom is 2.26 eV. Initial experiments indicate a dissociation energy for the Ge-H surface bond of approx 1.9 eV. Copper is bound to the Si surface with an energy of 2.2 +/- 0.2 eV relative to the sqlution state, as compared to a reported binding energy of 1.5 eV for Cu in the precipitated Cu3Si phase. DOE

A STUDY INTO THE EFFECTS OF ELECTRIC FIELDS AND CURRENTS ON THE AGING AND QUENCH HARDENING OF STEELS Final Report
Hans Conrad 15 Jan. 1993 78 p
(Contract DAAL03-89-K-0115)
(AD-A260228; ARO-26825.21-MS) Avail: CASI HC A05/MF A01

Studies were conducted on the effects of an internal electric current and an external electric field on the mechanical properties of metals and on solid state transformations therein, giving attention to the quench aging of a low-carbon steel and the hardenability of a tool steel. A continuous d.c. current of approximately 10(exp 3) A/cm(sup 2) increased the rate of quench aging at 80 C, whereas an a.c. current of the same magnitude and a frequency of 50-100 Hz dramatically suppressed the aging. An external electric field of approximately 14 kV/cm retarded the quench aging by altering the nature of the precipitation process. Regarding hardenability, an external electric field of 1 kV/cm increased the hardenability of a tool steel by shifting the CT curve to longer times. It was further established that high density d.c. pulses (greater than or equal to 10(exp 3) A/cm(sup 2) of approximately 100 microns duration) increased the plastic strainrate of metals by orders of magnitude, increased fatigue life, and enhanced the rates of recovery and recrystallization but retarded grain growth. An external electric field of approx. 1 kV/cm reduced the flow stress during the superplastic deformation of 7475 Al, retarded grain growth, and significantly reduced the cavitation. The effects of the electric current and external field on the various phenomena are explained in terms of their influence on the mobility of point (vacancies and solute atoms) and line (dislocation) crystal defects. A NEW INDEX FOR THE CREVICE CORROSION RESISTANCE OF MATERIALS
Yuan Xu and Howard W. Pickering Feb. 1993 21 p
(Contract N00014-91-J-1189)
(AD-A260437) Avail: CASI HC A03/MF A01

Recent studies have revealed the crucial role played by the macro corrosion cell (potential coupling between the inside and outside of a cavity) in crevice and pitting corrosion. It was found that acidification and the existence of chloride ions in the local cell are not the sole and necessary conditions for localized corrosion to occur, and that their accelerating effects on crevice corrosion and pit growth can be explained within the framework of the macro cell (the IR drop mechanism). Upon analysis of the results of the experiments, quantitative modeling, and the literature, a new characteristic parameter the critical distance into the crevice, d(sub c), was suggested for indexing the crevice corrosion resistance of a material under specified conditions. The advantages of using d(sub c) as the index of the crevice corrosion resistance are: (1) it may be obtained through experiment and may also be estimated through computational approaches; (2) it has a distinct and straightforward physical meaning; (3) it may be employed in engineering design; and (4) it is a single parameter which can reflect the integrated influence of several factors known to affect the crevice corrosion resistance of a material from past practical experience and research work. Preliminary work has shown good agreement

between the measured and the computed values of d(sub c). The experimental technique and the principle of the mathematical approach to obtain d(sub c) are described. GRA

SEQUENTIAL DEPOSITION OF COPPER ON SOLID GOLD (111): A STATISTICAL MODEL
L. Blum and Dale A. Huckaby 15 Jan. 1993 13 p Prepared in cooperation with Texas Christian Univ., Fort Worth
(Contract N00014-90-J-1263)
(AD-A260269; TR-22) Avail: CASI HC A03/MF A01

Phase transitions occurring during electrode processes have been studied using a model in which the electrode is a planar wall with sticky adsorption sites. This model is used to explain the underpotential deposition (UPD) of copper on gold (111) in the presence of bisulfate ions. The model assumes that the bisulfate ions form a template for the adsorption of the first 2/3 of a monolayer of copper onto a honeycomb lattice. The centers of the hexagons that form the honeycomb are occupied by the bisulfate. In the absence of copper the bisulfate is desorbed as the electrode becomes more negatively charged, and for that reason the template 'melts' when the fraction of occupied sites drops below a certain critical value, which is estimated using the hard hexagon model. We assume strong copper-bisulfate coadsorption, so that in the presence of a sufficiently large amount of Cu the template is reconstructed. Our model explains the qualitative features of the voltammogram, and makes definite predictions for the structure that should be observed. GRA

A MODEL FOR VOLTAMMOGRAMS OF THE UNDER-POTENTIAL DEPOSITION OF COPPER ON SOLID GOLD (111) IN THE PRESENCE OF BISULFATE
L. Blum and Dale A. Huckaby 15 Jan. 1993 15 p
(Contract N00014-90-J-1263)
(AD-A260309; TR-24) Avail: CASI HC A03/MF A01

A model for the underpotential deposition of Cu on Au(111) in the presence of H2SO4, was recently proposed. In this model we assumed that the HSO4(-) ions formed a square root of 3 x square root of 3 lattice which produced a honeycomb template for the deposition of the copper. This results in the electrodeposition of about 3/3 of the copper of a monolayer, corresponding to the first peak in the voltammogram. The second peak, of about 1/3 of the Cu of the full monolayer, is due to the displacement of the HSO4(-), by copper. In our previous work we assumed that the HSO4(-), template was in place during the whole electrodeposition process. However, from recent experimental evidence we know that this is not so. An improved effective field model in which the electrodeposition potential of the HSO4(-) changes with the amount of adsorbed copper is suggested. This new model reproduces the shape of the first peak of the voltammogram, and explains the transition of a broad peak to a narrow one by a second order phase transition (hard hexagon model) of the adsorbed HSO4(-). RELATING POROSITY AND MECHANICAL PROPERTIES IN SPRAY FORMED ALLOY 625 Research Report, Feb. - Oct. 1992
R. D. Payne, A. L. Moran, and R. C. Cammarata 27 Oct. 1992 20 p
(AD-A260341; CDNSWC/SME-92-54) Avail: CASI HC A03/MF A01

Previous studies of spray formed material at the Carderock Division, Naval Surface Warfare Center, Annapolis Detachment, have indicated that porosity is one of the few component characteristics affected by changes in process parameters. As a result, porosity has often been directly linked to quality. The relationship between porosity and mechanical properties is examined in an effort to prove that porosity does indeed indicate quality. In general, increases in porosity lead to decreases in strength and hardness. This allows the generalization that higher porosity levels indicate lower quality material. GRA

ACCEPTABLE ALUMINUM ADDITIONS FOR MINIMAL ENVIRONMENTAL EFFECT IN IRON-ALUMINUM ALLOYS
Vinod K. Sikka, Srinath Viswanathan, and Sanjay Vyas (Carnegie-Mellon Univ., Pittsburgh, PA.) 1992 6 p Presented at the Materials Research Society (MRS) Symposium, Boston, MA, 2-6 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-006738; CONF-921206-10) Avail: CASI HC A02/MF A01

A systematic study of iron-aluminum alloys has shown that Fe-16 at. percent Al alloys are not very sensitive to environmental embrittlement. The Fe-22 and -28 at. percent Al alloys are sensitive to environmental embrittlement, and the effect can be reduced by the addition of chromium and through the control of grain size by additions of zirconium and carbon. The Fe-16 at. percent Al binary, and alloys based on it, yielded over 20 percent room-temperature (RT) elongation even after high-temperature annealing treatments at 1100 C. The best values for the Fe-22 and -28 at. percent Al-base alloys after similar annealing treatments were 5 and 10 percent, respectively. A multicomponent alloy, FAP, based on Fe-16 at. percent Al was designed, which gave an RT ductility of over 25 percent. DOE

PHASE STABILITY AND ELECTRONIC STRUCTURE OF TRANSITION-METAL ALUMINIDES
A. E. Carlsson 1992 7 p Presented at the International Conference on the Physics of Transition Metals, Darmstadt, Germany, 20-24 Jul. 1992
(Contract DE-FG02-84ER-45130)
(DE93-003584; CONF-920762-8) Avail: CASI HC A02/MF A01

This paper will describe the interplay between the electronic structure and structural energetics in simple, complex, and quasicrystalline Al-transition metal (T) intermetallics. The first example is the Ll2-DO22 competition in Al3T compounds. Ab-initio electronic total-energy calculations reveal surprisingly large structural-energy differences, and show that the phase stability of both stoichiometric and ternary-substituted compounds correlates closely with a quasigap in the electronic density of states (DOS). Secondly, ab-initio calculations for the structural stability of the icosahedrally based Al12W structure reveal similar quasigap effects, and provide a simple physical explanation for the stability of the complex aluminide structures. Finally, parametrized tight-binding model calculations for the Al-Mn quasicrystal reveal a large spread in the local Mn DOS behavior, and support a two-site model for the quasicrystal's magnetic behavior. SPUTTER-DEPOSITION AND CHARACTERIZATION OF MOLYBDENUM DISULFIDE THIN FILMS Ph.D. Thesis

J. Obeng Sep. 1992 166 p

(Contract W-7405-eng-82)

(DE93-004801; IS-T-1597) Avail: CASI HC A08/MF A02

MoS(x) films were deposited on Si substrates by rf planar magnetron sputtering of hot-pressed MoS2 in Ar or H2S/Ar and of Mo in H2S/Ar. Results indicated that MoS(x) film properties can be controlled more easily by sputtering Mo in H2S/Ar. The surface-sensitive technique of IRRAS (infrared reflection-absorption spectroscopy) was used to study CO adsorption on MoS(x) thin films sputter-deposited on Si, Au/Si, and Pt/Si substrates. The spectra suggested mainly gas phase CO with multiple absorption bands about the 2162 and 2114 cm(sup -1) regions for CO pressures over 30 torr; no CO bands were observed for monolayer coverages. Progress was made in sputter-depositing MoS(x)/metal/Si thin films with preferred orientation. DOE

EVALUATION OF CERAMIC MATERIALS FOR AN ADVANCED STEAM-METHANE REFORMER

J. R. Keiser, J. I. Federer, J. J. Williams (Stone and Webster Engineering Corp., Boston, MA.), and R. A. Rosenberg (Stone and Webster Engineering Corp., Boston, MA.) 1993 15 p Presented at the NACE Annual Corrosion Conference and Materials Performance and Corrosion Show, New Orleans, LA, 7-12 Mar. 1993

(Contracts DE-AC05-84OR-21400; DE-FC02-88ID-12797)

(DE93-005931; CONF-930318-4) Avail: CASI HC A03/MF A01

Four ceramic materials (three silicon carbides and one silicon carbide particle-strengthened alumina composite) were corrosion tested to assess their suitability for application as tubes for a steam-methane reformer. Corrosion tests were conducted in simulated reformer atmospheres at temperatures in the range 595 to 1040 C. The fragmented, non-adherent oxide layer (cristobalite) that formed on SiC ceramics increased in thickness with increasing temperature, steam partial pressure, and exposure time. The SiC-Al2O3 composite also formed a thin reaction zone as SiC particles near the surface oxidized and then reacted with residual aluminum alloy or the alumina matrix, but, unlike the oxide layer on the SiC ceramics, the reaction zone thickness did not increase with exposure time. The strengths of the ceramic materials were measured using four-point flexure tests. Based on the limited data available, none of the materials showed a significant strength change that could be related to exposure temperature or steam partial pressure. For all four materials at 1040 C, the samples with the longest exposure time showed the lowest strength; however, this decrease was probably not statistically significant, given the limited number of samples tested. DOE

STRUCTURE, MECHANICAL PROPERTIES, AND OXIDATION BEHAVIOR OF NANOLAYERED MoSi2/SiC COATINGS

J.-P. Hirvonen (Technical Research Centre of Finland, Espoo.), H. Kattelus (Technical Research Centre of Finland, Espoo.), J. Likonen (Technical Research Centre of Finland, Espoo.), I. Suni (Technical Research Centre of Finland, Espoo.), R. Lappalainen (Helsinki Univ., Finland.), H. Kung, T. R. Jervis, and M. Nastasi 1992 14 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992

(Contract W-7405-eng-36)

(DE93-005472; LA-UR-92-4298; CONF-921101-50) Avail: CASI HC A03/MF A01

Structure, hardness, elastic properties, and oxidation of nanolayered MoSi2/SiC were examined. DC-magnetron and RF-diode sputtering were used to deposit MoSi2 and SiC, respectively. Total number of sublayers of each kind was 90. Nominal thickness of MoSi2 sublayers was 10 and that of SiC3 nm. As-deposited microstructure was amorphous whereas annealing at 500C for 1 h resulted in transformation of MoSi2 into C40 type hexagonal structure. However, silicon carbide remained still amorphous. Hardness of 11.6 and 20.8 GPa were obtained for as-deposited and annealed structure; Young moduli were 220 and 290 GPa, which yield 232 and 332 GPa for Young moduli of amorphous and crystalline MoSi2. Oxidation tests were carried out in wet conditions at 400 and 500C; degree of oxidation was determined using the reaction O(d,p)-16 O-17 at 950 keV. The MoSi2/SiC coating gave a good protection against oxidation for unalloyed steel. As compared to a single MoSi2 coating, a slightly higher degree of oxidation and a significantly different mechanism of oxidation was observed. This was also supported by secondary ion mass spectroscopy. Cracking of the coating caused by a thermal mismatch and transformation stresses was worse in the case of the single MoSi2 layer than in the case of the composite coating. Thus, cracking of the coating can be significantly reduced by using a nanolayered structure. DOE

INVESTIGATIONS OF THE EFFECTS OF ISOTOPIC SUBSTITUTION AND PRESSURE OF MISCIBILITY IN POLYMER-POLYMER AND POLYMER-SOLVENT SYSTEMS

A. VanHook 1992 6 p

(Contract DE-FG05-88ER-45374)

(DE93-005115; DOE/ER-45374/1) Avail: CASI HC A02/MF A01

Design, construction, and calibration of the polymer-solvent light scattering apparatus is complete. Preliminary results for the polystyrene-acetone system were reported; also, some theory was developed. Measurements on the polystyrene-acetone and polystyrene-methyl cyclopentane systems were completed (an abstract is included). Near tri-critical behavior is exhibited in the acetone-polystyrene system in its hypercritical point. Data on phase separation in polymer-polymer solutions by light scattering using spinodal quench techniques were obtained. Methods were worked out to synthesize perdeutero-methylcyclopentane and 1,1-dideuteropropionitrile. A review article was prepaired summarizing the field of isotopomer solution thermodynamics. DOE

SYNTHESIS AND ANALYSIS OF NOVEL POLYMERS WITH HIGH PERMSELECTIVITY AND PERMEABILITY IN GAS SEPARATION APPLICATIONS

W. J. Koros and D. R. Paul 31 Dec. 1991 14 p

(Contract DE-FG05-86ER-13507)

(DE93-005883; DOE/ER-13507/8) Avail: CASI HC A03/MF A01

Significant progress was made toward developing advanced materials for gas separation membrane applications and rationalizing molecular structure and efficacy. The following goals were accomplished: synthesized and tested polyarylates based on terephthalic or isophthalic acid or a tertiary butyl derivative of the isophthalic acid with different diols; completed high temperature characterization of sorption and transport properties for novel materials; continued studies of the phenyl-substituted polymers aimed at producing super stable high temperature useful polymers for gas

separations; and synthesized a polyarylate based on the spirobiindane diol and bibenzoyl acid chloride to incorporate long flat packable bibenzoyl units between packing disruptive spirobiindane units in an attempt to control the segmental level morphology to produce highly selective 'bottleneck' regions between highly open regions. DOE

MICROSTATIC STUDY OF THE BEHAVIOR OF GRANULAR MEDIA Ph.D. Thesis [ETUDE MICROSTATIQUE DU COMPORTEMENT DES MILIEUX GRANULAIRES]

Abdulrahman Al-Mansouri 1990 187 p In FRENCH

(ECL-90-31; ETN-93-91947) Avail: CASI HC A09/MF A02

An attempt to link microstructural phenomena and the global behavior of granular media which are considered to be continuous is presented. A bibliographical study is presented to analyze the links between experimental results and the microstructural phenomena and show what microstructural analysis can contribute to the constitutive equations. A microstatical analysis for the behavior of granular materials is proposed. The general framework of a completely microstructural approach is defined and the relationships of the microstatical approach are presented. This leads to the proposal of functions whose discretization allows the internal state of these materials to be described by a limited number of parameters. An expression of the global behavior criterion is proposed. The yielding surfaces and failure surface are presented. A global constitutive model for granular materials based on microstructural considerations is proposed. The numerical results obtained are in good agreement with experimental results and prove the advantage of this kind of analysis. ESA

STRUCTURE, STOICHIOMETRY AND STABILITY IN MAGNETOPLUMBITE AND (BETA)-ALUMINA TYPE CERAMICS

A. N. Cormack and J. G. Park Dec. 1992 5 p

(Contract DE-FG02-91ER-45451)

(DE93-007303; DOE/ER-45451/2) Avail: CASI HC A01/MF A01

Work has continued on the computer simulation of atomic scale defect complexes in polyaluminates with the magnetoplumbate and beta-alumina structures. More stringent criteria have been developed for determining the viability of interatomic potential models for these complex structured materials, details of the cation coordination having been found to be important. It appears that the energetics of point defect complex formation is the reason why Ba hexa-aluminate does not adopt the magnetoplumbate structure, in contrast to Sr hexa-aluminate, which does. DOE

A SUMMARY OF LABORATORY TESTING PERFORMED TO CHARACTERIZE AND SELECT AN ELASTOMERIC O-RING MATERIAL TO BE USED IN THE REDESIGNED SOLID ROCKET MOTORS OF THE SPACE TRANSPORTATION SYSTEM

J. E. Turner Feb. 1993 38 p

(NASA-TM-108395; NAS 1.15:108395) Avail: CASI HC A03/MF A01

An elastomeric O-ring material is used in the joints of the redesigned solid motors (RSRM's) of the National Space Transportation System (NSTS). The selection of the O-ring material used in the RSRM's was a very thorough process that included efforts by NASA's Marshall Space Flight Center and the Langley Research Center, and the Thiokol Corporation. One of the efforts performed at MSFC was an extensive in-house laboratory test regime to screen potential O-ring materials and ultimately to characterize the elastomeric material that was chosen to be used in the RSRM's. The laboratory tests performed at MSFC are summarized. Author

INTERFACIAL CHEMISTRY OF A PERFLUOROPOLYETHER LUBRICANT STUDIED BY XPS AND TDS

Pilar C. Herrera-Fierro, William R. Jones, Jr., and Stephen V. Pepper Apr. 1992 39 p

(RTOP 505-63-5A)

(NASA-TM-106014; E-6889-1; NAS 1.15:106014) Avail: CASI HC A03/MF A01

The interfacial chemistry of Fomblin Z25, a commercial perfluoropolyether used as lubricant for space applications, with different metallic surfaces: 440C steel, gold and aluminum was studied. Thin layers of Fomblin Z25 were evaporated onto the oxide-free substrates and the interfacial chemistry studied using XPS and TDS. The reactions were induced by heating the substrate and by rubbing the substrate with a steel ball. Gold was found to be completely unreactive towards Fomblin at any temperature. Reaction at room temperature was observed only in the case of the aluminum substrate, the most reactive towards Fomblin Z25 of the substrates studied. It was necessary to heat the 440C steel substrate to 190 degree C to induce decomposition of the fluid. The degradation of the fluid was indicated by the formation of a debris layer at the interface. This debris layer, composed of inorganic and organic reaction products, when completely formed, passivated the surface from further attack to the Fromblin on top. The tribologically induced reactions on 440C steel formed a debris layer of similar chemical characteristics to the thermally induced layer. In all cases, the degradation reaction resulted in preferential consumption of the difluoroformyl carbon (-OCF2O-). Author (revised)

DEVELOPMENT OF AN INTERFACIAL TEST SYSTEM FOR THE DETERMINATION OF INTERFACIAL PROPERTIES IN FIBER REINFORCED CERAMIC COMPOSITES

A. A. Wereszczak, M. K. Ferber, and R. A. Lowden 1993 15 p Presented at the 17th Annual Conference on Composites and Advanced Ceramics, Cocoa Beach, FL, 11-15 Jan. 1993

(Contract DE-AC05-84OR-21400)

(DE93-006743; CONF-930164-5) Avail: CASI HC A03/MF A01

In fiber-reinforced ceramic composites, a critical need exists for the accurate measurement of interfacial properties such as the debond strength, sliding shear stress, and residual stress. The characterization of these properties frequently relies on the use of indentation techniques and their instrumentation which may suffer from one or more of the following: insufficient load capabilities, lack of automation, the indentor used produces plastic deformation or worse fiber fracture, and/or inability to conduct tests on fibers whose diameter may be as small as 10-12 micron. The development of an interfacial test system at ORNL represents a concerted effort at addressing these limitations. A description of the hardware and a brief test methodology is presented in addition to a discussion of two test cases. DOE

FACTORS INFLUENCING THE THERMAL SHOCK BEHAVIOR OF CERAMICS

P. F. Becher and W. H. Warwick 1992 12 p Presented at the International Conference of Thermal Shock and Thermal Fatigue Behavior of Advanced Ceramics, Schloss-Ringberg, Germany, 9-13 Nov. 1992

(Contract DE-AC05-84OR-21400)

(DE93-005762; CONF-9211157-2) Avail: CASI HC A03/MF A01

Application of ceramics requires resistance to tensile stresses from steep thermal gradients. Among popular test techniques to evaluate thermal stress/shock resistance is the down-quench test where the strength retained is determined after quenching. When the temperature difference is sufficient to cause loss in strength, this temperature difference represents the critical temperature drop, Delta-Tc. The thermal shock resistance becomes greater as Delta-Tc increases. However, heat conduction within the sample during quenching results in temperature (and surface tensile stresses) gradients that are less in thin samples as compared to thick samples. In fact, the Delta-Tc values for a given material will decrease and then reach or approach a constant value with increase in sample thickness. Increases in fracture toughness and thermal conductivity yield significant increases in Delta-Tc values in SiC whisker-reinforced alumina versus unreinforced alumina. Changes in the thermal shock damage from large cracks in alumina to a high density of microcracks in zirconia toughened alumina composites are indicated as one source of their improved thermal shock resistance. STRENGTH OPTIMIZATION THROUGH POWDER MODIFICATION
A. E. Pasto, F. Avella (GTE Labs., Inc., Waltham, MA.), S. Natansohn (GTE Labs., Inc., Waltham, MA.), and W. J. Rourke (Duracell, Inc., Needham, MA.) 1992 9 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-005109; CONF-921101-16) Avail: CASI HC A02/MF A01

Effect of oxygen content of silicon nitride powders on properties of resulting ceramics was studied by physically and chemically treating the powder to modify its surface oxygen content. These powders were hot-pressed into dense ceramics. Strength and oxidation resistance of these ceramics were measured and correlated with the powder and ceramics compositions as well as the resulting intergranular phases. Results showed that the phases developed in yttria-containing silicon nitride ceramics varied with slight changes in the initial powder oxygen content, as predicted, and that strength could be correlated to initial oxygen concentration. Best results were obtained when the oxygen content was increased by thermal oxidation. A Taguchi Methods experimental study designed to optimize the thermal treatment resulted in silicon nitride ceramics with strength improvements of 22 and 37 percent at ambient temperature and 1370 C, respectively, as compared to untreated powders. Oxidation resistance was also improved. DOE

COMPATIBILITY OF REFRIGERANTS AND LUBRICANTS WITH ELASTOMERS
G. R. Hamed and R. H. Seiple Jan. 1993 290 p
(Contract DE-FG02-91CE-23810)
(DE93-007808; DOE/CE-23810/8D) Avail: CASI HC A13/MF A03

The information contained in this report is designed to assist the air-conditioning and refrigeration industry in the selection of suitable elastomeric gasket and seal materials that will prove useful in various refrigerant and refrigeration lubricant environments. 97 percent of the swell measurements have been made to date. The other 3 percent of the measurements are contingent on availability of additional R-32. Swell behavior in the fluids have been determined using weight and in situ diameter measurements for the refrigerants and weight, diameter and thickness measurements for the lubricants. Weight and diameter measurements are repeated after 2 and 24 hours for samples removed from the refrigerant test fluids and 24 hours after removal from the lubricants. DOE

PRESSURE-INDUCED AMORPHIZATIONS OF SILICA ANALOGUES: A PROBE OF THE RELATIONSHIP BETWEEN ORDER AND DISORDER
W. S. Hammack Feb. 1993 4 p
(Contract DE-FG02-92ER-45474)
(DE93-007966; DOE/ER-45474/1) Avail: CASI HC A01/MF A01

The purpose of these high pressure investigations is to determine the relationship between order and disorder in amorphous materials using high pressure techniques. Cornell High Energy Synchrotron Source (CHESS) at Ithaca was used to measure x-ray diffraction patterns using Energy-Dispersive X-ray Diffraction. It was shown that the structural ordering in pressure-amorphized solids can be described as defects in curved-space. High-resolution transmissions electron microscopy showed that pressure-amorphized alpha-quartz lacks periodicity at the atomic level. Study of a silicate mineral shows that pressure-induced amorphizations occur because of an impeded phase transition. DOE

COMPATIBILITY OF REFRIGERANTS AND LUBRICANTS WITH MOTOR MATERIALS
R. Doerr and S. Kujak Oct. 1992 29 p
(Contract DE-FG02-91CE-23810)
(DE93-006428; DOE/CE-23810/4B) Avail: CASI HC A03/MF A01

During the compatibility study of 10 pure refrigerants with 24 motor materials, it was observed that the greatest damage to the insulation system was caused by absorption of refrigerant followed by rapid desorption. The observed effects were blisters, cracking, internal bubbles and delamination. Measured results include decreased bond strength, dielectric strength and overall integrity of the material. Refrigerants HCFC-22, HFC-32, HFC-134 and HFC-152a exhibited this phenomena. The effect of HCFC-22 was most severe of the tested refrigerants. Since HCFC-22 has an excellent reliability history with many of the materials tested, compatibility with the new refrigerants is expected. DOE

TESTS OF HERCULES/ULTRAMET CVD COATINGS IN HOT HYDROGEN
P. E. Vanier, R. E. Barletta, J. Svandrlik, and J. Adams 1992 12 p
(Contract DE-AC02-76CH-00016)
(DE93-005533; BNL-47965) Avail: CASI HC A03/MF A01

The effort by Hercules and Ultramet to produce CVD NbC coatings, which protect carbon-carbon substrates from hot hydrogen, has had some success but with some limitations. The coatings increase the survival time at atmospheric pressure and low flow rate of hydrogen by about a factor of 40 over uncoated graphite at 3000 K. However, the grain structure is not stable at these temperatures, and after about 10-20 minutes, the coating is subject to rapid degradation by spalling in visible chunks. Further experiments would have to be performed to determine the effects of higher pressures and flow rates, for it is not clear how these factors would affect the survival time, considering that one of the main failure mechanisms is independent of the atmosphere. Major results along with publications are presented. Some results noted include preparation and study of a low band-gap transparent conducting polymer, poly(1,4-bis(2-heteroaryl) p-phenylenes), electroactive transition metal containing polymers, and conducting polymer composites. In addition, many studies dealing with ion transport upon redox switching of these electroactive polymers were carried out and new probes to monitor these ion fluxes were developed. A highly efficient polypyrrole platinum nano-composite, with useful catalytic properties was also developed. Accurate theoretical and computational techniques, along with a modified Extended Huckel band structure procedure, were developed. GRA

Electron paramagnetic resonance (EPR), photo-thermal deflection spectroscopy (PDS), and electrical measurements were used to characterize as-received and UV-lluminated lead lanthanum zirconate titanate (PLZT) and PZT ceramics. Following optical illumination we observe the activation of positively charged Pb(+3) and negatively charged Ti(+3) ions, as well as an increased broad absorption peak around 2.6 eV. The spatial distribution of the induced absorption correlates well with the location of the absorbed UV, suggesting that photo-produced carrier pairs are trapped at Ti(+4) and Pb(+2) producing the observed paramagnetism. The Ti(+3) EPR spectra were successfully fit using the crystal field parameters derived from the PDS spectra. Preliminary results suggest that these charged paramagnetic ions can influence the electrical properties of PZT thin films. We investigated the effects of UV light and dc bias sequences by polarization-electric field (PE) measurements and find that the coercive fields are dependent on the sign of the applied bias during UV exposure. It is reasonable to expect that Pb(+3) and/or Ti(+3) ions act as the charge trapping sites which cause the threshold voltage shifts in the PE loop. DOE

ELECTRICAL CHARACTERIZATION OF CONDUCTING POLYMERS AND POLYMERIC SEMICONDUCTOR DEVICES Ph.D. Thesis
Eero Punkka Helsinki, Finland Finnish Academy of Technology 1991 34 p Sponsored by Academy of Finland, Technical Research Centre of Finland, Tekniikan Edistaetaemissaeaetioe, Neste Oy, A. Kordelin Foundation, and O. Oeflund Foundation
(Acta-Pol-Scand-Ph-178; ISBN-951-666-342-7; ETN-93-93475) Avail: CASI HC A03/MF A01

Electrically conducting polymers were characterized by transport measurements and by utilizing polymeric semiconductor devices. The temperature and electric field dependences of the conductivity indicate that the transport mechanism changes from variable range hopping between localized states in undoped poly(3-alkylthiophenes) to charging energy limited tunneling between highly conducting islands in the doped polymer. The experiments yield detailed quantitative information on the electrical conduction processes and the structural homogeneity of the poly(3-alkylthiophenes) processed to free standing films, polymer blends, spin cast films, and Langmuir-Blodgett films. Field effect transistors, Schottky diodes, and metal insulator semiconductor structures were also fabricated using thin films of poly(3-alkylthiophene) and polypyrrole as active semiconductive components. Important parameters, such as the charge carrier mobility, dopant concentration, and the height and width of a rectifying barrier are extracted from the device characteristics. The device configurations are further utilized in the dopant profiling of novel molecular heterostructures. ESA

FRACTOGRAPHY APPLIED TO POLYMERIC MATERIALS. PART 9: CREEP AND RUPTURE ANALYSIS
P. Chan and A. B. Mitchell Oct. 1991 70 p
(Contracts DSS-W770700893; DSS-OSC-90-00047-(009))
(DREA-CR-91-470; CTN-93-60699) Avail: CASI HC A04/MF A01

Selected mathematical functions were applied to creep data previously obtained at 25 C for polymethyl methacrylate (PMMA), polyvinyl chloride (PVC), and polyethylene (PE), and their applicability was assessed. Nonlinear regression analysis was used to demonstrate that polynomial and parabolic functions gave the best overall fit for modelling PMMA creep behavior, parabolic and exponential functions for PVC creep behavior, and parabolic and polynomial logarithmic functions for PE creep behavior. The time-stress superposition principle was used to construct master curves for the secondary creep of all three polymers. Log-log relationships between initial stress and master curve shift factor were established to facilitate extrapolation of the master curves to other stress levels. Linear relationships for semi-log and log-log plots of stress versus time to rupture and time to initiation of tertiary creep were demonstrated for PMMA and PVC. These polymers differed from PE, for which a linear relationship between stress and time to rupture (or time to initiation of tertiary creep) appeared to hold. Author (CISTI)

DEVELOPMENT OF FIRE PROTECTIVE COATINGS FOR GRP COMPOSITES USING PLASMA DEPOSITION TECHNOLOGY, PHASE 2 Final Report
S. Johar Jul. 1991 70 p
(Contract DSS-W7707-9-1164)
(DREA-CR-91-453) Avail: CASI HC A04/MF A01

Plasma spray technology was developed for applying ceramic based coatings (alumina and zirconia) onto glass reinforced polymeric materials (GRP's). The effect of surface preparation on the adhesion of the coating was examined, and the failure of coating adhesion was evaluated qualitatively. Surface preparation by grit blasting as normally used for plasma spraying of metal and ceramic substrates was found to be unsuitable for obtaining adherent coatings on GRP's. Chemical etching just prior to grit blasting at moderate to low pressure was found to give the desired results. The failure of coating bonding initiated either from glass fiber/coating interface or due to the presence of significant carbon buildup. The adhesive strength of the coating decreases with increasing thickness, most probably due to buildup of thermal stresses in the coating. Phenolic based GRP's were found to be most suitable for developing plasma sprayed coating. The fire protective properties of the coatings were also studied; in most cases the coated materials showed significant improvement in fire protection. Author

NEW METHODS AND INSTRUMENTATION FOR THE CHARACTERIZATION OF BIOPOLYMERS USING ELECTROSPRAY IONIZATION-MASS SPECTROMETRY
R. D. Smith, H. R. Udseth, A. L. Rockwood, B. E. Winger, S. A. Hofstadler, D. R. Goodlett, and K. J. Light-Wahl Sep. 1992 3 p Presented at the Mass Spectrometry Society of Japan, Japanese Society for Biomedical Mass Spectrometry Conference, Osaka, Japan, 20-24 Sep. 1992
(Contract DE-AC06-76RL-01830)
(DE93-005100; PNL-SA-20758; CONF-9209283-1) Avail: CASI HC A01/MF A01

The technique of electrospray ionization (ESI) has significantly extended the ability to characterize large molecules by mass spectrometry. Proteins to at least 200,000 D can be transferred intact to the gas phase and molecular weights determined with precisions as high as 0.001 percent if individual charge states can be resolved. The ESI-MS can also serve as a near ideal interface and detector for capillary column separations providing a basis for highly efficient sample utilization. Using capillary electrophoresis (CE)-MS, injection quantities in the 10(sup -18) mole range can be detected for smaller polypeptides using selected ion monitoring, and separation efficiencies as high as 5 x 10(exp 5) theoretical plates have been realized. We have recently shown that the use of small 5 micrometer i.d. capillaries allows CE-MS with scanning detection for proteins for injection of 600 attomoles. DOE

SPUTTER ION PLATING ON Ti6AlV4 AND Ti(cp): PREPARATION AND PROPERTIES OF OXIDATION AND WEAR RESISTANT COATINGS
Meinhard Meyer, Richard Suchentrunk, Horst E. Franz, B. Mathes (Technische Univ., Darmstadt, Germany.), and E. Broszeit (Technische Univ., Darmstadt, Germany.) 1992 10 p Presented at 7th World Conference in Titanium (TMS), San Diego, CA, 28 Jun. - 2 Jul. 1992 Sponsored by BMFT
(MBB-Z-0444-92-PUB; ETN-93-93445) Avail: CASI HC A02/MF A01

The application of sputter ion plating as a versatile deposition technique is described. Coatings deposited in such a way help avoid surface embrittlement and crack initiation as a consequence of oxygen penetration and dissolution. Titanium Ti6Al4V and Ti(cp), were coated with Al, Ni, NiCR, Cr and Cr2N. Nickel and aluminum form titanium intermetallics rapidly, while chromium and Cr2N do not. Crack propagation during 3 point bending tests was observed in differently coated Ti6AlAV in the scanning electron microscope. The results which give information on the mechanical behavior of the thin layers are provided. The wear tests in a plate-on-cylinder tribometer show a large decrease of wear if the titanium plates were coated by a PVD/galvanic deposition. ESA

DIELECTRIC AND DYNAMIC MECHANICAL PROPERTIES OF ATBN-CONTAINING THERMOSETS
G. P. Johari Aug. 1991 98 p
(Contract DSS-W7707-0-1026/01-OSC)
(DREA-CR-91-444; CTN-93-60662) Avail: CASI HC A05/MF A02

Five epoxy-based thermoset composites containing up to 61.4 percent by weight of amine terminated butadiene acrylonitrile (ATBN) elastomer were prepared by prescribed thermal treatments. The thermoset consisted of a rigid matrix of diglicydyl ether of bisphenol-A which was cured with Versamid 125 or Ancamide 260A. Curing kinetics of samples of each of the ATBN/epoxy blends were monitored using dielectric measurements for a fixed frequency of 1 kHz. The dielectric properties of the cured samples were measured over the 77-350 K temperature range. The data obtained from this and an earlier study were interpreted and discussed with reference to the literature. A detailed dielectric study of pure ATBN, pure thermoset and ATBN-containing thermosets during their sol to gel glass transformation and phase separation in the sol states shows time dependent changes that can be understood in terms of the direct current conductivity, orientation polarization, and liquid-liquid phase separation. The sub-transition temperature dynamic mechanical relaxation of ATBN-containing thermosets is mainly due to the glass-rubber or alpha relaxation process of the ATBN, whose peak appears at a temperature and frequency near the gamma relaxation peak of the pure thermoset. The rate of curing becomes slower with increased amount of ATBN in the thermoset. Author (CISTI)

The database provides bibliographic citations and abstracts for publications that may be useful in research and design of air-conditioning and refrigeration equipment. The database identifies sources of specific information on R-32, R-123, R-124, R-125, R-134, R-134a, R-141b, R-142b, R-143a, R-152a, R-245ca, R-290 (propane), R-717 (ammonia), ethers, and others as well as azeotropic and zeotropic and zeotropic blends of these fluids. It addresses lubricants including alkylbenzene, polyalkylene glycol, ester, and other synthetics as well as mineral oils. It also references documents on compatibility of refrigerants and lubricants with metals, plastics, elastomers, motor insulation, and other materials used in refrigerant circuits. A computerized version is available that includes retrieval software. DOE

A GEL-PERMEATION CHROMATOGRAPHY STUDY OF ELECTROCHEMICALLY SYNTHESIZED POLY(3-ALKYLTHIOPHENES) Technical Report, 31 May 1991 - 30 Jun. 1992
Y. Wei and J. Tian 26 Jun. 1992 14 p
(Contract N00014-90-J-1559)
(AD-A259864; TR-1992-38) Avail: CASI HC A03/MF A01

Poly(3-n-pentylthiophene) and poly(3-n-hexylthiophene) were prepared using potentiostatic method and were characterized by gel-permeation chromatography (g.p.c.) in THF. In general, the molecular weight of the polymers increased as the applied potential was increased in the range of 1.3 to 1.7 V vs. SCE. The presence of 2,2'-bithiophene in the polymerization system resulted in a slight decrease in molecular weight but the polymer chains having higher regularity as evidenced by longer pi-conjugation length. At the potentials greater than 1.9 V, the molecular weight decreased because of polymer degradation. The results strongly support the electrophilic aromatic substitution mechanism for electrochemical polymerization of thiophene monomers. GRA

THERMALLY INDUCED MICROMECHANICAL STRESSES IN CERAMIC/CERAMIC COMPOSITES
Zhuang Li and R. C. Bradt (Nevada Univ., Reno.) Nov. 1992 14 p Presented at the International Conference of Thermal Shock and Thermal Fatigue Behavior of Advanced Ceramics, Schloss-Ringberg, Germany, 9-13 Nov. 1992

(Contract W-31-109-eng-38)
(DE93-004860; ANL/MSD/CP-78152; CONF-9211157-1) Avail: CASI HC A03/MF A01

The internal micromechanical stresses which develop in ceramic-ceramic composites as a consequence of temperature changes and thermoelastic property differences between the reinforcing and matrix phases are addressed by the Eshelby method. Results for two whisker reinforced ceramic matrix composites and for quartz particles in porcelain are discussed. It is concluded that the stresses which develop in the second phase reinforcing inclusions are quite substantial (GPa-levels) and may be highly anisotropic in character. These stresses are additive to the macroscopic thermal stresses from temperature gradients which are encountered during heating and cooling, and also to externally applied mechanical stresses (loads). These micromechanical stresses are expected to be highly significant for thermal cycling fatigue and other failure processes. DOE

BOUNDARY FILM FOR STRUCTURAL CERAMIC MATERIALS
O. O. Ajayi, A. Erdemir, J. H. Hsieh, R. A. Erck, G. R. Fenske, and F. A. Nichols May 1992 22 p Presented at the 9th International Conference of Wear of Materials, San Francisco, CA, 13-17 Apr. 1993
(Contract W-31-109-eng-38)
(DE93-004871; ANL/CP-75342; CONF-930414-3) Avail: CASI HC A03/MF A01

Structural ceramic materials, like metals, will require lubrication if they are to be used extensively for tribological applications. The use of thin soft metallic coatings (specifically Ag) as a boundary film during mineral oil lubrication of silicon nitride (Si3N4) and zirconia (ZrO2) ceramic materials was investigated in this study. With a pin-on-flat contact configuration in reciprocating sliding, the steady friction coefficient was reduced by a factor of 2 (0.14-0.16 vs. 0.06-0.07) when the flats were coated with Ag. Also, with Ag coatings the wear of pins was reduced to an unmeasurable level, whereas, in the absence of Ag coatings specific wear rates of approx 2 x 10(sup -9) - 4 x 10(sup -8) mm(sup 3)/Nm and approx 7 x 10(sup -8) - 2 x 10(sup -7) mm(sup 3)/Nm were measured for Si3N4 and ZrO2 pins respectively. In addition to preventing direct contact between pins and flats, thereby reducing wear, the Ag coatings also act as a solid lubricant, help dissipate flash heating, and accelerate modification of the (lambda) ratio. TEXTURED COATINGS FROM COLLOIDAL SUSPENSIONS OF FACETED OXIDE MICROCRYSTALS
G. W. Steadman, J. R. Brewster, J. D. Budai, and L. A. Boatner 1992 7 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-006601; CONF-921101-80) Avail: CASI HC A02/MF A01

The morphological properties of cubic, faceted MgO microcrystals have been exploited in the formation of textured coatings. Coatings exhibiting a (100) 'fiber' texture were formed by centrifugal sedimentation of colloidal suspensions onto a flat substrate. A decrease in the degree of preferred orientation in the coatings with increasing areal coverage of the particles was quantified for several particle-size distributions by using x-ray diffraction. Novel methods for the deposition of particles exhibiting an in-plane preferred orientation in addition to fiber texture have been investigated. DOE

STUDY OF THE ALPHA AND BETA MECHANICAL RELAXATIONS OF PMMA, PS AND THEIR COPOLYMERS Ph.D. Thesis [ETUDE DES RELAXATIONS MECANIQUES ALPHA ET BETA DU PMMA, DU PS ET DE LEURS COPOLYMERS]
Elisabeth Muzeau 1992 223 p In FRENCH
(ISAL-92-0042; ETN-93-93684) Avail: CASI HC A10/MF A03

A study on alpha and beta mechanical relaxations of the amorphous polymers PMMA (Polymethylmethacrylate), PS (Polystyrene), and their copolymers, by low frequency mechanical dynamical spectrometry, which aimed at understanding the relationship between the mechanical properties and the chemical structure of the systems, is presented. PMMA beta relaxation analysis attributed the characteristic time distribution to a very wide distribution of the entropy factor as well as a narrower distribution of the energy factor. Beta relaxation of the copolymers showed two components: the first relates to the MMA units relaxation and its temperature characteristics vary with the composition of the copolymer, while the second is identified with PS beta relaxation. Alpha relaxation of the copolymers showed a single principle relaxation with characteristics somewhere between those of PMMA and PS. PMMA alpha relaxation extends to temperatures as low as the beta field. The alpha relaxation of all the materials was analyzed with the help of a molecular theory. The isothermal physical aging of these systems was studied at temperatures as low as 90C Tg. The physical aging effects on mechanical relaxations showed that only alpha relaxation is affected by this phenomena. Thus it was possible to explain alpha relaxation modifications using the molecular theory. ESA

ELECTRON DIFFUSION COEFFICIENTS IN HYDROGELS FORMED OF CROSS-LINKED REDOX POLYMERS Technical Report, Oct. 1992 - Jan. 1993
Atsushi Aoki and Adam Heller 26 Jan. 1993 22 p Sponsored in part by NIH and the Welch Foundation
(AD-A260163; TR-002) Avail: CASI HC A03/MF A01

The electron diffusion coefficient (D(sub e)) for the redox polymer POs-EA, an ethylamine quaternized poly(vinylpyridine) complex of Os(bipyridine)2Cl2, was directly measured by steady-state voltammetry at interdigitated array (IDA) electrodes. In cross-linked POs-EA D(sub e) decreased upon increasing the ionic strength and upon changing the hydrophilic chloride counterion to the hydrophobic perchlorate anion. In 5.0 wt percent cross-linked POs-EA, D(sub e) is pH dependent increasing from 4.5 x 10(exp -9) to 1.6 x 10(exp -8) cm(sup 2)/sec as the pyridine rings are protonated. In highly (25 wt percent) cross-linked POs-EA, the motion of the chains is restricted, D(sub e) is independent of pH. The results show that D (sub e) increases steeply upon hydration of POs-EA. It is proposed that the extent of electron diffusion in redox hydrogel is determined by segmental motion of the polymer backbone and is therefore enhanced, rather than diminished upon swelling of the redox polymer network, that increases the static distances between redox centers. GRA

PROCESSABLE PRECURSORS TO HIGH PERFORMANCE LIQUID CRYSTALLINE POLYMERS Final Report, 1990 - 1992
I. I. Harruna Oct. 1992 5 p
(Contract DAAL03-90-G-0190)
(AD-A260466; ARO-28093.2-CH-SAH) Avail: CASI HC A01/MF A01

Processable precursor polymers to aramids, poly(imino 1,4-phenyleneiminocarbonyl-1,4 phenylenecarbonyl) and poly(imino 1,3-phenyleneiminocarbonyl 1,4-phynelenecarbonyl), were prepared and studied. The precursor polymers were made from the reaction of 2,5-dichlorobicyclo (2.2.2)octane 1,4-dicarbonyl chloride or 2,5-diacetoxybicyclo (2.2.2)octane-1,4-dicarboxylic acid. The polymeric precursors were subsequently converted in approximately 98 percent - 100 percent yields, via dehydrohalogenation and retro Diels-Alder reactions to the corresponding aramids by refluxing in 1M solution of potassium hydroxide or sodium hydroxide, or by bulk pyrolysis using aromatization catalysts, such as, ZnCl2 and dichlorobenzene sulfonic acid. Only the p-phenylene precursor polymer exhibited liquid crystal characteristics in solution. Thermal properties were examined and tensile properties will be determined in a future study. GRA

BASIC RESEARCH ON MACROMOLECULAR DYNAMICS Annual Report, 1 Sep. 1991 - 31 Aug. 1992
J. H. Weiner Sep. 1992 45 p Sponsored by Gas Research Inst., Chicago, IL
(Contract GRI-5091-260-2237)
(PB93-138907; GRI-92/0442) Avail: CASI HC A03/MF A01

Work in this past year has focused on the computer simulation of the viscoelastic behavior of dense polymer melts with the goal of clarifying the role of the excluded volume (EV) interactions in the production of stress. The widely-held classical viewpoint is that EV makes only an isotropic contribution to the stress and that the anisotropic part of the stress is transmitted through the covalently-bound chains acting as entropic springs. By contrast, our simulations show that EV interactions are primarily

responsible for the anisotropic stress throughout the relaxation process. Initial simulations were performed using idealized chain models. This past year simulations were performed with chain models of increasing realism. The basic conclusion concerning the unexpected role of EV remained unchanged. GRA

ELECTRON CONDUCTING ADDUCTS OF WATER-SOLUBLE REDOX POLYELECTROLYTES AND ENZYMES Technical Report No. 1, Oct. 1992 - Jan. 1993
Ioanis Katakis, Mark Vreeke, Ling Ye, Atsushi Aoki, and Adam Heller 26 Jan. 1993 39 p LIMITED REPRODUCIBILITY: Availability: Document partially illegible
(AD-A259938) Avail: CASI HC A03/MF A01

Biochemical fluxes were transduced to electrical currents through catalytic centers of oxidoreductases, that were electrically connected to electrodes with crosslinked hydrogel forming redox polymers. The enzymes were covalently bound to the hydrogels through which the electrons diffuse. The electron diffusion coefficients, reaching 10(exp -8) cm(exp 2)sec(exp -1) in the redox polymer gels, were high enough to allow efficient collection of the electrons transferred during the electrooxidation or electroreduction of substrates. The adequate electron diffusion through the polymer skeleton of the hydrogel and the rapid diffusion of water-soluble substrates and products in the gels led to high current density enzyme electrodes. These included electrodes with electrically connected flavoenzymes (e.g. sarcosine, glutamate, lactate and glucose oxidases), quinoprotein enzymes (e.g. PQQ glucose dehydrogenase) and heme enzymes (e.g. peroxidases). The peroxidase electrodes are useful in the sensing of NAD(P)H, that catalytically reacts with oxygen in the presence of N-methyl phenazonium salts to form NAD(P)+ and H2O2. GRA

THE STUDY OF POLYETHER SOLVATION MECHANISMS USING UV/VISIBLE SPECTROSCOPY Technical Report, 31 May 1991 - 30 Jun. 1992
M. Mendolia, H. Cai, and G. C. Farrington 12 Jun. 1992 53 p
(Contract N00014-90-J-1559)
(AD-A260355; Rept-1992-26) Avail: CASI HC A04/MF A01

It is demonstrated that UV/Visible spectroscopy is a very useful technique for learning about the coordination of certain transition metal ions in polymer electrolytes. The results demonstrate unequivocally that complex ions exist in polymer electrolytes of this sort, particularly at moderate to high salt concentrations and at elevated temperatures. Furthermore, it appears that free anions and anionic complex species are the predominant charge carriers in the electrolytes studied. In fact, the studies indicate that the principal mechanism of cation mobility in Co(II) and Ni(II)-PEG electrolytes is by the motion of complex anions, not the diffusion of uncomplexed cations. GRA

ULTRAFAST FREQUENCY AGILE OPTICAL MATERIALS: ORGANICALLY DOPED SOL-GEL GLASSES Final Report
Eric L. Chronister 14 Oct. 1992 19 p
(Contract DAAL03-89-G-0095)
(AD-A260525; ARO-27185.5-MS-SM) Avail: CASI HC A03/MF A01

This report focuses on organically doped sol-gel glasses as novel fast response photochromic materials. In particular, we discuss time-resolved spectroscopic measurements of the following: (1) nanosecond optical energy transfer in organically doped glasses; (2) investigation of the spatial distribution of chromophores within the porous sol-gel matrix; (3) homogeneous dephasing of optically excited states as a probe of chromophore-host interactions; (4) time-resolved anisotropy measurements as a probe of chromophore dynamics in porous sol-gel matrices; and (5) optical limiting based on fast photophysical processes of organic chromophores. Optical energy transfer in organically doped sol-gel glasses is investigated by time-resolved fluorescence depolarization measurements. We observe nanosecond optical energy transfer and analyze these results in terms of the spatial distribution of chromophores in doped porous xerogel glasses. Time-resolved polarized emission results are also used to probe the rotational dynamics of chromophores during the fabrication process from solution to gel to porous glass. Furthermore, picosecond photon echo measurements have been used to obtain the homogeneous dephasing rate of organic dopants in an inorganic sol-gel glass, as a means of probing chromophore-host environment. METHOD FOR BONDING A POLYURETHANE MOLDING COMPOSITION TO A CABLE JACKET OF AN OLEFIN/ESTER INTERPOLYMER Patent Application
Thomas S. Ramotowski, inventor (to Navy) 23 Sep. 1992 19 p
(AD-D015627; US-Patent-Appl-SN-948561; Navy-Case-73940) Avail: CASI HC A03/MF A01

A room temperature curing polyurethane composition is bonded to the surface of cables having jackets of an olefin/ester interpolymer to provide a water resistant seal thereabout by first exposing the surface of a length of cable to an alkali metal hydroxide solution to hydrolyze the functional ester groups and thereby substitute hydroxyl groups for the organic acid of the ester in the interpolymer at the surface of the jacket. A diisocyanate primer is applied to the treated surface and it interacts with the hydroxyl groups to produce pendant reactive groups. A room temperature curing urethane prepolymer composition is then molded about the primed surface at ambient temperatures and the unreacted hydroxyl groups along the urethane prepolymer chain react with the pendant reactive groups of the jacket to produce a firmly bonded overmolding on the jacket. PERFORMANCE STUDY OF THE RHEOMETRICS MELT FLOW MONITOR FOR REAL-TIME RHEOLOGICAL CHARACTERIZATION [ETUDE DE LA PERFORMANCE DU MELT FLOW MONITOR (RHEOMETRICS) POUR CARACTERISATION RHEOLOGIQUE EN TEMPS REEL]
Karim Amellal Mar. 1992 165 p In FRENCH; In ENGLISH and FRENCH
(NRC-34372; IMI92RT-32200-1369-G; CTN-93-60708) Avail: CASI HC A08/MF A02

The Rheometrics Melt Flow Monitor (MFM) is designed to be mounted between the output of a polymer extruder and the die by means of an adapter. In operation, a small quantity of melted polymer is deviated from the main flow leaving the extruder and fed in a controlled, pressure isolated manner through the monitor by means of independently operating inlet and outlet pumps. The two pumps control the flowrate of melted polymer through an opening in the MFM while temperature and pressure sensors control the flow conditions of the melted polymer. The MFM is intended to measure the real-time viscosity of melted polymer during the extrusion process, as well as other rheological characteristics. Tests were conducted on polypropylene 6631 to verify the validity of the data treatment performed in the MFM and the reproducibility of results, to evaluate the precision of the results, to study certain aspects of MFM operation, and to evaluate the effectiveness of the MFM in terms of control of extrusion parameters. The MFM was found capable of generating reproducible and reliable results. Shear stress sweeping at 30-second delay was found to offer a better precision in rheological results than a shear rate sweep at 100 second delay, but at a longer test duration. The method of determination of activation energy from MFM data was also found very reliable. CISTI

SOLID-STATE (31)P MAGIC ANGLE SPINNING (MAS) NMR STUDY OF THE PARTITIONING AND REACTION OF ORGANOPHOSPHORUS ESTERS ADSORBED ON SYNTHETIC RESIN CATALYSTS Final Report, Feb. - Aug. 1991
William T. Beaudry, George W. Wagner, and J. R. Ward Sep. 1992 22 p
(DA Proj. 101-61102-A-71-A)
(AD-A259889; CRDEC-TR-419) Avail: CASI HC A03/MF A01

A powder containing sorptive and reactive resins that was developed for the removal and subsequent catalytic degradation of toxic organophosphorus esters is characterized using dimethyl methylphosphonate (DMMP), p-nitrophenyl diphenyl phosphate (PNDP), and P-31 MAS NMR. The results for DMMP confirm, spectroscopically, that adsorbed ester partitions between the sorptive and reactive resin components. Spectra of the DMMP surface probe adsorbed on the resin are indicative of two different adsorption sites, one possessing a much larger capacity compared to the other. The large capacity site in assigned to the reactive resins, and the smaller capacity site is assigned to the sorptive carbonaceous resin. Variable temperature P-31 MAS NMR results for DMMP demonstrate that any molecular exchange between these sites must be occurring at a rate less than 300/s, even at 50 C. The PNDP hydrolyzes on the resin powder to yield diphenyl phosphate (DPP) and p-nitrophenoxide. GRA

APPLICATION OF MICROWAVE HEATING FOR FABRICATION OF SILICON NITRIDE CERAMICS
Terry N. Tiegs, James O. Kiggans, and Kristin L. Ploetz 1993 13 p
Presented at the 17th Annual Conference on Composites and Advanced Ceramics, Cocoa Beach, FL, 11-15 Jan. 1993
(Contract DE-AC05-84OR-21400)
(DE93-006741; CONF-930164-7) Avail: CASI HC A03/MF A01

Microwave processing of silicon nitride-based ceramics was examined to identify aspects that would have advantages over conventional heating such as improved fabrication parameters or increased mechanical properties. Areas of microwave processing examined were sintering of powder compacts and sintering of reaction-bonded silicon nitride. The sintering of powder compacts showed improved densification and enhanced grain growth. However, the high additive levels required to produce crack-free parts generally limit these materials to low temperature applications. Sintered reaction-bonded silicon nitride materials were fabricated in the microwave with a one-step process using cost-effective raw materials. The materials had properties appropriate for structural applications. DOE

USE OF BLOCK COPOLYMER AS POLYMER BLEND COMPATIBILIZER Final Report, 1 Feb. 1989 - 31 Oct. 1992
R. J. Roe 30 Jan. 1993 13 p
(Contract DAAL03-89-K-0040)
(AD-A260435; ARO-26579.3-MS) Avail: CASI HC A03/MF A01

Mechanical properties of polymer blends can be improved by addition of block copolymers as compatibilizers. The objective of this study has been to systematically investigate the effect of an added block copolymer in order to gain understanding of the factors, such as the amount, size, and structure of block copolymer, that control the efficacy of the compatibilization. The rate of particle coarsening that occur at the late stage of phase separation has been shown to be affected sensitively by the presence of even a very small amount of block copolymer. On the assumption that the late stage proceeds by the Lipshitz-Slyozov mechanism, one can estimate the change in the interfacial tension resulting from the adsorption of block copolymer at the interface. The larger the block copolymer size is, the more pronounced is the reduction in the particle coarsening rate. When polymers are melt-blended, a larger block copolymer additive is again found to be more effective than smaller copolymers. GRA

(Contract N00014-90-J-1559)
(AD-A260002; Rept-1992-4) Avail: CASI HC A02/MF A01

The photoluminescence and photoinduced absorption are reported for leucoemeraldine and emeraldine forms of polyaniline in the picosecond to nanosecond time domain. The importance of bond vibration, charge tunneling, and ring rotations in varying relaxation processes is determined. The temperature dependence of the photoluminescence decay time of the leucoemeraldine base dissolved in N-methyl pyrrolidinone is reported. The decay time decreases as the temperature increases. From the Arrhenius plot, the activation energy is estimated to be approx. 0.1 eV. These data suggest that backbone vibrations dominate this photoluminescence decay mechanism. From the comparison of the result to that of the monomer, aniline, it is concluded that a polaron-exciton confined in the basic unit including a ring and adjacent nitrogen atoms is responsible for the photoluminescence. The picosecond photoinduced absorption of emeraldine base films optically pumped at 2.1 eV and probed at 1.5 eV and 2.9 eV are compared with the previously measured picosecond photoinduced

bleaching probed at 2.0 eV. While all three of them show initial fast decay, the photoinduced absorption at 1.5 eV does not show a substantial residue on the nanosecond time scale. This is in contrast to the photoinduced bleaching at 2.0 eV and 2.9 eV photoinduced absorption for which more than half of the signal remains even after a few nanoseconds. Preliminary measurements of emeraldine base films at a probe energy of 2.9 eV indicate that the decay slows down when the temperature is lowered. For emeraldine base in N-methyl pyrrolidinone solution, this long lived tail in picosecond photoinduced absorption disappears. These data strongly suggest the importance of the ring-torsion. GRA

CHEMICAL VAPOR INFILTRATION WITH MICROWAVE HEATING
D. J. Devlin, R. P. Currier, R. S. Barbero, and B. F. Espinoza 1992 7 p Presented at the 17th Annual Conference on Composites and Advanced Ceramics, Cocoa Beach, FL, 11-15 Jan. 1993
(Contract W-7405-eng-36)
(DE93-005458; LA-UR-92-4391; CONF-930164-2) Avail: CASI HC A02/MF A01

The use of microwave energy to heat substrates during chemical vapor infiltration (CVI) is described. Both numerical predictions and experimentally observed thermal profiles indicate that steep inverted thermal gradients can be established in fibrous preforms subjected to microwave radiation. When combined with the CVI technique, the inverted gradients can be exploited to promote inside-out densification. Recent microwave assisted CVI results, which focus on silicon based matrix materials, are described. Emphasis is placed on the role played by the relative ability of fiber and matrix to dissipate microwave energy. Issues central to further process development, such as the effect of interfacial coating on subsequent microwave processing, are discussed. DOE

OBTAINING HIGH-RESOLUTION IMAGES OF CERAMIC FROM 3-D X-RAY MICROTOMOGRAPHY BY REGION-OF-INTEREST RECONSTRUCTION
E. A. Sivers, D. A. Holloway, and W. A. Ellingson 1992 11 p Presented at the 17th Annual Conference on Composites and Advanced Ceramics, Cocoa Beach, FL, 11-15 Jan. 1993
(Contract W-31-109-eng-38)
(DE93-006796; ANL/MCT/CP-77181; CONF-930164-9) Avail: CASI HC A03/MF A01

3-D x-Ray imaging technology, when applied to advanced ceramics, is limited in some cases by detector sensitivity. This limitation can be overcome to some degree by the use of region-of-interest (ROI) reconstruction software. We have developed such software and applied it to 28 mm-diameter, injection-molded Si3N with known hole-type defects ranging in diameter from 25.4 to 508 microns. We have also applied the ROI concept to large (22 cm)-diameter Si3N4 turbocharger rotors, demonstrating the ability to resolve only the critical blade-hub region for each blade. DOE

BETA CLOTH DURABILITY ASSESSMENT FOR SPACE STATION FREEDOM (SSF) MULTI-LAYER INSULATION (MLI) BLANKET COVERS
Steven L. Koontz, Stephen Jacobs, and Julie Le (McDonnell-Douglas Corp., Houston, TX.) Mar. 1993 30 p
(NASA-TM-104748; S-669; NAS 1.15:104748) Avail: CASI HC A03/MF A01

MLI blankets for the Space Station Freedom (SSF) must comply with general program requirements and recommendations for long life and durability in the low-Earth orbit (LEO) environment. Atomic oxygen and solar ultraviolet/vacuum ultraviolet are the most important factors in the SSF natural environment which affect materials life. Two types of Beta cloth (Teflon coated woven glass fabric), which had been proposed as MLI blanket covers, were tested for long-term durability in the LEO environment. General resistance to atomic oxygen attack and permeation were evaluated in the high velocity atomic oxygen beam system at Los Alamos National Laboratories. Long-term exposure to the LEO environment was simulated in the laboratory using a radio frequency oxygen plasma asher. The plasma asher treated Beta cloth specimens were tested for thermo-optical properties and mechanical durability. Space exposure data from the Long Duration Exposure Facility and the Intelsat Solar Array Coupon were also used in the durability assessment. Beta cloth fabricated to Rockwell specification MBO 135-027 (Chemglas 250) was shown to have acceptable durability for general use as an MLI blanket cover material in the LEO environment while Sheldahl G414500 should be used only in locations which are protected from direct Ram atomic oxygen. MAGNETIC RESPONSE OF CERTAIN CURVED GRAPHITIC GEOMETRIES
L. Wang, P. S. Davids, A. Saxena, and A. R. Bishop 1992 7 p Presented at the 1992 International Conference on Science and Technology of Synthetic Metals, Goeteborg, Sweden, 12-18 Aug. 1992
(Contract W-7405-eng-36)
(DE93-003694; LA-UR-92-3232; CONF-9208132-5) Avail: CASI HC A02/MF A01

The quasi-particle energy spectra associated with some members of buckyfamily (curved graphitic geometries), in particular C50, C60, C70, and related fullerenes as well as coaxial helical microtubules of graphite, are obtained analytically within the mean-field approximation. These energy spectra are then used to calculate various response functions. Specifically, we calculate the specific heat, magnetization, and magnetic susceptibility in the presence of an external magnetic field at low temperatures. For a single microtubule an extra peak superimposed on the first de Haas van Alphen (dHvA) oscillation in magnetic susceptibility is found in the 50-170 Tesla range depending on the radius which is possibly accessible in special (explosive flux compression) experiments. Finally, we point to important potential applications of these novel mesoscopic structures in nanotechnology. DOE

This report presents results on low refrigerant concentration (70, 80, 90, and 100 weight percent lubricant) mixtures of the following fluids: CFC-12/ISO 32 naphthenic mineral oil; HCFC-22/ISO 32 naphthenic mineral oil; and HFC-134a/ISO 32 pentaerythritol ester mixed acid. These data have been reduced to engineering form and are presented in the form of a Daniel Chart. Scatter diagrams are given for the first fluid listed above, with the intent of illustrating the quality of data as well as providing the rationale for selecting the particular functional forms chosen to represent the experimental data. Equations are given along with statistical measures of goodness of fit. DOE

Research in recent years has demonstrated the efficient use of solar thermal energy for driving endothermic chemical reforming reactions in which hydrocarbons are reacted to form syngas. Closed-loop reforming/methanation systems can be used for storage and transport of process heat and for short-term storage for peaking power generation. Open-loop reforming and gasification systems can be used for direct fuel production; for production of syngas feedstock for further processing to bulk ammonia, hydrogen, and liquid fuels; and for destruction of hazardous organic materials. To help identify the most promising areas for future development of this technology, we discuss in this paper the market potential of these applications. DOE

DEVELOPMENT OF RATE EXPRESSIONS FOR THE THERMAL DECOMPOSITION OF RDX
K. L. Erickson, R. Behrens, Jr. (Sandia National Labs., Livermore, CA.), and S. Bulusu (Army Armament Research, Development and Engineering Center, Picatinny Arsenal, NJ.) 1992 11 p Presented at the 29th JANNAF Combustion Meeting, Hampton, VA, 19-23 Oct. 1992
(Contract DE-AC04-76DP-00789)
(DE93-005345; SAND-92-1135C; CONF-9210112-4) Avail: CASI HC A03/MF A01

Decomposition and combustion of energetic materials involve processes in both condensed and gas phases. Development of reliable models for design, performance, stability, and hazard analyses requires detailed understanding of the mechanisms for both the initial condensed phase decomposition of the energetic material and the subsequent reaction of the decomposition species to form the ultimate reaction products. Those mechanisms must be described in terms of constitutive rate expressions that can be incorporated into mathematical models. The thermal decomposition of RDX has been studied by Behrens and Bulusu using Simultaneous Thermogravimetric Modulated Beam Mass Spectrometry (STMBMS). Their work provides a basis for developing some of the constitutive rate expressions that are needed in models for design, performance, stability and hazard analyses involving RDX. Behrens and Bulusu have identified four primary reaction pathways that control the liquid-phase decomposition of RDX at temperatures between 200 and 215 C, and one that controls solid-phase decomposition at temperatures below 200 C. Two of the liquid-phase pathways appear to be first order in RDX. Arrhenius parameters for the first-order rate constants were evaluated from data reported by Behrens and Bulusu. Reaction rates extrapolated to temperatures between 370 and 450 C are in good agreement with global reaction rates observed by Trott et al. using high-speed photography and laser-heated thin-film samples. Furthermore, the STMBMS results of Behrens and Bulusu appear to be consistent with condensed-phase infrared results reported by Trott et al. and Erickson et al. DOE

XYLOSE FERMENTATION TO ETHANOL
J. D. McMillan Jan. 1993 46 p
(Contract DE-AC02-83CH-10093)
(DE93-000067; NREL/TP-421-4944) Avail: CASI HC A03/MF A01

The past several years have seen tremendous progress in the understanding of xylose metabolism and in the identification, characterization, and development of strains with improved xylose fermentation characteristics. A survey of the numerous microorganisms capable of directly fermenting xylose to ethanol indicates that wild-type yeast and recombinant bacteria offer the best overall performance in terms of high yield, final ethanol concentration, and volumetric productivity. The best performing bacteria, yeast, and fungi can achieve yields greater than 0.4 g/g and final ethanol concentrations approaching 5 percent. Productivities remain low for most yeast and particularly for fungi, but volumetric productivities exceeding 1.0 g/L-h have been reported for xylose-fermenting bacteria. In terms of wild-type microorganisms, strains of the yeast Pichia stipitis show the most promise in the short term for direct high-yield fermentation of xylose without byproduct formation. Of the recombinant xylose-fermenting microorganisms developed, recombinant E. coli ATTC 11303 (pLOI297) exhibits the most favorable performance characteristics reported to date. DOE

USE OF NEW OXYGENATES AS GASOLINE COMPONENTS [UUSIEN OKSYGENAATTIEN KAYTTO BENSIINIKOPONENTTEINA]
Nils-Olof Nylund, Matti Kyto, Markku Ikonen, Aimo Rautiola (Neste Oy, Porvoo, Finland.), and Jussi Kokko (Neste Oy, Porvoo, Finland.) 1992 94 p In FINNISH
(DE93-752864; VTT-TIED-1364) Avail: CASI HC A05/MF A01

In addition to conventional hydrocarbons, oxygen-containing component - oxygenates - are generally used in gasoline to replace lead compounds as octane boosters and to reduce exhaust emissions. Such components

are alcohols and ethers, of which methyl tertiary butyl ether (MTBE) is most commonly used. Three gasoline grades were studied experimentally by engine and car tests in the laboratory and by a field test with 20 passenger cars. One of the fuels was a reference gasoline containing solely hydrocarbons, the second one contained 11 percent MTBE and the third one 13 percent ethyl tertiary butyl ether (FTBE). The oxygen content of the oxygenate-containing gasolines was 2 weight-percent. Neither the engine performance measurements nor the field test gave differences in gasoline consumption or engine output. In driveability tests in the laboratory, the oxygenate gasolines were in cold conditions superior to the reference gasoline, while no significant differences were observed in the hot-driveability test. On the basis of the road octane requirement tests, a slightly higher octane number is required for the oxygenated fuels than for the hydrocarbon fuel. When using oxygenated fuels, the CO emission of the non-catalyst cars was reduced by 15-20 percent and the HC emission by about 5 percent. The corresponding reductions for the catalyst cars were 0-10 percent (CO) and about 10 percent (HC). The fuel had no effect on the NO(sub x) emission. At the cold test of 30 min at -20 and +-0 deg C the CO emission of the threeway catalyst engine was reduced on average by 7 percent and the HC emission by 6-11 percent. DOE

BIOFUELS PROGRAM PLAN, FY 1992 - 1996
Jan. 1993 40 p
(Contract DE-AC02-83CH-10093)
(DE93-000036; DOE/CH-10093/186) Avail: CASI HC A03/MF A01

This five-year program plan describes the goals and philosophy of the US Department of Energy's (DOE) Biofuels Systems Division (BSD) program and the BSD's major research and development (R&D) activities for fiscal years (FY) 1992 through 1996. The plan represents a consensus among government and university researchers, fuel and automotive manufacturers, and current and potential users of alternative fuels and fuel additives produced from biomass. It defines the activities that are necessary to produce versatile, domestic, economical, renewable liquid fuels from biomass feedstocks. The BSD program focuses on the production of alternative liquid fuels for transportation--fuels such as ethanol, methanol, biodiesel, and fuel additives for reformulated gasoline. These fuels can be produced from many plant materials and from a significant portion of the wastes generated by municipalities and industry. Together these raw materials and wastes, or feedstocks, are called biomass. DOE

DIRECT CONVERSION OF LIGHT HYDROCARBON GASES TO LIQUID FUEL
R. D. Kaplan and M. J. Foral 16 May 1992 107 p
(Contract DE-AC22-89PC-89866)
(DE93-004916; DOE/PC-89866/T10) Avail: CASI HC A06/MF A02

Amoco Oil Company has investigated the direct, non-catalytic conversion of light hydrocarbon gases to liquid fuels (particularly methanol) via partial oxidation. The primary hydrocarbon feed used in these studies was natural gas. Work completed in the course of the two-year project is described. In general, the methanol yields delivered by this system were not high enough to make it economically attractive. Process variables studied included hydrocarbon feed composition, oxygen concentration, temperature and pressure effects, residence time, reactor design, and reactor recycle. DOE

REACTING LIQUID MONOPROPELLANT SPRAYS: EXPERIMENTS WITH HIGH VELOCITY FULL CONE SPRAYS IN 33 MPa, 500 C NITROGEN
Final Report, Feb. 1990 - Feb. 1992
Avi Birk, Michael McQuaid, and Gary Bliesener Dec. 1992 63 p
LIMITED REPRODUCIBILITY: Availability: Document partially illegible
(AD-A259799) Avail: CASI HC A04/MF A01

Experiments were conducted to elucidate the jet breakup, atomization, and combustion of liquid monopropellant sprays through the use of imaging and spectroscopic techniques. Hydroxylammonium nitrate (HAN) based monopropellants LGPI845 and LGPI898 were injected at velocities ranging from 100 to 240 m/s through circular orifices into 33-MPa 500 C nitrogen. Experiments with nitromethane, ethanol, and aqueous HAN and TEAN solutions were also conducted. Spray dynamics were recorded via high-speed cinematography. Breakthroughs in the imaging of combusting sprays were achieved by side illumination of the sprays with pulsed laser light sheets, and by seeding the propellants with nitrate salts of sodium or lithium to enhance flame luminosity. Emission spectroscopy was used to identify combustion intermediates and their relative contribution to color content in the cinematic images. Temperature measurements at the center of the sprays provided additional information regarding spray structures and reactivities. In the experiments reported here, sprays ignite in the far-field and flame advances upstream sustained by extensive turbulent gas recirculation in the closed chamber. The experiments reveal the presence of large liquid drops as well as intense, random burning in vortices. The experiments with nitromethane and ethanol indicate that the dynamic behavior of sprays change when the ambient temperature and pressure exceed critical values. The experimental results are discussed in the context of understanding and modeling spray combustion phenomena in regenerative liquid propellant guns. GRA

1991 CRC OCTANE NUMBER REQUIREMENT SURVEY
Oct. 1992 98 p
(AD-A259821; CRC-580) Avail: CASI HC A05/MF A02

An annual statistical survey of octane number requirements of current model vehicles is conducted by the Coordinating Research Council, Inc. Test data have been obtained by fifteen companies on 262 1991 vehicles including passenger cars and light-duty trucks and vans, of which 105 were equipped with knock sensors. Octane number requirements were determined by testing at maximum-throttle conditions, as well as at part-throttle, with four unleaded fuel series of varying sensitivities, one containing 15 percent methyl tertiary butyl ether. Requirements are expressed as the (R+M)/2 octane number, research octane number, and motor octane number of the reference fuel producing knock which was recurrent and repeatable at the lowest audible level. Estimated octane number requirements for the total vehicles are weighted in proportion to the 1991 vehicle model production and/or sales figures. GRA

Catalytic testing of inorganic catalysts was continued with the highly active sulfate-modified zirconia catalyst prepared here. Using isobutanol as the only reactant over this catalyst, it was demonstrated that high conversion and selectivity to isobutene was achieved at 175 C. In addition, the high selectivity to isobutene, i.e., 79-86 mol percent, was maintained at higher space velocities and higher temperatures. A high productivity of 11.35 mol isobutene was achieved at 225(degrees)C. Utilizing a methanol/isobutanol = 2/1 molar ratio reactant mixture over the ZrO2/SO4(sup 2-) catalyst, it was shown by a contact time study that the reaction conditions employed here fall in the differential reaction regime. It was found that the isobutene selectivity among the butenes produced hardly varied at a function of contact time and conversion level of isobutanol. Also indicating that the linear 2-butenes are primary products. A separate study showed that the yield of dimethylether increased as the pressure of methanol by itself was increased over the ZrO2/SO4(sup 2-) catalyst, and these yields were higher than those in the presence of isobutanol. A new supported heteropolyacid catalyst was prepared by supporting phosphotungstic acid (H3PW12O40) on silica gel to the level of 20 wt percent. It was shown that the same activities and selectivity patterns were obtained from methanol/isobutanol = 1/1 reactants whether the catalysts were calcined at 100 C or 200 C. It was shown that the activity and selectivity of these catalysts toward isobutene were increased by increasing the reaction temperature. However, under the set of reaction conditions employed, these catalysts were not better than the ZrO2/SO4(sup2-) catalyst. DOE

Overall mass transfer coefficients for CO have been determined in a

continuous stirred-tank reactor at agitation rates of 300-700 rpm using a biological system with the photosynthetic bacterium Rhodospirillum rubrum. A non-steady state approach was employed in order to separate mass transfer and kinetic limited regions of the fermentation. As a result, a kinetic model could be developed for specific CO uptake by the culture including the apparent CO inhibition. The maximum specific CO uptake rate found matched the earlier results obtained in batch culture and by other investigators. CO inhibition was more predominant in CSTR culture than in batch culture, perhaps due to CO acclimation. The growth of the photosynthetic bacterium Chlorobium thiosulfatophilum on CO2 has been studied at light intensities ranging from 27-1723 lux in batch culture. Modeling results indicate that growth is dependent upon light intensity according to a Monod type relationship. DOE

As the Air Force continues to advance engine technology, aviation fuel heat loading has steadily increased. Therefore, a thermally stable JP-8 fuel is required that can operate at higher temperatures than current fuels. This research program had two objectives: to identify fundamental conditions of fuel thermal decomposition, and to provide the data needed to develop and evaluate global chemistry and heat transfer models for predicting jet fuel thermal decomposition and deposition rate. We successfully designed and performed numerous static and flowing experiments on a variety of JP fuels. These experiments illuminated the role of antioxidants, peroxides, ketones, and hetero-atom sulfur molecules in the oxidation of surrogate JP-8 and and jet fuels. We developed an autooxidation theory which distinguishes oxidative stability from thermal stability and accounts for the observed oxygen consumption and methane production. Also, we examined several additives and found a select few which produce the least deposits. Finally, our data led to the evaluation and refinement of global chemistry and heat transfer models for predicting jet fuel deposition rates. GRA

REACTION/SEPARATION PROCESS FOR ENHANCED METHANE CONVERSION Annual Report, Oct. 1991 - Sep. 1992
J. L. Falconer and R. D. Noble Dec. 1992 14 p Sponsored by Gas Research Inst., Chicago, IL
(Contract GRI-5090-260-2005)
(PB93-150985; GRI-92/042) Avail: CASI HC A03/MF A01

Temperature and methanol feed rate control were improved by upgrading the apparatus. At low and high temperatures (126 and 205 C), methanol separation factors higher than those predicted by Knudsen diffusion were obtained. A new reactor system that consists of a cold finger located coaxially inside the tubular membrane was built, and partial oxidation of methane over silica supported molebdena catalyst was carried out. At 5-8 percent methane conversion, 35-40 percent methanol selectivity was obtained in the nonisothermal system compared to the 15-20 percent in an isothermal system. Model consisting of mass and mechanical energy balances was formulated and simulated for butane dehydrogenation. Optimal membrane pore diameter of 4-nm, and optimal ratio of inlet innersweep gas flow rate to inlet butane flow rate of 4 were computed for maximum butane conversion. Model consisting of mass balances was formulated for methane partial oxidation to formaldehyde in an inert sweep cocurrent membrane reactor. Optimal membrane reactor performance was not better than the performance of a plug flow reactor under all simulated conditions. GRA

Work progress is reported in brief. A summary of this information is provided below. An in-depth study was performed to evaluate a new European designed Borack Freezer/Cooler for possible shuttle middeck flight to support advanced protein crystal growth (APCG) experimentation. A statement of work was prepared for the design and development of a glovebox for proposed flight in the shuttle middeck. Work was also initiated to perform an analysis of low-g accelerometer data relative to Fluid Experiment System (FES) experiment options on the IML-1 mission. This work was undertaken in an effort to determine if abnormally low-g accelerations during the mission were responsible for anomalies which occurred during FES/Triglycine Sulfate (TGS) experiment operations. A comprehensive review was made on a revised edition of the Geophysical Fluid Flow Cell (GFFC) Operations and Maintenance (O&M) Manual.

The conference was aimed at bringing together 'intentional' microgravity, modeling and ground simulation, and 'involuntary' microgravity, the environment to which engineering must adapt, so that hardware designed for use on the ground can be made to work in space. Papers are presented under the following subheadings: heat and mass transfer; combustion; interface phenomena; polyphase flows; and critical phenomena. Conclusions on these studies are summarized and the need for test facilities for future programs is highlighted. For individual titles, see N93-22831 through N93-22866.

An overview of the most powerful optical techniques applicable in space environments is given. Some tracing techniques, for the velocity field visualization, are introduced and, in particular, the photometric method is illustrated. The application of this method to single phase bulk fluids and to a fluid-fluid two phase system are presented. Two techniques were developed both for single point velocity measurements (Laser Doppler Velocimetry (LDV)) and for velocity field measurements (Particle Image Velocimetry (PIV)). The interferometric and holographic techniques for the temperature and concentration fields investigation are treated by looking at their application to microgravity platforms. As an interesting alternative to the above mentioned interferometric techniques, the laser deflectometer is presented. Light scattering techniques for particle size analysis are considered. Particular emphasis is given to low angle light scattering particle sizers. Static and dynamic light scattering techniques are also considered. An all optical ultrasound generation detection system, the LUD (Laser Ultrasound Diagnostic) for the investigation of opaque high temperature fluids is introduced. ESA

THE SCIENTIFIC MICROGRAVITY FLUID MECHANICS PROGRAM OF ZARM

Hans J. Rath and Michael Dreyer *In* ESA, Fluids in Space Jun. 1992 p 27-46 (For primary document see N93-22830 08-29)

Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The aims of the ZARM program, which is concerned with fluid mechanics research under microgravity, are given together with an overwiew of the program. The microgravity program consists of experimental and theoretical projects. Numerical methods are very important for the validation of experimental results. Furthermore, ZARM is developing modern optical diagnostic systems for applications in microgravity research. At the moment ZARM is reponsible for more than 20 scientific research projects. Research in the areas of microgravity, fluid mechanics, including process technology, combustion, and thermodynamics, and the investigation of the flow of nonnewtonian and multiphase fluids, are the principle areas of interest of ZARM. Most of the experiments can be carried out within a few seconds so the drop tower is an ideal microgravity laboratory for these experiments. A description of the drop tower is given. The scientific goals of the experiments are discussed. These included investigations into the following: elongated viscosity of fluids; simulation of the flow of large scale ocean motions; measurement of heat conductivity in fluids: the influence of gravity on thermal anemometers; polyreactions in microgravity; combustion on free surfaces; and the Weissenberg effect. ENGINEERING ASPECTS OF TWO-PHASE FLOW SYSTEMS FOR HEAT TRANSPORT **c34**

W. Supper *In its* Fluids in Space Jun. 1992 p 47-59 (For primary document see N93-22830 08-29)

Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The basic principles of two phase technology for the thermal management of spacecraft are presented. An overview of ESA activities in this field, namely the development of a mechanically pumped and a capillary pumped two phase heat transport system and the development of a two phase experiment for on orbit demonstration is given. For both the mechanically and capillary pumped two phase loop, a development model was designed, manufactured, and extensively tested. Both systems worked well and the results achieved were promising. ESA

LIQUID DROPLET RADIATOR: DESIGN CONCEPTS AND DEVELOPMENT LOGIC **c31**

Alois Koeppl and Bernhard J. G. Leidinger *In* ESA, Fluids in Space Jun. 1992 p 61-78 Prepared in cooperation with Erno Raumfahrttechnik G.m.b.H., Bremen, Germany (For primary document see N93-22830 08-29)

Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The results and deduced development logic of an investigation of a Liquid Droplet Radiator (LDR) with a heat rejection capability of 20 kW for aplications in low Earth orbits are presented. Liquid droplet radiators stand out for their efficiency compared to that of conventional radiators. The waste heat is radiated from the cooling fluid directly to the surrounding space. The actual radiator consists of a sheet of droplets of the cooling fluid. The droplets carrying the waste heat emanate from a droplet generator, transfer the waste heat to the space by radiation, and are collected in a droplet collector afterwards. From there the fluid is pumped back, absorbs waste heat in a heat exchanger or cold plate, and returns to the droplet generator. The potential fields of application and the requirements of the LDR are addressed. Details of the droplet generator, droplet sheet and droplet collector are given. A preliminary sizing was performed. NATURAL AND MARANGONI CONVECTION IN TWO SUPERPOSED IMMISCIBLE LIQUID LAYERS WITH HORIZONTAL HEATING **c34**

L. G. Napolitano, A. Viviani, and R. Savino *In* ESA, Fluids in Space Jun. 1992 p 79-108 (For primary document see N93-22830 08-29)

Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Thermal Marangoni and natural convection are studied in two superposed immiscible fluid layers enclosed in a shallow rectangular cavity with differentially heated end walls. The horizontal rigid walls are considered either insulated or with a given temperature distribution. The problem was solved via the asymptotic expansions method, by expanding the field variables in power series of the small aspect ratio parameter; both the zeroth and first order approximations are given for each of the boundary conditions in the rigid horizontal walls. The solution is discussed when natural convection prevails in one layer or in both, when there is only Marangoni convection, and, finally, in the case of combined free convection. ESA

CONTINUOUS-FLOW ELECTROPHORESIS: HYDRODYNAMICS, HEAT AND MASS TRANSFER WITH AND WITHOUT GRAVITY

M. J. Clifton and V. Sanchez *In* ESA, Fluids in Space Jun. 1992 p 109-119 Sponsored by CNES (For primary document see N93-22830 08-29)

Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Research aimed at the use of microgravity as a suitable environment for studying phenomena of continuous flow electrophoresis in the analysis of biological molecule mixtures without interference from gravitational effects is presented. A model for electrokinetics in electrophoresis is presented. The electrodynamics is investigated. A finite difference technique was used for the hydrodynamic part of the model. The model was used to estimate the behavior of samples containing only one protein at various concentrations. An experimental program in rocket flights is planned. ESA

ELECTRICALLY DRIVEN CONVECTION

Felix Weinberg *In* ESA, Fluids in Space Jun. 1992 p 123-129 (For primary document see N93-22830 08-29)

Copyright Avail: CASI HC A02/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

A simple, inexpensive, and lightweight method of generating convective flows in gases under microgravity conditions is addressed. It involves the application of large electric fields to ions and other particles present in the gas. Theoretical analysis shows that body forces up to 800 times that due to Earth gravity are attainable. The application of this principle to heat and mass convection is discussed with particular reference to controlling combustion in microgravity environments. Illustrations drawn from the field of combustion, which are likely to find application in microgravity, include manipulating flames, inducting air and fuel, removing hot products, decreasing heat transfer to walls, as well as directing heat flux to surfaces to be heated. ACTION OF AN ACCELERATION FIELD ON PREMIXED METHANE/AIR FLAMES [ACTION DU CHAMP D'ACCELERATION SUR LES FLAMMES DE PREMELANGE METHANE/AIR] **c25**

R. Prudhomme and D. Durox *In* ESA, Fluids in Space Jun. 1992 p 131-144 In FRENCH (For primary document see N93-22830 08-29)

Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

A description of the centrifuge used to produce accelerations up to 200 G is given. This centrifuge was used to study the effect of an acceleration field on the oscillations of premixed methane/air flames. The burner used to produce the flame and the installation used in parabolic flight are described. It was noted that the flame oscillations produced in an acceleration field disappear in microgravity. A law connecting the oscillation frequency with the acceleration field was derived, and mathematical models explaining this derivation are given. ESA

PRACTICAL PROBLEMS RELATED TO FLAMMABILITY AND COMBUSTION IN SPACE **c25**

M. D. Judd *In its* Fluids in Space Jun. 1992 p 145-161 (For primary document see N93-22830 08-29)

Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Requirements and tests imposed on materials for use in manned spacecraft are described with particular emphasis on those related to flammability and toxicity. Practical examples are given to illustrate the main problem areas and are related, whenever possible to corresponding data obtained during flight. It is hoped, in this manner, to clarify to the 'scientist' the problems faced by the 'safety engineer' and thus bring about a greater understanding of the need for the various requirements imposed. The currently used flammability tests which are described are: upward propagation test; configuration test; and electrical wire insulation test. Future flammability tests described involve the cone calorimeter, which works on the principle of oxygen depletion measurement (based on the direct relationship between oxygen consumption and heat release), and arc tracking. Flight results are discussed and the test apparatus is described. ESA

INFLUENCE OF GRAVITY ON POLYEDRIC FLAMES [EFFETS DE LA GRAVITE SUR LES FLAMMES POLYEDRALES] **c25**

D. Durox *In* ESA, Fluids in Space Jun. 1992 p 163-176 In FRENCH (For primary document see N93-22830 08-29)

Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Tests carried out during parabolic flight to see the effect of three different levels of gravity, 0, 1, and 1.8 G on propane and air polyedric flames are described and results and conclusions are given. Among other factors, it was found that gravity has a stabilizing effect on flame fronts spreading towards the base even if the front is inclined towards the horizontal. The suppression of natural convection favors long wavelengths; there is in general a loss of facet of the polyhedron at 0 G when the number of facets at 1 G is between 5 and 8. The absence of neutral convection increases the division in temperature between the border and the center of the flame cells (divisions). Photographs of the flames clearly illustrate these divisions. In wide edged flame holders truncations appear at the summit of the pholyhedron in microgravity whereas the flames are polyhedral (or conical) at 1 G. ESA

THE STUDY OF SURFACE TENSION TANKS FROM THE NEUTRAL BUOYANCY TO THE SPACE FLIGHT [L'ETUDE DES RESERVOIRS A TENSION SUPERFICIELLE DE LA FLOTTAISON NEUTRE AU VOL SPATIAL]

Eric Ducret *In* ESA, Fluids in Space Jun. 1992 p 195-211 In FRENCH (For primary document see N93-22830 08-29)

Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Tools for studying physical aspects of fluid motion in a new class of Propellant Management Devices (PMD) are described. These PMD's are required to deliver an increased volume of propellant in order to allow the thrusters to operate for longer periods. An experimental bench allows, in balancing gravity by the Archimede's effect, the simulation of a microgravity environment. The difference between the density of the fluids used is controlled by thermal regulation which constrains the study to a steady state acceleration field. A software model takes into account the basic theoretical data, particularly a pressure drop analysis through the vanes and the sponge. It is intended to match this model with the experimental results. This tool calculates two essential parameters, the maximal usable volume and the refilling time of the PMD. To overcome the limitations of software and experimental simulation, a full scale experiment will be carried out on board the Soviet Space Station Mir. It will show the real functioning of the PMD and will eventually allow the updating of the simulation tools on ground. ESA

ADSORPTION KINETICS AT LIQUID-LIQUID INTERFACES IN MICROGRAVITY CONDITIONS. EXPERIMENTAL APPROACH AND THEORETICAL BACKGROUND

F. Ravera, L. Liggieri (Consiglio Nazionale delle Ricerche, Genoa, Italy.), A. Passerone (Consiglio Nazionale delle Ricerche, Genoa, Italy.), and A. Steinchen *In* ESA, Fluids in Space Jun. 1992 p 213-221 Sponsored in part by ESA (For primary document see N93-22830 08-29)

Copyright Avail: CASI HC A02/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

A method (pressure derivative) for measuring interfacial tension between immiscible fluids phases at zero bond number, was developed. The method is extended to measurements of nonequilibrium interfacial tension and follows the kinetics of diffusion and/or adsorption to the interface, of a surfactant solved in the external phases, in which the drop has been rapidly grown. The development of the experimental procedure to obtain the dynamic interfacial tension from dynamic capillary pressure data is presented. An equation describing the dynamics of the interfacial aging, obtained by considering the adsorption as an extended diffusion process with boundary conditions deduced from microscopic consideration, is presented. This equation allows experimental data to be interpreted, and from this, the molecular activation energies for adsorption and desorption to be deduced. ESA

HEAT AND MASS TRANSFER IN POLYPHASE FLOWS **c34**

H. J. Rath and A. Delgado *In* ESA, Fluids in Space Jun. 1992 p 225-243 (For primary document see N93-22830 08-29)

Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

An overview of problems related to heat and mass transfer in polyphase flows, which play a very important role not only in fluid flow systems under compensated gravity conditions but also in various applications in space technology, is given. On the basis of the governing equations for mass, momentum and energy, different topics are discussed. Problems related to the significance of the presence of gravity in comparison with other forces in polyphase flows are addressed. Dimensionless parameters are indicators of the ratios of such forces. When comparing to the flow of a pure, one phase flow some additional parameters are of importance: concentration, density and viscosity ratios as well as other dimensional groups. The patterns found in polyphase flows depend strongly on the phases involved, their extent and the flow conditions available. Some fundamental research problems in space and under compensated gravity, and examples of applications, are discussed. Investigations of polyphase flows carried out in drop tower are also presented. RESEARCHES AND DEVELOPMENTS ON TYPICAL THERMAL TECHNOLOGIES FOR SPACE APPLICATIONS **c34**

M. Dubois and S. VanOost *In* ESA, Fluids in Space Jun. 1992 p 245-259 (For primary document see N93-22830 08-29)

Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The frame of inhouse or ESA programs, as well other research and development in the field of two phase thermal technologies for space

applications, are presented. An overview of classical heat transport systems used in space thermal control is given and recent results of heat pipes and two phase loops are presented: the development of a so called High Capacity Grooved heat Pipe (HGP), based on the thermal requirements of the new generation of telecommunication satellites, is addressed. The experimental maximum heat transport capability was found near 1500 Wm (horizontally at 20C) for a required 600 Wm while the maximum tilt capability was measured between 15 and 20 mm (at 20C). The test results of an aluminum/ammonia two phase Capillary Pumped Loop (CPL) are shown. This reliable development loop presents a heat transport capability between 250 W and 7.5 kW over a distance of 10 m. A comparative study for CPL evaporator designs is presented and discussed, emphasizing the thermal and hydraulic aspects. Looking for future potential space applications, some guidelines for research and development in two phase thermal technology are described, especially the ESA capillary pumped two phase experiment, which will allow a downscaled version of the CPL to be tested in a microgravity environment. Grandpeix (Toulouse Univ., France.), and O. Fudym (Toulouse Univ., France.) *In* ESA, Fluids in Space Jun. 1992 p 261-267 (For primary document see N93-22830 08-29)
Copyright Avail: CASI HC A02/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The design characteristics, the first experimental data and two thermal mathematical models (FLUINT and ZOOM) of a two phase freon 12 capillary pumped loop are presented. This loop mainly consists of two parallel evaporators and isolators, one condenser, one reservoir (to control the loop temperature), two adiabatic pipes (one for liquid and one for vapor) and instrumentation. Different kinds of cylindrical evaporators are tested. The main design characteristics of the evaporators is an axially grooved profile with a polyethylene wick. Experimental performances already obtained are encouraging (1800 Pa for the capillary pumped pressure with a 10 micron wick). Therefore, heat transport capability up to 750 kW/m can be envisioned for a similar ammonia loop. Up to 5000 W could be transported along an equivalent distance of 150 m (in a 20 mm straight vapor pipe at 20C with a 10 micron wick, neglecting the condenser and liquid return pipe pressure drop). Such a loop, today in development, is also presented. ESA

BOILING UNDER MICROGRAVITY CONDITIONS
J. Straub, M. Zell, and B. Vogel *In* ESA, Fluids in Space Jun. 1992 p 269-297 Sponsored by BMFT (For primary document see N93-22830 08-29)
Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The present state of the art on boiling under microgravity at the various modes of heat transfer such as nuclear boiling, critical heat flux and film boiling, are addressed. The microgravity results are compared to data obtained under the same conditions with Earth gravity. The mechanisms of heat transport are discussed and comments are made in respect to further experimental and theoretical studies under microgravity for a better understanding of the complex boiling process. It is noted that buoyancy acting on the bubbles and buoyancy free convection are not the only dominating mechanisms controlling the heat transfer. The buoyancy can be replaced by other powerful mechanisms that maintain boiling and keep the heat transfer at nearly the same level during nucleate boiling. Most important are the effects caused by the surface tension at the interface, however, the physical reasons behind the process are not yet completely understood and the interpretations made must be regarded as preliminary. The problems of modeling turbulent two phase gas liquid flow, which must be overcome in order to predict the fields of velocity and void ratio in complex geometries, are illustrated in the case of bubbly flow. These problems are the void ratio distribution by the mean motion of the continuous phase and the turbulent dispersion, and the evolution of interfacial area, in other words of bubble size. These two problems which are the stumbling block of three dimensional two fluid models are discussed in the very simple case of pipe flow. It is shown from a simplified momentum balance and theoretical grounds that microgravity conditions contribute to the understanding of the role of the different forces. The experiments performed up to now at ground or under microgravity conditions are not sufficient enough to be able to isolate each of the afore-mentioned problems. Two basic experiments which will be performed in future parabolic flights are presented. They are: the pipe flow of bubble of given size, and the 'turbulence box' for investigating the breakup or coalescence of bubbles. Some preliminary results obtained in ground experiments on breakup are presented and discussed. ESA

THERMODYNAMICAL BEHAVIOUR OF SUPERCRITICAL OXYGEN IN THE HERMES SPACEPLANE ENVIRONMENTAL CONDITIONS
P. Bravais *In* ESA, Fluids in Space Jun. 1992 p 331-339 (For primary document see N93-22830 08-29)
Copyright Avail: CASI HC A02/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The thermodynamic behavior of the oxygen and hydrogen used by the fuel cell powerplant and the life support systems of the Hermes European Spaceplane is investigated. The oxygen and hydrogen are stored in single state supercritical state. To maintain this state, despite the mass flow depleted from the tanks, the fluids are heated by electrical resistors (a few hundreds of watts) with on/off control to match pressure level. The low conductivity of the fluids and the absence of convection produce gradients greater than 300K over a few centimeters, which can result in hot points and explosion. Moreover, in case of accelerations of the Spaceplane (orbital readjusting or docking), convection appears which causes the mixing of the fluid and a pressure collapse. The latter can be such that the fluid returns to the diphasic state which results in fuel cell failure. Determining the thermodynamic behavior of the fluids and heater support design is accomplished by the use of a computer program which solves the Navier-Stokes and energy equations, using the finite element method. Heat conduction transfer, free and forced convection, radiation and pressure strength work are taken into acount. Equations of state are used for thermodynamic fluid properties due to their large nonlinear variations. ESA

THE INFLUENCE OF GRAVITY ON THE EQUILIBRIUM AND THE GROWTH OF TENUOUS STRUCTURES

C. Allain, C. Amiel (Centre National de la Recherche Scientifique, Thiais, France.), M. Cloitre, and M. Wafra *In* ESA, Fluids in Space Jun. 1992 p 341-355 (For primary document see N93-22830 08-29)
Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The effect of gravity on the equilibrium and the growth of tenuous structures which are encountered in heterogeneous media of condensed matter is dealt with. Percolation and irreversible aggregation models which result in such tenuous structures are reviewed and the different situations which are expected depending on the forces which oppose gravity, to the characteristic times which are involved and the concentration of the medium, are discussed. Experimental results obtained in weakly connected gels where gravity is responsible for a segregation phenomenon and on colloidal dispersions where gravity is observed by induced aggregation, are reported. ESA

HEAT AND MASS TRANSPORT IN A HYPERCOMPRESSIBLE FLUID UNDER ZERO GRAVITY
Y. Garrabos, F. Perrot (Centre National de la Recherche Scientifique, Villetaneuse, France.), and D. Beysens (Centre National de la Recherche Scientifique, Villetaneuse, France.) *In* ESA, Fluids in Space Jun. 1992 p 357-388 Sponsored in part by CNES (For primary document see N93-22830 08-29)
Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

In order to investigate the different aspects of the transport of heat and mass in the absence of gravity, a thermal cycle is performed close to and around the critical point of CO2 at critical density. A cell was designed which allows surface and bulk phenomena to be distinguished. Special optical devices were used to observe the sample and measure locally temperature and density. Experiments under Earth's gravity a few mK close to the critical temperature (Tc) are presented. They enable convection patterns to be observed and Grashof number as large as 100,000 to be measured. The thermal cycle of the experiment in weightlessness starts at (Tc + 2)mK, where the relaxation of the perturbations caused by liftoff are studied: fluid flows, density and temperature gradients. The effect of a quench from (Tc + 2)mK to (Tc + 1)mK is investigated, and the expected mechanism of heat transport by the Piston Effect (PE) is unambiguously evidenced. In particular, homogeneous thermalization of the sample is observed. A quench at (Tc + 1)mK is performed. The onset of phase separation is observed, making a clear visualization of the PE. Thereafter, spinodal decomposition occurs, followed by the growth of a bicontinuous pattern of gas and liquid domains whose typical scaled wavelength evolves as in density matched critical binary liquids. In addition, rapid density fluctuations are observed whose origin is unclear. After a last quench back to (Tc + 2)mK, the PE is still observed in spite of the presence of density gradients. These gradients are seen to relax by diffusion. ESA

PHASE SEPARATION UNDER A WEAK CONCENTRATION GRADIENT **c25**
Y. Jayalakshmi, B. Khalil, and D. Beysens *In* ESA, Fluids in Space Jun. 1992 p 389-403 Sponsored by CNES (For primary document see N93-22830 08-29)
Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Phase separation dynamics were studied in a density matched liquid mixture cyclohexane plus deuterated cyclohexane plus methanol in the presence of a weak linear concentration gradient. Concentration gradient is induced by slowly heating the sample from its two phase coexistence below critical temperature (Tc) to one degree above Tc without external agitation. After several hours of mass diffusion smooth concentration profile is formed over the height of the sample. The sample is quenched by pressure into the two phase region within the linear region of the concentation profile. All the quenches are within 3 to 40mK below Tc. The phase separation photos show a central 'fast growth' zone of interconnected structures for concentrations around critical concentration and on either side of the fast zone there is the 'slow growth' zone of isolated droplets. The slow zone width grows in time and saturates at the coexistence width at long time. The major result is that the fast growth zone is of a constant concentration width of 0.018 +/- 0.0025 for all the quench depths. This constant width is in contradiction with the expected boundary at the percolation volume fraction threshold between the coalescence induced and coalescence free growth regimes, but supports the concept of spinodal nucleation. Analysis of the time evolution of the slow zone width agrees with the expected dependence of the initial supersaturation with reduced time in the Langer-Schwartz nucleation theory. The initial width of the slow zone is used to draw the cloud line at the extreme limit of zero observation time. Preliminary light scattering data indicate a clear jump in the value of the growth exponent between the two growth zones. ESA

BURNING CHARACTERISTICS OF n-HEPTANE DROPLETS WITH NEGLIGIBLE BUOYANCY EFFECTS **c25**
X. Chesneau, C. Chauveau, and I. Goekalp *In* ESA, Fluids in Space Jun. 1992 p 407-418 Sponsored by ESA and CNRS (For primary document see N93-22830 08-29)
Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Experimental results concerning the envelope flame burning of n-heptane droplets with negligible buoyancy effects are presented. In order to deduce buoyancy, the parabolic flights of an aircraft are used to create a reduced gravity environment of the order of 0.01 g. The experiments are performed in a droplet burning facility specially designed for this purpose. The results presented give a clear experimental evidence of the nonsteady behavior of droplet burning whereas the spherical summary is conserved by showing essentially that the flame first moves away from the droplet, then back towards it, and that the ratio of flame to droplet diameter increases continuously during combustion. Results from experiments conducted in normal gravity by reduced pressure conditions are compared with low gravity results. Preliminary results on the influence of increasing pressure in drcplet burning in microgravity are presented. ESA

OSCILLATIONS OF FINITE LIQUID COLUMNS **c34**
Dieter Langbein *In* ESA, Fluids in Space Jun. 1992 p 419-442 (For primary document see N93-22830 08-29)
(Contract BMFT-QV-8920)
Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The resonance frequencies of cylindrical liquid bridges spanned between coaxial circular disks are investigated. The oscillations of infinite liquid columns are determined, which are periodic in time but damped in axial direction. For each frequency, an infinite set of such oscillations is obtained. Turning to finite columns, linear combinations of these axially damped oscillations are formed, which satisfy the boundary conditions in the flow velocity at the supporting disks. The resulting infinite sums are truncated by limiting satisfaction of the boundary conditions to a finite number of circles. The pressure exerted by the liquid column into the disks is calculated. The maxima at the resonance frequencies clearly decrease in sharpness and eventually vanish with increasing viscosity and decreasing surface tension of the liquid used. Simultaneously the phase of the pressure decreases from a value close to +pi/2 to a value close to -pi/2. The explicit dependence of the resonance frequencies on the aspect ratio between length and diameter of the liquid columns and their viscosity and surface tension is given. Off resonance, in particular at high frequencies, the length of the columns actually accelerated by the vibrating disk is found to correspond to 30 percent of their diameter. ESA

SURFACE TENSION AND BUOYANCY DRIVEN STOKES FLOW IN CAVITIES **c34**
L. G. Napolitano, A. Viviani, and D. Castagnolo *In* ESA, Fluids in Space Jun. 1992 p 443-480 (For primary document see N93-22830 08-29)
Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The motion driven by both surface tension gradients and buoyancy forces in liquids filling a cavity with differentially heated end walls is considered. Under the hypothesis of nondimensional transport numbers (Reynolds and Peclet) and very small capillary number, the field equations

are expanded in a series of successive linear approximations; the zeroth order is the Stokes problem, which is formulated in terms of the stream function and solved analytically via infinite series of the Papkovitch-Fadle complex biorthogonal functions. The solution for the zeroth order temperature, velocity and pressure fields and for the first order free surface shape were derived; since the convergence behavior of the Papkovitch-Fadle series is oscillatory, a convergence study was performed in order to evaluate the number of terms to be retained for a good accuracy. Stream lines, velocity profiles and free surface shapes are given for various aspect ratio of the cavity; in particular, the maximum surface velocity and the maximum free surface deformation are given as function of the aspect ratio. ESA

LASER SURFACE TREATMENT: NUMERICAL SIMULATION OF THERMOCAPILLARY FLOW AND FREE SURFACE DEFORMATION **c34**

F. D. Cipriani and A. Roux *In* ESA, Fluids in Space Jun. 1992 p 481-488 (For primary document see N93-22830 08-29)
Copyright Avail: CASI HC A02/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The numerical simulation of thermocapillary flows occurring in laser surface treatment is considered. A two dimensional rectangular cavity is used to model the molten pool which occurs when a laser beam impinges a material. The simulated free surface which is considered deformable (contact angles solid/liquid = 90 deg), is submitted to a sinusoidal temperature distribution (laser beam simulation). The Navier-Stokes and energy equations are solved by a finite element method. The influence of the aspect ratio of the cavity and the capillary number on the free surface shape is investigated. The numerical results are compared with an analytic solution. ESA

INVESTIGATION OF HOT WIRE ANEMOMETERS AT VERY LOW VELOCITIES UNDER MICROGRAVITY **c35**

F. R. Stengele, A. Delgado, and H. J. Rath *In* ESA, Fluids in Space Jun. 1992 p 489-500 Sponsored by BMFT (For primary document see N93-22830 08-29)
Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

A method of calibrating hot wire and hot film probes at very low velocities (Reynolds number greater than 0 and less than 1) under terrestrial conditions as well as under microgravity is reported. With the experimental set up it was possible to investigate all three flow regimes from natural through mixed to forced convection. The investigation showed a significant influence of the free convection for velocities less than 5 cm/s. ESA

Fundamentals of the reaction mechanism and details of experimental setups for parabolic flight and drop tower are presented. Research was focused on polyreactions and the influence of gravity on molecular weight, polymer dispersity, polymer tacticity, and particle size dispersity. The drop tower was also used to polymerize liquid monomers without containers to study the influence of wall effects on polymerization behavior. The setups were proven to be very suitable, but at the time of publishing they had not been completely evaluated. ESA

WETTING HYSTERESIS OF TIN ON SILICA SOLID SURFACES OF CONTROLLED PERIODIC ROUGHNESS **c34**

V. DeJonghe and D. Chatain *In* ESA, Fluids in Space Jun. 1992 p 525-532 Sponsored by CNES (For primary document see N93-22830 08-29)
(Grant B/BREU-900307-8)
Copyright Avail: CASI HC A02/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The wettability of a solid surface with controlled shape features is studied in a liquid Sn/vitreous SiO2 system at 1150 K. The topographical defects of the solid surface are cylinders which have a diameter of 60 micrometers. They are arranged in a hexagonal network which extend above the basal surface. The maximum wetting hysteresis, defined as the difference between the largest advancing and smallest receding contact angles, depends on neither the concentration (9 and 33 percent) nor the height of the defects (33 nm to 1 micrometer). It is measured by a 'compressed drop' method originally derived from the sessile drop method. In situ observations of the motion of the solid-liquid-vapor triple line using hot stage light microscopy show that this line is not pinned at the edge of the cylindrical defects, because the high curvature of the edge of the topographical features differs from the curvature of the triple line. In this case, contact angle hysteresis only depends on the mean roughness and/or heterogeneity of the surface parallel to the plane in which the triple line moves. ESA

EXPERIMENTAL INVESTIGATION OF THE INFLUENCE OF THE TEMPERATURE GRADIENT ON THE THERMOCAPILLARY CONVECTION IN SPHERICAL DROPS UNDER LOW-GRAVITY

U. Duda, J. A. Szymczyk, J. Siekmann, M. Treuner (Bremen Univ., Germany.), A. Delgado (Bremen Univ., Germany.), and H. J. Rath (Bremen Univ., Germany.) *In* ESA, Fluids in Space Jun. 1992 p 533-545 Sponsored by BMFT (For primary document see N93-22830 08-29)
Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The investigation of the thermocapillary convection within spherical drops under low gravity conditions using parabolic flight possibilities in a KC-135 aircraft is addressed. Formation and management of large sized drops up to 1 mm in diameter are described. Flow and temperature fields inside the drops were visualized simultaneously by using a white light sheet and liquid crystal tracers. The geometrical and optical setup and the measuring technique as well as evaluated flow data for the temperature and velocity field are demonstrated. ESA

HEAT TRANSFER SIMULATION WITH A CONDUCTIVE-RADIATIVE MODEL FOR PREDICTING THE SHAPE OF HgI2 CRYSTAL GROWN IN THE LTVG FURNACE **c76**

A. Roux and A. Fedoseyev (Academy of Sciences, USSR, Moscow.) *In* ESA, Fluids in Space Jun. 1992 p 547-552 (For primary document see N93-22830 08-29)
(Contract ESA-8431/89/F/BZ)
Copyright Avail: CASI HC A02/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The modeling of heat exchangers in a sealed ampoule in the LTVG furnace is considered in order to compute temperature fields and control the growth of HgI2 crystals from vapor phase at low temperatures. As a first step, a coupled conductive radiative model was used to determine the shape of the crystal at an equilibrium state (i.e., without growth rate). Only one case is considered, corresponding to the end of growth. The model involves conductivity anisotropy in the crystal and radiative exchanges

between grey and diffuse surfaces (source and crystal interfaces, pyrex walls), which are considered as opaque. Internal buoyancy effect is not taken into account as the pressure inside the ampoule is very small. The influence of the imposed boundary conditions, in particular along the pedestal and the cold finger regions which play a crucial role during the growth, was emphasized. The 'equilibrium' isotherm between the source/gas and crystal/gas interfaces, which is associated with the stop of the growing process, was numerically obtained. This 'equilibrium' isotherm gives the crystal shape, which is compared with previous experimental results. The model would permit a better understanding and control of the future HgI2 crystal growth experiment. The computations are performed using a finite element package. ESA

The linear stability of the equilibrium of a thin liquid layer lying on a flat wall was studied. Usually this stability depends upon gravity (Rayleigh-Taylor instability) but not upon wall distance or wetting properties. Using the Cahn and Hilliard model for multiphase fluid, it was shown that the influence of the wall decreases exponentially with the layer thickness and is all the more important as the gravity is weak and the fluid is close to the critical point. Theoretical results about the interplay between thermocapillary (Marangoni) instability and a magnetic field under terrestrial and microgravity conditions are presented. A comprehensive treatment is reported of Marangoni instability in an unbounded layer of fluid with a free upper surface. Surface deformation is taken into account. A homogeneous magnetic field acting perpendicular to the free surface gives rise to a postponement of the onset of the instability. If the layer is heated from below, the instability is purely exponentially growing. A fluid layer heated from above becomes unstable with respect to oscillatory perturbations. A comparison between the thresholds of stationary and oscillatory Marangoni instabilities show that the latter is more sensitive to the application of the magnetic field. A qualitative discussion of the instability in a horizontal magnetic field indicates a selective suppression of instability depending upon the orientation of the roll cells to the direction of the magnetic field. THERMAL GRAVITATIONAL MODELLING AND SCALING OF TWO-PHASE HEAT TRANSPORT SYSTEMS: SIMILARITY CONSIDERATIONS AND USEFUL EQUATIONS, PREDICTIONS VERSUS EXPERIMENTAL RESULTS
A. A. M. Delil *In* ESA, Fluids in Space Jun. 1992 p 579-599 (For primary document see N93-22830 08-29)
Copyright Avail: CASI HC A03/MF A06; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Various aspects of thermal gravitational scaling of spacecraft two phase heat transport systems are reviewed. Supporting similarity considerations, based on dimension analysis, and useful equations and correlations are given. The assessment of the applicability (validity and restrictions) of modeling and scaling approach is supported by a comparison of two phase flow pressure drops measured under low gravity conditions and modeling predictions. Terrestrial scaling experiments with ammonia test rig are identified for the support of the development of the ESA capillary pumped Two Phase ammonia experiment (TPX) in Get Away Special G-557 and the development of the mechanically pumped ESA R114 Two Phase Heat Transport System (TPHTS). STABILITY AND INSTABILITY OF THERMOCAPILLARY CONVECTION IN MODELS OF THE FLOAT-ZONE CRYSTAL-GROWTH PROCESS Final Report, 2 May 1989 - 31 Oct. 1992
G. P. Neitzel Mar. 1993 11 p
(Grant NAG3-1221)
(NASA-CR-192695; NAS 1.26:192695) Avail: CASI HC A03/MF A01

This project was concerned with the determination of conditions of guaranteed stability and instability for thermocapillary convection in a model of the float-zone crystal-growth process. This model, referred to as the half-zone, was studied extensively, both experimentally and theoretically. Our own earlier research determined, using energy-stability theory, sufficient conditions for stability to axisymmetric disturbances. Nearly all results computed were for the case of a liquid with Prandtl Number Pr = 1. Attempts to compute cases for higher Prandtl numbers to allow comparison with the experimental results of other researchers were unsuccessful, but indicated that the condition guaranteeing stability against axisymmetric disturbances would be a value of the Marangoni number (Ma), significantly higher than that at which oscillatory convection was observed experimentally. Thus, additional results were needed to round out the stability picture for this model problem. The research performed under this grant consisted of the following: (1) computation of energy-stability limits for non-axisymmetric disturbances; (2) computation of linear-stability limits for axisymmetric and non-axisymmetric disturbances; (3) numerical simulation of the basic state for half- and full-zones with a deformable free surface; and (4) incorporation of radiation heat transfer into a model energy-stability problem. Each of these is summarized briefly below. Derived from text

MATERIALS SCIENCE ON PARABOLIC AIRCRAFT: THE FY 1987-1989 KC-135 MICROGRAVITY TEST PROGRAM
Peter A. Curreri, ed. Mar. 1993 143 p
(NASA-TM-4456; M-713; NAS 1.15:4456) Avail: CASI HC A07/MF A02

This document covers research results from the KC-135 Materials Science Program managed by MSFC for the period FY87 through FY89. It follows the previous NASA Technical Memorandum for FY84-86 published in August 1988. This volume contains over 30 reports grouped into eight subject areas covering acceleration levels, space flight hardware, transport and interfacial studies, thermodynamics, containerless processing, welding, melt/crucible interactions, and directional solidification. The KC-135 materials science experiments during FY87-89 accomplished direct science, preparation for space flight experiments, and justification for new experiments in orbit. Author

DROPLET COMBUSTION CHARACTERISTICS UNDER MICROGRAVITY AND NORMAL-GRAVITY CONDITIONS Ph.D. Thesis
Mun Young Choi 1992 304 p
Avail: Univ. Microfilms Order No. DA9230621

This dissertation examines the effects of relative droplet/gas motion, soot and sootshell formation, intermediate and product absorption and the substitution of various inert (N2, He, Ar) gases on the overall burning characteristic of isolated droplets including quasi-steady and transient combustion. Microgravity experimental results indicate that quiescent burning rates for isolated n-heptane droplets (in air) are substantially lower than the values previously reported by various investigators. Experiments (conducted under normal-gravity and microgravity conditions) have demonstrated that the sooting propensity of n-alkane fuel droplets can be varied through diluent-substitution, oxygen-index variations and ambient pressure reductions. A transient droplet combustion model (CRFM) was used to gain phenomenological insights into the dynamics of sootshell formation. By incorporating empirical scaling corrections that account for observed reductions in droplet burning rate and flame standoff distance due to soot/sootshell formation effects, the quantitative agreement was improved --the modeling predictions of the soot standoff ratio were within 10 percent of measured values. Normal-gravity (earth-gravity) methanol

combustion experiments have revealed a substantial degree of water absorption during the combustion of methanol, which can modify both the burning rate and the extinction process. Small levels (100's ppm) of formaldehyde were also detected. These experiments substantiate that certain single-component fuels can display multi-component burning characteristics. However, similar experiments for n-alkane fuels indicate that the degree of product and intermediate absorption is negligible. The substitution of O2/HNe environments for O2/N2 environments produced substantially higher burning rates and larger extinction diameters for methanol droplets. Utilizing a 50 percent O2/He environment at 1 atmosphere, the first well-characterized extinction measurements were obtained. This dissertation also demonstrates a rapid and accurate computer-based, image processing method for the analysis of the photographic records from the microgravity and normal-gravity experiments. An alternative technique of producing reduced-gravity conditions to study freely-falling droplets of less than 500 micron diameter is proposed. The unique feature of this experiment is that cold gas flow will be used to simplify the geometry of the tube needed to accelerate the co-flowing gas to match the acceleration of the freely-falling droplets. Dissert. Abstr.

MICROGRAVITY SCIENCE AND APPLICATIONS: PROGRAM TASKS AND BIBLIOGRAPHY FOR FY 1992

Mar. 1993 366 p

(NASA-TM-4469; NAS 1.15:4469) Avail: CASI HC A16/MF A03

This report is a compilation of the FY 1992 Principal Investigator program task descriptions funded by the Microgravity Science and Applications Division (MSAD), NASA Headquarters, Washington, DC. The document also provides a bibliography of FY 1992 publications and presentations cited by MSAD Principal Investigators, and an index of the Principal Investigators and their affiliations. The purpose of the document is to provide an overview and progress report for the funded tasks for scientists and researchers in industry, university, and government communities. The tasks are grouped into three categories appropriate to the type of research being done-space flight, ground based, and advanced technology development-and by science discipline. The science disciplines are: biotechnology, combustion science,, electronic materials, fluid physics, fundamental physics, glass and ceramics, metals and alloys, and protein crystal growth. Author

Repulsion forces arising from laser beams are provided to produce mild positioning forces on a sample in microgravity vacuum environments. The system of the preferred embodiment positions samples using a plurality of pulsed lasers providing opposing repulsion forces. The lasers are positioned around the periphery of a confinement area and expanded to create a confinement zone. The grouped laser configuration, in coordination with position sensing devices, creates a feedback servo whereby stable position control of a sample within microgravity environment can be achieved.

The ERASE program has been for many years a principle source of advanced research and development work within the U.S. Department of Defense in support of the lethal defense suppression warfare mission area. Projects conducted at the U.S. Naval Weapons Center, China Lake, California (now part of the U.S. Naval Air Warfare Center), under the ERASE program, have been remarkably successful in both discovering and proving new technologies needed in lethal defense suppression, and in working with industry to transition this technology to fleet weapons prepared to support U.S. and NATO forces. British Aerospace (Systems & Equipment) Ltd (BASE) has been working in the field of automatic electro-optical tracking (Autotrack) systems for more than 12 years. BASE Autotrack systems carry out the automatic detection, tracking and classification of missiles and targets using image processing techniques operating on data received from electro-optical sensors. Typical systems also produce control data to move the sensor platform, enabling moving targets to be tracked accurately over a wide range of conditions. BASE Autotrack systems have been well proven in land, sea and air applications. This paper discusses the relevance of Autotrack systems to modern high-technology warfare and charts the progress of their development within BASE, both with respect to current products and active research programs. Two third generation BASE Autotrack systems are described, one of which provided a sophisticated air-to-ground tracking capability in the recent Gulf War. The latest Autotrack product is also described; this uses ASIC and Transputer technology to provide a high-performance, compact, missile and target tracker. Reference is also made to BASE's research work. Topics include an ASIC correlator, point target detection and, in particular, the use of neural networks for real-time target classification. Author

Several motion sensors of novel design have been developed during the past decade with the guided weapon or projectile market as the target user. In addition to technical performance requirements, all such sensors must be very robust with small size and mass, low power consumption and low cost. START is an angular rate sensor developed for this purpose. However, the guided munitions market has been very slow to evolve and new applications were sought in which the characteristics listed above, plus a very long operating and shelf life could be exploited. The field of image stabilization seemed promising and applications for use were followed up. The paper describes the characteristics of START which make it suited to this field and discusses some of the specific applications and the results achieved in tests of these equipments. Author

Image registration is an important preprocessing step often used in applications, such as automatic target tracking, to decouple image motion from target motion. This paper presents an image registration algorithm designed for a real-time implementation on platforms such as precision guided weapons. The algorithm uses a set of small optimal windows to register successive images from a video sequence. The windows are tracked over time and assessed for their quality in providing a good and persistent registration measure. Areas selected over moving objects are also detected and replaced. The image motion vectors obtained from each window are used to estimate the image motion correction. Evaluation of the performance of the algorithm in critical areas, such as its expected registration accuracy and its tolerance to image deformation caused by rotation, are presented. Results are presented when the algorithm is applied, in conjunction with a motion tracker, to the detection and tracking of targets in video sequences acquired from moving platforms and presenting difficulties of partial occlusion, high background clutter and low target-to-background contrast. The registration algorithm has demonstrated properties of robustness and computational efficiency that are of interest for guided weapons applications. The limitations of the method are also discussed. Author

The Missile-Borne Integrated Neural Network Demonstration (MINND) Program is a Navy 6.3A Advanced Technology Demonstration program, with the goal of demonstrating the application of artificial neural network technology to improving the performance of IR seekers. The specific technical objective is to demonstrate the realtime detection of moving point targets in IR clutter. The program has developed neural network-based system design in several stages of increasing capability for moving target detection. The program has developed several stages of hardware, supporting neural chip testing/learning, followed by realtime processing hardware for implementation of software designs. MINND is currently in its final phase of integrated demonstration testing using real sensor inputs. Author

MULTIVARIABLE FREQUENCY RESPONSE METHODS FOR OPTIMAL KALMAN-BUCY FILTERS WITH APPLICATIONS TO RADAR TRACKING SYSTEMS **c32**

C. C. Arcasoy *In* AGARD, Advances in Guidance and Control of Precision Guided Weapons Nov. 1992 14 p (For primary document see N93-22018 08-31)

Copyright Avail: CASI HC A03/MF A02

The problem of multi-output, infinite-time, linear time-invariant optimal Kalman-Bucy filter both in continuous and discrete-time cases in frequency domain is addressed. A simple new algorithm is given for the analytical solution to the steady-state gain of the optimum filter based on a transfer function approach. The algorithm is based on spectral factorization of observed spectral density matrix of the filter which generates directly the return-difference matrix of the optimal filter. The method is more direct than by algebraic Riccati equation solution and can easily be implemented on digital computer. The design procedure is illustrated by examples and closed-form solution of ECV and ECA radar tracking filters are considered as an application of the method. Author

SYSTEM EVALUATION OF A FIBER OPTIC GUIDED MISSILE WITH A SIMPLE GUIDANCE ADDITION TO IMPROVE SYSTEM EFFECTIVENESS **c74**

A. J. Krabbendam *In* AGARD, Advances in Guidance and Control of Precision Guided Weapons Nov. 1992 12 p (For primary document see N93-22018 08-31)

Copyright Avail: CASI HC A03/MF A02

Based on lessons learned during the accomplishment of a National Technology Project in the Netherlands, a simple and low cost Fiber Optic Guided Weapon (FOGW) concept was contrived. The main characteristics of the concept are the short range of 10 km, the simple strapdown television CCD-camera, and the solid fuel rocket propulsion. This low cost concept is more closely examined. The concept was evaluated by conducting flight trajectory simulations. An already existing six degrees of freedom (6-DOF) trajectory simulation program was modified. The program and especially the relatively simple target sensor system model are described. The problem of choosing an appropriate target configuration for system evaluation is attended to. A target configuration consists of various target positions, various target maneuvers, and various target speeds. The probability of hit is calculated for a chosen target configuration base-case. Miscellaneous model parameters are varied, especially the target sensor system is investigated. The probability of hit is determined as a function of the sensor resolution, the sensor field of view, and the modeled characteristics of the image processing algorithm. Another investigation concerns a simple addition to the normal guidance commands trying to reduce target-lost situations. The effect of two different implementations of this addition is calculated for the same situation as the basic guidance configuration. Author (revised)

LINEAR PAYOUT SYSTEMS FOR DISPENSING FIBER-OPTIC DATA LINKS FROM PRECISION-GUIDED MUNITIONS OR HIGH-PERFORMANCE AIRCRAFT/MISSLES **c74**

F. Hoban and D. Harms *In* AGARD, Advances in Guidance and Control of Precision Guided Weapons Nov. 1992 5 p (For primary document see N93-22018 08-31)

Copyright Avail: CASI HC A01/MF A02

Theoretical studies and empirical tests were conducted as part of the development and demonstration of a fiber-optic data link for weapon system guidance and control. These studies characterized the performance capability of several unique payout system concepts that permit the dispensing of a small diameter (170- to 250-micrometer) fiber-optic data link from military weapon systems at high subsonic velocities. Theoretical predictions were compared with laboratory payout test results. Several engineering models that allow linear dispensing of the fiber from a fiber canister or spool were developed and tested. Material, mechanical, and physical concepts evaluated included spiral flow of air through a payout nozzle, rotating nozzles with fixed geometries, fiber adhesives, and mechanical vibrations. Fiber real-time payout tension loads were measured for several fiber diameters and adhesives. Excellent results were obtained with a silicon-based adhesive

with a low coefficient of friction and a 170-micrometer-diameter fiber. The prototype tests verified the results predicted by the theoretical string dynamical models. Author

VERSATILE ATTACK WEAPON

D. Quist *In* AGARD, Advances in Guidance and Control of Precision Guided Weapons Nov. 1992 4 p (For primary document see N93-22018 08-31)

Copyright Avail: CASI HC A01/MF A02

The air defense threat to air strike forces continues to increase, both in quality and quantity. Third World countries now possess Integrated Air Defense (AID) capabilities equaling that of major powers. Radio Frequency (RF) only Anti-Radiation Homing (ARH) weapons are being effectively neutralized by countermeasure improvements in these land based and satellite IAD systems. The cost of piecemeal modification of existing weapon systems or the continuous fielding of threat specific weapon systems is becoming prohibitive. A low funded in-house project was started in 1988 that confronts this defense threat situation with a multi-mode multi-mission weapon system which is affordable to employ in large quantities. The system has capabilities as both a defense suppression weapon and a surgical strike weapon. Employment can be facilitated from a reduced threat environment to air strike forces. Other objectives for this innovative weapon system are the capabilities for high target damage, countermeasure resistance, real time aim point selection, and real time Battle Damage Assessment (BDA). Technical feasibility of the various system and subsystem elements were verified by theoretical analysis. Many were also verified by physical demonstration in prototype hardware. Author (revised)

Last year, Dornier, a company of Deutsche Aerospace (DASA, Deutsche Aerospace AG) successfully completed flight tests with an experimental standoff dispenser, called ADW. ADW is the abbreviation of the German words for 'Standoff Dispenser Weapon' (ADW, Abstands Dispenser Waffe). The ADW test vehicle is an autonomous guided, non-powered missile with high navigation accuracy. It is used for in-flight ejection tests with different types of submunitions. It is equipped with an INS (Inertial Navigation System) updated by GPS (Global Positioning System) in order to guarantee a precise target approach. Author (revised)

SYSTEM CONCEPT FOR AN ADVANCED STAND-OFF WEAPON

Riccardo Barzan *In* AGARD, Advances in Guidance and Control of Precision Guided Weapons Nov. 1992 8 p (For primary document see N93-22018 08-31)

Copyright Avail: CASI HC A02/MF A02

A typical conceptual design process is described as applicable to an advanced Stand Off Weapon (SOW). Different design requirement sets, which include system performance parameters, are established to satisfy different mission requirements. In order to cope with these sets and to reach the flexibility needed, some specific design criteria are suggested. The trade between modularity and commonality makes the difference among different SOW's and affects them in affordability and effectiveness. The Skyshark weapon system is given as example of an SOW system concept. The description allows the understanding of links between design requirements, design criteria, and technical characteristics. Extensive modularity is adopted for all components that enhance flexibility (Armament, Avionics, Propulsion), while a favorable configuration layout choice allows maximizing commonality. This paper presents an industrial point of view and is related to almost 10 years of Alenia activities on Stand Off Weapons. Author (revised)

RADAR SEEKER BASED AUTONOMOUS NAVIGATION UPDATE SYSTEM USING TOPOGRAPHY FEATURE MATCHING TECHNIQUES **c32**

H. D. Lerche and F. Tumbreagel *In* AGARD, Advances in Guidance and Control of Precision Guided Weapons Nov. 1992 13 p (For primary document see N93-22018 08-31)

Copyright Avail: CASI HC A03/MF A02

The discussed navigation update system was designed for an unmanned platform with fire and forget capability. It meets the requirement due to fully autonomous operation. The system concept will be characterized by complementary use of the radar seeker for target identification as well as for navigation function. The system works in the navigation mode during preprogrammable phases where the primary target identification function is not active or in parallel processing. The dual function radar seeker system navigates the drone during the midcourse and terminal phases of the mission. Its high resolution due to range measurement and doppler beam sharpening in context with its radar reflectivity sensing capability are the basis for topography referenced navigation computation. The detected height jumps (coming from terrain elevation and cultural objects) and radar reflectivity features will be matched together with topography referenced features. The database comprises elevation data and selected radar reflectivity features that are robust against seasonal influences. The operational benefits of the discussed system are as follows: (1) the improved navigation performance with high probability of position fixing, even over flat terrain; (2) the operation within higher altitudes; and (3) bad weather capability. The developed software modules were verified with captive flight test data running in a hardware-in-the-loop simulation. Author (revised)

METHOD AND APPARATUS FOR CLEANING RUBBER DEPOSITS FROM AIRPORT RUNWAYS AND ROADWAYS Patent

Sandy M. Stubbs, inventor (to NASA) 6 Apr. 1993 5 p Filed 3 Apr. 1991 Supersedes N91-28455 (29 - 20, p 3332)

(NASA-Case-LAR-14483-1; US-Patent-5,199,128; US-Patent-Appl-SN-682153; US-Patent-Class-15-52; US-Patent-Class-15-80; US-Patent-Class-15-87; Int-Patent-Class-A47L-11/282) Avail: US Patent and Trademark Office

A method and apparatus for cleaning rubber deposits from surfaces such as airport runways and roadways is disclosed. The apparatus includes a large vehicle that has the capacity to be loaded so as to effectively add weight to the rubber cleaning tires of the vehicle. In addition, the vehicle has a water tank and sprinkler system so that the surface may be wetted down in front of the tires as the vehicle proceeds across the surface. The cleaning tires of the apparatus are aligned so that they are at a yaw angle to the direction of travel, and the cleaning tire assembly is attached to the underside of the trailer of the vehicle and positioned between a forward and rear water tank. In addition, this tire assembly is equipped with a means of loading the tires onto the contaminated surface. The method comprises driving such a vehicle at low speeds down the surface as the road is being wet in front of the cleaning tires. The effect of the angled tires is to create a scrubbing action that not only heats the rubber deposits by friction but also causes it to be removed from the surface. The rubber that does not stick to the cleaning tires is then removed from the surface by sweeping. Official Gazette of the U.S. Patent and Trademark Office

A COMPARISON OF NATIONAL STANDARDS FOR THE PERFORMANCE EVALUATION OF COORDINATE MEASURING MACHINES IN TERMS OF LENGTH-BASED DIMENSIONAL QUANTITIES

Dennis A. Swyt Nov. 1992 15 p

(PB93-139004; NISTIR-4978) Avail: CASI HC A03/MF A01

U.S., German, British, and Japanese standards for evaluation of coordinate measuring machines are compared and it is shown that using a variety of special artifacts the U.S. standard alone specifies separate tests for each of the four modes of length measurements (displacement, position, distance, and extension) and that, depending on the number and orientations of faces probed, a bi-directional step gage of the type suggested in the

other standards can be used for tests of each of these four modes.

PS1 SATELLITE REFRIGERATOR HEAT EXCHANGER: FAILURE OF THE LN2 HEAT EXCHANGER TO LOW PRESSURE HELIUM
B. Squires Nov. 1992 17 p
(Contract DE-AC02-76CH-03000)
(DE93-005616; FNAL-TM-1811) Avail: CASI HC A03/MF A01

The PS1 heat exchanger is one of three prototype heat exchangers built in support of a contract for Satellite Refrigerator Heat Exchanger components. This heat exchanger was first put into operation in Jul. 1983. In Nov. 1991, this heat exchanger experienced a failure in the shell of heat exchanger 1 causing nitrogen to contaminate the helium in the refrigerator. The resulting contamination plugged heat exchanger 3. The break occurred at a weld that connects a 0.25 inch thick ring to heat exchanger 1. The failure appears to be a fatigue of the shell due to temperature oscillations. The flow rate through the break was measured to be 1.0 scfm for a pressure drop over the crack of 50 psi. An ANSYS analysis of the failure area indicates that the stress would be 83,000 psi if the metal did not yield. This is based on cooling down the shell to 80K from 300K with the shell side helium on the outside of the shell at 300K. This is the largest change in temperature that occurs during operation. During normal operations, the temperature swings are not nearly this large, however temperatures down to 80K are not unusual (LN2 overflowing pot). The highest temperatures are typically 260K. The analysis makes no attempt to estimate the stress concentration factor at this weld, but there is no doubt that it is greater than 1. No estimate as to the number of cycles to cause failure was calculated nor any estimate as to the actual number of cycles was made. DOE

A DISTRIBUTED VISUALIZATION ENVIRONMENT FOR ENGINEERING SCIENCES
C. J. Pavlakos, L. A. Schoof, and J. F. Mareda Dec. 1992 9 p
(Contract DE-AC04-76DP-00789)
(DE93-006961; SAND-92-0778) Avail: CASI HC A02/MF A01

In this paper, we characterize a visualization environment that has been designed and prototyped for a large community of scientists and engineers. The proposed environment makes use of a visualization server concept to provide effective, interactive visualization to the user's desktop. Benefits of using the visualization server approach are discussed. Some thoughts regarding desirable features for visualization server hardware architectures are also addressed. A brief discussion of the software environment is included. The paper concludes by summarizing certain observations which we have made regarding the implementation of such visualization environments. ANALYSIS OF UPWARD FLAME SPREAD
Djebar Baroudi and Matti Kokkala 1992 50 p
(DE93-752850; VTT-PUB-89) Avail: CASI HC A03/MF A01

Upward flame spread on wall linings is analyzed theoretically with special emphasis on the application of the models to predict whether the flame spread will be deceleratory or acceleratory. Much of the work is devoted to a revised application of the model by Saito et al. By applying various analytical expressions for the rate of heat release, quantitative expressions for the flame spread velocity are derived. Criteria for accelerating flame spread are presented. Due to the lack of large-scale flame spread tests, the predictions are compared with material data and room fire test results in Swedish BRANDFORSK test series on wall lining materials and in the EUREFIC program. SNEAK ANALYSIS APPLIED TO PROCESS SYSTEMS
Cris Whetton (Sheffield Univ., England.) 1992 96 p
(DE93-752866; VTT-TIED-1376) Avail: CASI HC A05/MF A01

Traditional safety analyses, such as HAZOP, FMEA, FTA, and MORT, are less than effective at identifying hazards resulting from incorrect 'flow' - whether this be flow of information, actions, electric current, or even the literal flow of process fluids. Sneak Analysis (SA) has existed since the mid nineteen-seventies as a means of identifying such conditions in electric circuits; in which area, it is usually known as Sneak Circuit Analysis (SCA). This paper extends the ideas of Sneak Circuit Analysis to a general method of Sneak Analysis applied to process plant. The methods of SA attempt to capitalize on previous work in the electrical field by first producing a pseudo-electrical analog of the process and then analyzing the analog by the existing techniques of SCA, supplemented by some additional rules and clues specific to processes. The SA method is not intended to replace any existing method of safety analysis; instead, it is intended to supplement such techniques as HAZOP and FMEA by providing systematic procedures for the identification of a class of potential problems which are not well covered by any other method. FY 1991 SAFETY PROGRAM STATUS REPORT
1991 38 p
(NASA-TM-108707; NAS 1.15:108707) Avail: CASI HC A03/MF A01

In FY 1991, the NASA Safety Division continued efforts to enhance the quality and productivity of its safety oversight function. Recent initiatives set forth in areas such as training, risk management, safety assurance, operational safety, and safety information systems have matured into viable programs contributing to the safety and success of activities throughout the Agency. Efforts continued to develop a centralized intra-agency safety training program with establishment of the NASA Safety Training Center at the Johnson Space Center (JSC). The objective is to provide quality training for NASA employees and contractors on a broad range of safety-related topics. Courses developed by the Training Center will be presented at various NASA locations to minimize travel and reach the greatest number of people at the least cost. In FY 1991, as part of the ongoing efforts to enhance the total quality of NASA's safety work force, the Safety Training Center initiated development of a Certified Safety Professional review course. This course provides a comprehensive review of the skills and knowledge

that well-rounded safety professionals must possess to qualify for professional certification. FY 1992 will see the course presented to NASA and contractor employees at all installations via the NASA Video Teleconference System. Derived from text

AN EVALUATION OF MAGNETIC REFRIGERATION CYCLES BASED ON HOW EFFECTIVELY THE THERMAL PROPERTIES OF THE REFRIGERANT ARE UTILIZED Ph.D. Thesis
Duane Paul Siemens 1992 105 p
Avail: Univ. Microfilms Order No. DA9232861

In an effort to show that the magnetothermal properties of a material can be varied in a manner useful for magnetic refrigeration, Gd doped EuS has been synthesized using an arc melting technique and its magnetic heat capacity measured. The heat capacity data shows little change from pure EuS, probably due to compensation of the donor clectrons caused by inhomogeneous doping. Analysis of the data in terms of its refrigerant capacity and comparison to mean field calculations indicate that EuS is a more effective refrigerant in the 4-35 K region than Gd3Ga5O12 and that for applied fields below 1 Tesla the effects of domains and irreversibilities may be relatively more significant than at higher fields. Also a figure of merit has been developed to evaluate the effort required, due to the intrinsic properties of the materials, to implement a given refrigeration cycle. On the basis of this figure of merit a simple scaling argument indicates that a refrigeration cycle using active magnetic regeneration would be better than a single stage, passively regenerated cycle when the temperature span is greater than the heat source temperature. In addition, an analysis of an idealized Ericsson cycle using active magnetic regeneration is made and a technique to match the fixed temperature ends to the regenerator temperature variation is developed that shows qualitative new features not previously recognized. Dissert. Abstr.

NASA METRIC TRANSITION PLAN
1992 39 p
(NASA-TM-108606; NAS 1.15:108606) Avail: CASI HC A03/MF A01

NASA science publications have used the metric system of measurement since 1970. Although NASA has maintained a metric use policy since 1979, practical constraints have restricted actual use of metric units. In 1988, an amendment to the Metric Conversion Act of 1975 required the Federal Government to adopt the metric system except where impractical. In response to Public Law 100-418 and Executive Order 12770, NASA revised its metric use policy and developed this Metric Transition Plan. NASA's goal is to use the metric system for program development and functional support activities to the greatest practical extent by the end of 1995. The introduction of the metric system into new flight programs will determine the pace of the metric transition. Transition of institutional capabilities and support functions will be phased to enable use of the metric system in flight program development and operations. Externally oriented elements of this plan will introduce and actively support use of the metric system in education, public information, and small business programs. The plan also establishes a procedure for evaluating and approving waivers and exceptions to the required use of the metric system for new programs. Coordination with other Federal agencies and departments (through the Interagency Council on Metric Policy) and industry (directly and through professional societies and interest groups) will identify sources of external support and minimize duplication of effort. COMPARISON OF FULL SCALE FIRE TESTS AND A COMPUTER FIRE MODEL OF SEVERAL SMOKE EJECTION EXPERIMENTS
Emil Braun, Darren L. Lowe, Walter W. Jones, Patricia Tatem, Richard Carey, and Jean Bailey Nov. 1992 44 p Sponsored by Naval Research Lab. Prepared in cooperations with David Taylor Research Center, Annapolis, MD
(PB93-139087; NISTIR-4961) Avail: CASI HC A03/MF A01

Data were obtained from four large scale shipboard fire tests. The test series was designed to evaluate the efficacy of a smoke ejection system for the removal of smoke and heat from compartments around the compartment of fire origin. Using diesel oil and polyethylene beads as fuel, tests were conducted at 0.5 MW. GRA

FEDERAL MOVE TO METRIC: PUBLIC LAW, DOC AND NIST
Dennis A. Swyt Dec. 1992 14 p
(PB93-139129; NISTIR-4761) Avail: CASI HC A03/MF A01

Since its initial development, the metric system of measurement has evolved to become the modern International System of Units (SI) and has been formally accepted by all the nations of the world save three and all the industralized nations save one, the United States. Recently, Congress passed the Metric Usage Act of 1988, requiring all Federal agencies, including the National Institute of Standards and Technology, to plan and implement conversion to use of metric in their business-related activities and assigned responsibility for coordination of Federal agency conversion to the Department of Commerce. This paper reviews briefly the Federal legislative history of metric use in the U.S., metric practice associated with the modernized system, and the policies and plans of the Federal government in its legislatively-mandated conversion to use of that system. EVALUATION OF KAPTON PYROLYSIS, ARC TRACKING, AND FLASHOVER ON SiO(x)-COATED POLYIMIDE INSULATED SAMPLES OF FLAT FLEXIBLE CURRENT CARRIERS FOR SPACE STATION FREEDOM
Thomas J. Stueber and Chris Mundson (Cleveland State Univ., OH.) Apr. 1993 11 p
(Contract NAS3-25266; RTOP 474-46-10)
(NASA-CR-191106; E-7706; NAS 1.26:191106) Avail: CASI HC A03/MF A01

Kapton polyimide wiring insulation was found to be vulnerable to pyrolization, arc tracking, and flashover when momentary short-circuit arcs have occurred on aircraft power systems. Short-circuit arcs between wire pairs can pyrolize the polyimide resulting in a conductive char between conductors that may sustain the arc (arc tracking). Furthermore, the arc tracking may spread (flashover) to other wire pairs within a wire bundle. Polyimide Kapton will also be used as the insulating material for the flexible current carrier (FCC) of Space Station Freedom (SSF). The FCC, with conductors in a planar type geometric layout as opposed to bundles, is known to sustain arc tracking at proposed SSF power levels. Tests were conducted in a vacuum bell jar that was designed to conduct polyimide pyrolysis, arc tracking, and flashover studies on samples of SSF's FCC. Test results will be reported concerning the minimal power level needed to sustain arc tracking and the FCC susceptibility to flashover. Results of the FCC arc tracking tests indicate that only 22 volt amps were necessary to sustain arc tracking (proposed SSF power level is 400 watts). FCC flashover studies indicate that the flashover event is highly unlikely.

SMOKE MOVEMENT IN A CORRIDOR-HYBRID MODEL, SIMPLE MODEL, AND COMPARISON WITH EXPERIMENTS

Takayuki Matsushita and John H. Klote Dec. 1992 53 p

(PB93-146678; NISTIR-4982) Avail: CASI HC A04/MF A01

A hybrid model for simulating smoke movement in a corridor is described. This model uses a two zone approach which considers velocities in each zone, and uses a fine mesh in the direction of propagation. Two different approaches to deal with the pressure term are addressed. Full scale and reduced scale experiments are described and compared with the results of the hybrid model. Since heat transfer is not presently incorporated in the hybrid model, the simulated velocity of spread is constant. But in the experiment, the velocity drops with advancing time. A simple model with heat transfer is also described. This model is similar to the density flow model, and assumes that the movement of the smoke front (nose) is similar to the flow through vertical openings in a zone model. Results of the simple model are compared with the experiment with heat transfer, and the effect of the heat transfer coefficient is observed. GRA

CYCLE O(CY1991) NLS TRADE STUDIES AND ANALYSES REPORT. BOOK 2, PART 2: PROPULSION Report, May 1991 - Jan. 1992

R. Cronin, M. Werner, S. Bonson, R. Spring, and R. Houston Jan. 1992 281 p

(Contract NAS8-37143)

(NASA-CR-184472; NAS 1.26:184472; MMC-NLS-SR.001-Bk-2-Pt-2) Avail: CASI HC A13/MF A03

This report documents the propulsion system tasks performed in support of the National Launch System (NLS) Cycle O preliminary design activities. The report includes trades and analyses covering the following subjects: (1) Maximum Tank Stretch Study; (2) No LOX Bleed Performance Analysis; (3) LOX Bleed Trade Study; (4) LO2 Tank Pressure Limits; (5) LOX Tank Pressurization System Using Helium; (6) Space Transportation Main Engine (STME) Heat Exchanger Performance; (7) LH2 Passive Recirculation Performance Analysis; (8) LH2 Bleed/Recirculation Study; (9) LH2 Tank Pressure Limits; and (10) LH2 Pressurization System. For each trade study an executive summary and a detailed trade study are provided. For the convenience of the reader, a separate section containing a compilation of only the executive summaries is also provided. Author

PENETRATION MECHANICS RESEARCH IN THE FORMER SOVIET UNION

W. M. Isbell, C. E. Anderson, J. R. Asay, S. J. Bless, and D. E. Grady Sep. 1992 251 p

(PB93-146488) Avail: CASI HC A12/MF A03

Recently published papers by scientists from the former Soviet Union reveal to Western researchers a mature body of highly inventive and dedicated research. To analyze and assess this work, a group of six internationally recognized U.S. experts in the field of penetration mechanics and hypervelocity impact reviewed hundreds of unclassified documents. Five broad, sometimes overlapping, research areas were chosen for assessment: hypervelocity impact capabilities; penetration mechanics experiments at ordnance velocities; analytical penetration mechanics; material response to high-velocity impact and penetration; and numerical simulations of penetration physics. Both similarities and differences between Soviet and Western research were noted and characterized, with particular attention paid to potential breakthrough technologies. Leading Soviet scientists and their organizations were identified, as were areas of potentially fruitful collaboration between researchers from the former Soviet Union and the United States. Soviet breakthroughs in penetration mechanics technology that far out-distanced Western efforts were not found, though potential breakthroughs were noted in several areas, including penetration models of brittle materials (principally ceramics), superdeep penetration of particles, and very-high-velocity electromagnetic launchers. USER'S GUIDE TO FLEXIBLE MEMBRANE LINER ADVISORY EXPERT SYSTEM, FLEX VERSION 3.0

T. Adams and J. McCready Dec. 1992 32 p Sponsored by EPA

(Contract EPA-68-WO-0043)

(PB93-134872; EPA/600/C-92/006; EPA/SW/DK-93/029A) Avail: CASI HC A03/MF A01

The guide is a user manual for the Flexible Membrane Liner Advisory Expert System (FLEX). The system assists in determining if a proposed synthetic liner material will be chemically resistant to a proposed or anticipated leachate from a hazardous waste land disposal site. More specifically, it analyzes EPA required physical property test data (Method 9090) and provides textual advice about data adequacy and specific indicators that a liner may not be chemically resistant. ADVANCED INSULATIONS FOR REFRIGERATOR/FREEZERS: THE POTENTIAL FOR NEW SHELL DESIGN INCORPORATING POLYMER BARRIER CONSTRUCTION Final Report, Aug. 1991 - Nov. 1992

B. Griffith and D. Arasteh Jan. 1993 36 p Sponsored by EPA

(PB93-146991; EPA/600/R-93/009) Avail: CASI HC A03/MF A01

The report examines domestic refrigerator/freezer (R/F) design alternatives which may offer greater increase in thermal performance than is possible with panel/foam composites. (NOTE: Current efforts to design and build R/Fs with high performance insulation technology are directed at using vacuum panels in a composite with polymer foam to improve performance; however, certain restrictions generally enable only relatively small improvement in thermal resistance using these techniques.) These design alternatives involve basic redesign of the R/F and use of alternative materials of construction. One design alternative includes use of a polymer outer shell material component that incorporates in its construction an advanced insulation technology that reduces thermal bridging and edge losses. Computer modelling of a R/F door incorporating the concept shows a doubling of effective thermal resistance over conventional R/F designs. The report also addresses materials and manufacturing technologies needed to fabricate polymer barrier advanced insulation components for R/Fs.

WIDEBANDING TECHNIQUES FOR VHF ANTENNAS, 1 Technical Report, 1 Oct. 1991 - 30 Sep. 1992
Ramakrishna Janaswamy 30 Sep. 1992 38 p
(AD-A259301; NPS-EC-92-010) Avail: CASI HC A03/MF A01

A straight wire antenna of fixed length is narrow band due to the rapid variations in its input impedance, and to a lesser degree, in its radiation pattern. A wire antenna is, however, lightweight, easy to fabricate and simple to mount on any platform. To make a wire antenna broadband, we need resistive and/or reactive loading along its length. In this report, we consider monopole antennas loaded with modified Wu-King resistivity profile, and complex lumped loads. A 1-m monopole antenna is considered over 30-90 MHz. Input impedance and radiation efficiency data for the two cases are generated by employing the moment method. Tuning networks are designed using the real frequency method of Carlin to maximize the power transfer from a 50 ohm source to the antenna. Overall performance of the antenna by taking into account the mismatch loss due to the tuning network and resistive loss due to the loading is studied. GRA

EXPERIMENTAL, THEORETICAL AND COMPUTATIONAL STUDY OF FREQUENCY UPSHIFT OF ELECTROMAGNETIC RADIATION USING PLASMA TECHNIQUES
C. Joshi Sep. 1992 32 p
(Contract DE-FG03-91ER-12114)
(DE93-005092; DOE/ER-12114/2) Avail: CASI HC A03/MF A01

This following is a second year progress report on 'Experimental, Theoretical, and Computational Study of Frequency Upshift of Electromagnetic Radiation Using Plasma Techniques.' The highlights are presented. Ionization fronts were shown to frequency upshift EM radiation by greater than a factor 5. In the experiments, 33 GHz microwave radiation is upshifted to more than 175 GHz using a relativistically propagating ionization front created by a laser beam. A Letter describing the results was published in Physical Review Letters and an invited paper was submitted to IEEE Trans. in Plasma Science. DOE

ON USING SCATTERING STATISTICS FOR ULTRA WIDEBAND ELECTROMAGNETIC TARGET CLASSIFICATION AND IDENTIFICATION
E. K. Miller 1992 15 p Presented at the 4th International Conference on Ultra-Wideband, Short-Pulse Electromagnetics, Brooklyn, NY, 8-10 Oct. 1992
(Contract W-7405-eng-36)
(DE93-003809; LA-UR-92-3581; CONF-9210166-3) Avail: CASI HC A03/MF A01

An interrogating electromagnetic field has information encoded upon it by any target from which it scatters. This process presents the electomagneticest/signal processor with a problem that ranges across questions such as (1) detection--is there a target?; (2) to which class does that target belong?; (3) what specific member of that class is the target?; and (4) what are the targets electrical and/or geometrical properties in increasing order of specificity and information requirements? Radar systems have been analyzed primarily from the perspective of question (1) above. In recent years, however, increasing attention has been devoted to questions (2)-(4) as the need for more specific and complete information beyond target detection has arisen. In the following discussion, we present conceptually a statistics, information-oriented approach to this general class of problems. DOE

EMERGENCY VEHICLE ALERT SYSTEM, PHASE 2
Tom Barr, Warren Harper, Bill Reed, and David Wallace 29 Jan. 1993 152 p
(Contract NAS8-39383)
(NASA-CR-192464; NAS 1.26:192464; ARI/92-R-050) Avail: CASI HC A08/MF A02

The EVAS provides warning for hearing-impaired motor vehicle drivers that an emergency vehicle is in the local vicinity. Direction and distance to the emergency vehicle are presented visually to the driver. This is accomplished by a special RF transmission/reception system. During this phase the receiver and transmitter from Phase 1 were updated and modified and a directional antenna developed. The system was then field tested with good results. Static and dynamic (moving vehicle) tests were made with the direction determined correctly 98 percent of the time. Author

A CLASS OF HYBRID FINITE ELEMENT METHODS FOR ELECTROMAGNETICS: A REVIEW
J. L. Volakis, A. Chatterjee, and J. Gong Mar. 1993 36 p
(Contract NCA2-653)

(NASA-CR-192631; NAS 1.26:192631; UMICH-028918-4-T) Avail: CASI HC A03/MF A01

Integral equation methods have generally been the workhorse for antenna and scattering computations. In the case of antennas, they continue to be the prominent computational approach, but for scattering applications the requirement for large-scale computations has turned researchers' attention to near neighbor methods such as the finite element method, which has low O(N) storage requirements and is readily adaptable in modeling complex geometrical features and material inhomogeneities. In this paper, we review three hybrid finite element methods for simulating composite scatterers, conformal microstrip antennas, and finite periodic arrays. Specifically, we discuss the finite element method and its application to electromagnetic problems when combined with the boundary integral, absorbing boundary conditions, and artificial absorbers for terminating the mesh. Particular attention is given to large-scale simulations, methods, and solvers for achieving low memory requirements and code performance on parallel computing architectures. Author (revised)

NEWLY AVAILABLE TECHNOLOGIES PRESENT EXPANDING OPPORTUNITIES FOR SCIENTIFIC AND TECHNICAL INFORMATION EXCHANGE

Jean M. Tolzman Mar. 1993 17 p
(Contract NASw-4584)
(NASA-CR-4494; NAS 1.26:4494) Avail: CASI HC A03/MF A01

The potential for expanded communication among researchers, scholars, and students is supported by growth in the capabilities for electronic communication as well as expanding access to various forms of electronic interchange and computing capabilities. Research supported by the National Aeronautics and Space Administration points to a future where workstations with audio and video monitors and screen-sharing protocols are used to support collaborations with colleagues located throughout the world. Instruments and sensors all over the world will produce data streams that will be brought together and analyzed to produce new findings, which in turn can be distributed electronically. New forms of electronic journals will emerge and provide opportunities for researchers and scientists to electronically and interactively exchange information in a wide range of structures and formats. Ultimately, the wide-scale use of these technologies in the dissemination of research results and the stimulation of collegial dialogue will change the way we represent and express our knowledge of the world. A new paradigm will evolve-perhaps a truly worldwide 'invisible college'. Author (revised)

COMMUNICATIONS AND CONTROL FOR ELECTRIC POWER SYSTEMS Report, 1991

H. Kirkham 15 Jan. 1992 87 p Prepared for Department of Energy, Washington, DC
(Contract NAS7-918)
(NASA-CR-192794; JPL-Publ-92-19; NAS 1.26:192794) Avail: CASI HC A05/MF A01

A long-term strategy for the integration of new control technologies for power generation and delivery is proposed: the industry would benefit from an evolutionary approach that would adapt to its needs future technologies as well as those that it has so far not heeded. The integrated operation of the entire system, including the distribution system, was proposed as a future goal. The AbNET communication protocols are reviewed, and additions that were made in 1991 are described. In the original network, traffic was controlled by polling at the master station, located at the substation, and routed by a flooding algorithm. In a revised version, the polling and flooding are modified. The question of interfacing low-energy measurement transducers or instrument transformers is considered. There is presently little or no agreement on what the output of optical current transducers (CT's) should be. Appendices deal with the calibration of current transducers; with Delta modulation, a simple means of serially encoding the output of an OCT; and with noise shaping, a method of digital signal processing that trades off the number of bits in a digital sample for a higher number of samples. (Contract NAS7-918)
(NASA-CR-192793; JPL-Publ-92-29; NAS 1.26:192793) Avail: CASI HC A07/MF A02

The Goldstone Solar System Radar (GSSR) station at NASA's Deep Space Communications Complex in California's Mojave Desert is described. A short chronological account of the GSSR's technical development and scientific discoveries is given. This is followed by a basic discussion of how information is derived from the radar echo and how the raw information can be used to increase understanding of the solar system. A moderately detailed description of the radar system is given, and the engineering performance of the radar is discussed. The operating characteristics of the Arcibo Observatory in Puerto Rico are briefly described and compared with those of the GSSR. Planned and in-process improvements to the existing radar, as well as the performance of a hypothetical 128-m diameter antenna radar station, are described. A comprehensive bibliography of referred scientific and engineering articles presenting results that depended on data gathered by the instrument is provided. Author

REAL-TIME TRANSMISSION OF DIGITAL VIDEO USING VARIABLE-LENGTH CODING

Thomas P. Bizon, Mary Jo Shalkhauser, and Wayne A. Whyte, Jr. Mar. 1993 17 p Presented at the Data Compression Conference (DCC '93), Snowbird, UT, 30 Mar. - 1 Apr. 1993; sponsored by the IEEE
(RTOP 144-10-10)
(NASA-TM-106092; E-7730; NAS 1.15:106092) Avail: CASI HC A03/MF A01

Huffman coding is a variable-length lossless compression technique where data with a high probability of occurrence is represented with short codewords, while 'not-so-likely' data is assigned longer codewords. Compression is achieved when the high-probability levels occur so frequently that their benefit outweighs any penalty paid when a less likely input occurs. One instance where Huffman coding is extremely effective occurs when data is highly predictable and differential coding can be applied (as with a digital video signal). For that reason, it is desirable to apply this compression technique to digital video transmission; however, special care must be taken in order to implement a communication protocol utilizing Huffman coding. This paper addresses several of the issues relating to the real-time transmission of Huffman-coded digital video over a constant-rate serial channel. Topics discussed include data rate conversion (from variable to a fixed rate), efficient data buffering, channel coding, recovery from communication errors, decoder synchronization, and decoder architectures. A description of the hardware developed to execute Huffman coding and serial transmission is also included. Although this paper focuses on matters relating to Huffman-coded digital video, the techniques discussed can easily be generalized for a variety of applications which require transmission of variable-length data. ELECTROMAGNETISM FROM COUNTING

H. P. Noyes Dec. 1992 11 p Presented at the 3rd Physical Interpretations of Relativity Theory Conference, London, England, 14-18 Sep. 1992
(Contract DE-AC03-76SF-00515)
(DE93-006930; SU-SLAC-PUB-5858; CONF-9209298-1) Avail: CASI HC A03/MF A01

The fact that experimental accuracy is finite makes the measurement of particle positions and velocities non-local and often non-commutative even in a scale invariant theory. Applied to electromagnetic and gravitational phenomena, we argue that this leads to a relativistic action at a distance theory in which 'fields' are simply a quasi-local interpolating concept extrapolated from macroscopic conservation laws. We sketch how this analysis could lead to classical field equations as a macroscopic approximation to relativistic quantum mechanics, but do not construct a formal proof. DOE

POLARIMETRIC INVESTIGATION OF EDGE SCATTERING BY MONO- AND BISTATIC MICROWAVE IMAGING Ph.D. Thesis - Ulm Univ. [POLARIMETRISCHE UNTERSUCHUNG DER KANTENSTREUUNG IN DER MONO- UND BISTATISCHEN MIKROWELLENABBILDUNG]
Wolfgang Herdeg Jul. 1991 153 p In GERMAN
(DLR-FB-91-32; ETN-93-91922) Avail: CASI HC A08/MF A02; DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

The scattering of electromagnetic waves from edges is investigated with regard to frequency, aspect angle, polarization, and bistatic angle. The edges of simple metal objects (cubes, plates, and wedges) are resolved in range and cross range using a high resolution microwave imaging process and are investigated as canonical structures. The Geometrical Theory of Diffraction (GTD) is used as a theoretical model. The scattering coefficients of GTD are compared with experiment. The polarimetric results are presented using the Hymen parameters. Microwave mirrors, which are large metal plates which reflect the bistatic scattering contribution to the monostatic radar, are introduced, in order to carry out bistatic measurements on a monostatic radar range. Experimental results are in agreement with the proposed concepts. ESA

DATA SELECTION FOR FAST PROJECTION TECHNIQUES: A COMPARATIVE STUDY OF DIRECTION FINDING PERFORMANCE Technical Report
Mylene Toulgoat and Ross M. Turner Dec. 1992 31 p
(AD-A259916; DREO-1135) Avail: CASI HC A03/MF A01

This report describes simulation studies of fast projection techniques for direction finding of jammer signals. These techniques are based on a data selection criterion applied directly to the data vectors obtained at the output of an antenna array. The selected data vectors are used in fast projection algorithms to estimate the jammer subspace and then calculate the directional spectrum. Three such algorithms are described ranging from the fastest but least effective to the most computationally demanding but most effective. These algorithms provide a better tradeoff of performance versus computational load than has been available. Relative performance is compared with that of the MUSIC technique for test cases which evaluate the minimum resolution threshold achievable and the effect of the jammer strength relative to the receiver noise. SMART ELECTROMAGNETIC STRUCTURES: THE NEURAL ANTENNA Final Report, 15 Aug. 1989 - 14 Aug. 1992
Michael H. Thursby 11 Jan. 1993 18 p
(Contract DAAL03-89-G-0085)
(AD-A260469; ARO-27191.5-EL-SM) Avail: CASI HC A03/MF A01

Smart electromagnetic structures (SEMS) are defined as structures capable of interacting with their surrounding electromagnetic fields and either influencing the field or sensing and adapting to its presence. A structure is smart when it integrates sensing elements (e.g., antennas), processing elements (neural networks) and control elements (diodes) autonomously. SEMS provide an adaptive electromagnetic (EM) environment for the structure on which they are mounted. The ability to adapt derives from the closed loop nature of the SEMS. The speed of adaptation is determined by the speed of the loop, which is set by the computational elements. Our experiments shown the time required for a response is about fifteen gate delays. The integration of artificial neural processors with tuneable antennas was proposed several years ago by our group. This synergy over the past three years was studied. The control of the operating frequency of a microstrip patch antenna was demonstrated. We believe that ours is a unique program offering great potential for payoff in the area of electromagnetic smart skins. Our main goal in this program was to '...determine the feasibility of a neural network controlled antenna and to quantify the ability of the antenna and the NN to learn to tune automatically to the center frequency of a received signal.' These goals were achieved and spun off neural networks that have application of radar and communications systems. Because of its self adaptability the closed loop neural control of an antenna element, provides the potential for design of an easily manufacturable antenna which is immune to typical siting problems, and is tolerant to moderate external damage. (AD-A260407; ARO-25045.68-EL) Avail: CASI HC A03/MF A01

Representative projects from Army Research Office are summarized. Following the narrative descriptions with appropriate illustrations, a complete list of articles published in scientific journals and those presented at national and international conferences is provided. Lists of personnel and advanced degrees are also included. The projects were carried out at The University of Texas at Austin and later at UCLA. Topics covered include: quasi-optical technique; active antenna; active filter; traveling wave transistor; slow wave, planar transmission line; and discontinuities. GRA

GEOMAGNETIC STORM ENVIRONMENTS AND EFFECTS ON ELECTRICAL SYSTEMS
F. M. Tesche and P. R. Barnes 1992 6 p Presented at the 10th International Zurich Symposium and Technical Exhibition on Electromagnetic Compatibility, Zurich, Switzerland, 9-11 Mar. 1993
(Contract DE-AC05-84OR-21400)
(DE92-041257; CONF-930353-1) Avail: CASI HC A02/MF A01

This paper briefly reviews the behavior of the earth's magnetic field during a geomagnetic storm. Temporal variations of the B-field on the earths surface can induce an electric field in the earth, and this E-field will induce currents to flow in long, grounded conductors. Previous experience with geomagnetic storms indicates that such geomagnetically-induced currents can cause damage to power system components, and at times, can cause power blackouts. This paper presents some recently measured geomagnetic field variations, and illustrates how the induced electric field can be calculated, assuming a simple model of the imperfectly conducting earth. This calculation may be performed either in the time or in the frequency domain. Approximations to the time dependence of the geomagnetic field permit an analytical evaluation of the corresponding E-field in the earth, and this results in a simple expression for the transient Enfield. A knowledge of this Enfield is important in understanding the effects of geomagnetic storms on the power system, and in devising protection methods. DOE

FOCAL PLANE ARRAYS FOR SUBMILLIMETER WAVES USING TWO-DIMENSIONAL ELECTRON GAS ELEMENTS: A GRANT UNDER THE INNOVATIVE RESEARCH PROGRAM Final Report, 1 Mar. 1989 - 29 Feb. 1992

K. Sigfrid Yngvesson and Kei-May Lau 29 Feb. 1992 57 p

(Grant NAGw-1659)

(NASA-CR-192271; NAS 1.26:192271) Avail: CASI HC A04/MF A01

This final report describes a three-year research effort, aimed at developing new types of THz low noise receivers, based on bulk effect ('hot electron') nonlinearities in the Two-Dimensional Electron Gas (2DEG) Medium, and the inclusion of such receivers in focal plane arrays. 2DEG hot electron mixers have been demonstrated at 35 and 94 GHz with three orders of magnitude wider bandwidth than previous hot electron mixers, which use bulk InSb. The 2DEG mixers employ a new mode of operation, which was invented during this program. Only moderate cooling is required for this mode, to temperatures in the range 20-77 K. Based on the results of this research, it is now possible to design a hot electron mixer focal plane array for the THz range, which is anticipated to have a DSB receiver noise temperature of 500-1000K. In our work on this grant, we have found similar results the the Cronin group (resident at the University of Bath, UK). Neither group has so far demonstrated heterodyne detection in this mode, however. We discovered and explored some new effects in the magnetic field mode, and these are described in the report. In particular, detection of 94 GHz and 238 GHz, respectively, by a new effect, 'Shubnikov de Haas detection', was found to be considerably stronger in our materials than the cyclotron resonance detection. All experiments utilized devices with an active 2DEG region of size of the order of 10-40 micrometers long, and 20-200 micrometers wide, formed at the heterojunction between AlGaAs and GaAs. All device fabrication was performed in-house. The materials for the devices were also grown in-house, utilizing OMCVD (Organo Metallic Chemical Vapor Deposition). In the course of this grant, we developed new techniques for growing AlGaAs/GaAs with mobilities equalling the highest values published by any laboratory. We believe that the field of hot electron mixers and detectors will grow substantially in importance in the next few years, partly as a result of the opportunity given us through this grant, which represents the major effort in the US so far. We note, however, that parallel research on hot electron mixers in thin film superconductors in Russia, and recently in Sweden, have demonstrated mixing up to 1 THz, with the potential for low-noise receivers for frequencies up to many THz. The three groups recently assessed the relative adtantages of 2DEG and superconducting film mixers in a joint paper (Kollberg et al., 1992; see Appendix II). Author (revised)

COMBINED MAGNETIC VECTOR-SCALAR POTENTIAL FINITE ELEMENT COMPUTATION OF 3D MAGNETIC FIELD AND PERFORMANCE OF MODIFIED LUNDELL ALTERNATORS IN SPACE STATION APPLICATIONS Ph.D. Thesis

Ren H. Wang 27 Feb. 1991 337 p

(Grant NAG3-818)

(NASA-CR-192348; NAS 1.26:192348) Avail: CASI HC A15/MF A03

A method of combined use of magnetic vector potential (MVP) based finite element (FE) formulations and magnetic scalar potential (MSP) based FE formulations for computation of three-dimensional (3D) magnetostatic fields is developed. This combined MVP-MSP 3D-FE method leads to considerable reduction by nearly a factor of 3 in the number of unknowns in comparison to the number of unknowns which must be computed in global MVP based FE solutions. This method allows one to incorporate portions of iron cores sandwiched in between coils (conductors) in current-carrying regions. Thus, it greatly simplifies the geometries of current carrying regions (in comparison with the exclusive MSP based methods) in electric machinery applications. A unique feature of this approach is that the global MSP solution is single valued in nature, that is, no branch cut is needed. This is again a superiority over the exclusive MSP based methods. A Newton-Raphson procedure with a concept of an adaptive relaxation factor was developed and successfully used in solving the 3D-FE problem with magnetic material anisotropy and nonlinearity. Accordingly, this combined MVP-MSP 3D-FE method is most suited for solution of large scale global type magnetic field computations in rotating electric machinery with very complex magnetic circuit geometries, as well as nonlinear and anisotropic material properties. EUROPEAN TELECOMMUNICATIONS STANDARDS INSTITUTE. APRELIMINARY ANALYSIS

S. M. Besen 1991 15 p Sponsored by NSF

(Grant NSF IRI-88-05845)

(PB93-138824; RAND/N-3320-NSF) Avail: CASI HC A03/MF A01

The European Telecommunications Standards Institute (ETSI) was formed to accelerate standardization and promote greater harmonization among European telecommunications systems. The article describes ETSI's organization and structure and relates them to its expected behavior and performance. Some characteristics such as the use of weighted majority voting rule, are likely to expedite the setting of standards; others, such as the institute's diverse membership and the decision to avoid recognizing alternative standards, may make it more difficult. Overall, ETSI's structure may be seen as an effort to find the right balance of features. GRA

LASER RANGE CAMERA DATA FUSION

M. Beckerman and F. J. Sweeney 1993 7 p Presented at the 5th Topical Meeting on Robotics and Remote Systems, Knoxville, TN, 26-29 Apr. 1993

(Contract DE-AC05-84OR-21400)

(DE93-005159; CONF-930403-9) Avail: CASI HC A02/MF A01

Results are presented of an investigation of the fusion of image data from amplitude-modulated CW laser radar. The goal is the design of an algorithm for simultaneously recovering the underlying surfaces and discontinuities in a manner which is free from errors and artifacts. To accomplish this goal, the images are modeled as a set of coupled Markov random fields. These fields, defined within a Bayesian framework, describe the smooth-surface, discontinuity, and noise properties of the images. As a resuli of the Markovian property simulated annealing can be used to find the global miminum. DOE

FOCUSED TWO-DIMENSIONAL RADAR IMAGING USING COHERENT TIME DOMAIN SIGNALS

Karl-Heinz Bethke (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Cologne, Germany.) Aug. 1992 84 p Transl. into ENGLISH of Fokussierte Zweidimensionale Radarabbildung Durch Koharente Signalverarbeitung im Zeitbereich Original language document was announced as N92-19360

(ESA-TT-1272; DLR-FB-91-19; ETN-93-93518) Avail: CASI HC A05/MF A01; original German version available from DLR, Wissenschatfliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

A rapid method for generating two dimensional focused radar images of rotating objects is presented. While range resolution is performed in discrete range steps in real time using a coherent short pulse radar, the cross range resolution is generated using the synthetic aperture principle, by means of efficient fast Fourier transform algorithms with subsequent data processing. The degradation in the imaging performance resulting from the imaging algorithm as well as from migration of scattering centers through a plurality of resolution cells is eliminated by an extended phase correction and by a tracking procedure acting on the moving scattering centers. This is done by reorganizing the range-sweep data in range: at every range steps are used to form a focused image. Experimental results demonstrate the capability of the presented imaging procedure. ELECTROMAGNETIC SCATTERING CROSS SECTIONS FROM THE BODIES OF REVOLUTION, VOLUME 1 Final Report
P. Park and J.-M. Beaulieu Sep. 1991 438 p
(Contract DSS-W-7714-8-5829)
(DREV-CR-645; MPBT-335-2; CTN-93-60674) Avail: CASI HC A19/MF A04

The electromagnetic scattering from perfectly conducting, dielectric, and coated bodies of revolution is computed using the moment method technique. The electric field integral equation is used to formulate the problem and the corresponding equations are solved numerically. A numerical code is developed, tested, and verified. A series of measurements was carried out at an electromagnetic measurement facility for coated and uncoated perfectly conducting cylinders. The measured values are compared with the computed results. Satisfactory agreements are achieved for cylinder sizes up to 6 wavelengths. The accuracy, convergence, and range of applicability of the numerical code are investigated by computing the extinction coefficients as a function of the number of expansion functions at various size parameters and dielectric constants. The number of expansions required to achieve a given accuracy increases linearly with the size parameter. No strong dependence is observed with respect to dielectric constant as long as it is greater than 0.01. A brief study of cavity resonance effects was carried out, and a possible method to identify and remove these spurious phenomena is suggested. Author (CISTI)

HIGH ARCTIC HIGH FREQUENCY RADIO COMMUNICATIONS AND A SEVEN DAY POLAR CAP ABSORPTION EVENT
Mervin R. Black Nov. 1991 32 p
(DREP-TM-91-18; CTN-93-60713) Avail: CASI HC A03/MF A01

High frequency radio communications experienced in the high Arctic during the Iceshelf 91 Arctic Acoustics field program are reported. During the 19 Mar. - 26 Apr. 1991 period, high frequency radio communications which rely on ionospheric reflection for propagation were monitored, and the ability to communicate using single sideband voice mode was recorded. In the period studied, radio conditions ranged from very good to a complete blackout for seven days (23-30 March) during a severe polar cap absorption event. Propagation prediction bulletins prepared by the USAF Global Weather Center in Nebraska were used on a daily basis for operational planning where good radio communication conditions with remote field camps and transiting aircraft were critical. Good agreement was found between the predictions and the observed communication conditions. The eleven-year sunspot cycle peaked in 1990 but is still expected to have a significant effect on radio communication conditions for one or two more field seasons. Author (CISTI)

MICROWAVE LINE-OF-SIGHT CHANNEL MEASUREMENTS, CHANNEL MODELLING, AND APPLICATION OF CHANNEL MODELS TO DIGITAL RADIO PERFORMANCE PREDICTION Ph.D. Thesis
Sven-Gustav Haeggman Helsinki, Finland Finnish Academy of Technology 1991 55 p Sponsored in part by Telecom Finland, and Tekniikan Edistaemissaeaetioe
(Acta-Pol-Scand-El-69; ISBN-951-666-336-2; ETN-93-93477) Avail: CASI HC A04/MF A01

Time and frequency domain measurements with pulse and sweep techniques, derivation of channel models from the results, and application of the model to performance prediction are studied. The measuring systems and the methods leading to channel models are reviewed. Statistical models are obtained only from the frequency domain results. Single and two channel models for signal level equivalent three path models are derived. The latter single and two channel models are also available as parameter time history. Three performance prediction approaches are tried. The first approach is based on Rummler's channel model and on signature sets for various interference conditions. The second approach is based on the derived channel models. Several methods are used, also a new method where time is divided into mutually exclusive flat and dispersive fade time. The total outage can be summed, but normally flat fading outage can be neglected. The third approach is based on the time history model. Outage state is determined from signature sets, and cumulative outage is obtained from the stored time information. The method can be extended to calculation of the performance measures defined by CCIR. ESA

A LEAKAGE CANCELLER FOR A SINGLE ANTENNA RADAR M.S. Thesis
David A. Green 1991 74 p Sponsored by Ministry of Defence Procurement Executive, London, England
(ETN-93-93495) Copyright Avail: CASI HC A04/MF A01

A description of the construction and testing of a dynamic cancelling system designed to alleviate the problems inherent in using a single antenna radar system, specifically those of circulator leakage causing receiver desensitization, is presented. The system was constructed at X band using components available in the laboratory, and all the required electronics were fabricated using standard and readily available components. Results are presented demonstrating that the canceller works over a very narrow bandwidth (approximately 40 to 50 MHz at X band). The design of a mixer to be used at Ka band (13.5 GHz) is described. The mixer was intended to be the primary element in a similar type of cancelling circuit to be used in the MSSL short range scatterometer, which is part of the ERS-1 European remote sensing satellite calibration and validation program. EFFECT OF CODE AUGMENTATION OR TRUNCATION ON THE SIGNALS PRODUCED BY A TIME-INTEGRATING CORRELATOR
N. Brousseau Oct. 1992 80 p
(AD-A259802; DREO-92-11) Avail: CASI HC A05/MF A01

The characteristics of the signals produced by a time-integrating correlator when processing augmented or truncated code are analyzed. It deals specifically with the description of the peak trains generated by either the autocorrelation of the modified code, the cross-correlation of the modified code with the original code, or the cross-correlation of the modified code with a test code of the same length. It is demonstrated that the complex peak patterns thus generated contain information about the modification of the code and that it is possible to retrieve that information by applying specific processing methods. Four processing methods are proposed. The first method extracts information from the peak patterns generated by the autocorrelation of the modified signal. The second method uses the cross-correlation of the modified signal with the original signal while the third method deals with the cross-correlation of the modified code with a test code that has the same length as the modified code. The fourth method allows the determination of the initial fill of truncated codes when the signal-to-noise ratio is sufficiently good. GRA

METHODOLOGY DEVELOPMENT FOR THERMAL ANALYSIS OF SPACE POWER MICROWAVE RECTIFYING ANTENNAS (RECTENNAS) Ph.D. Thesis
Murali Natarajan Kadiramangalam 1992 164 p
Avail: Univ. Microfilms Order No. DA9237947

Beaming power at microwave or millimeter wave frequencies is a means of transmitting power in air or vacuum. The reception and DC power conversion device is called a rectenna (element). To date rectennas

have been designed either for powering aircraft or for solar power satellites. Use of rectennas in space missions will entail incident power densities greater than previously envisioned. This, coincident with absence of convective energy dissipation may result in temperatures above design limits. Thus it is necessary to predict the temperatures both globally (spatially) and locally (detailed) for rectenna element arrays. In this thesis such a methodology is developed with specific numerical results typical of space missions in earth orbit, including incident solar and albedo fluxes and radiative heat dissipation to 0 K. A rectenna is comprised of subarrays, and in turn single unit cells - the smallest repeating element. The unit cell contains a diode which converts incident microwave to DC; inefficiencies result in a localized heat source. The heat conduction equation is solved numerically in this unit cell. Since the unit cell boundaries are not coincident with the lines of symmetry, the solution is also obtained by 'shortening' the cell boundaries. This provides the local solution, but to provide the global solution (including Joule heating) the heat conduction equation is solved for a three unit cell array. These analyses are performed for both a detailed 3D and simple quasi 1D representation. Comparing results of the detailed and simple representations for a unit cell, a shorted unit cell and a three unit cell array; a methodology is developed and demonstrated to be accurate for arbitrary size arrays. These calculations were performed for a 2.45 linear polarized (LP) rectenna. The major conclusions are: the methodology developed is general and can readily be applied to the thermal design of higher frequency rectennas, where the temperature calculation is critical; and 2.45 LP rectenna diode temperatures are excessive and this rectenna needs to be redesigned. Dissert. Abstr.

RADIOLOCATION TECHNIQUES [LES TECHNIQUES DE RADIOLOCALISATION]
Nov. 1992 346 p Symposium held in London, England, 1-5 Jun. 1992 Original contains color illustrations
(AGARD-CP-528; ISBN-92-835-0695-2) Copyright Avail: CASI HC A15/MF A03

Modern defense systems must have a comprehensive surveillance capability. A key component of a surveillance system is the ability to detect and to locate radio signals in the entire radio spectrum from extremely low frequencies through millimeter wavelengths. Various techniques are used to determine the angle of arrival of a radio signal and the distance to the source. This often involves complex signal processing techniques. The symposium addressed first propagation aspects with emphasis on ionospheric characteristics and effects. Two sessions were devoted to the description of radio location techniques such as single site location and another two to radio location measurements and systems. One session covered signal processing techniques in radio location applications. One session covered classified subjects and will be published in a classified addendum. For individual titles, see N93-23599 through N93-23631.

LATERAL DEVIATION OF VLF RADIO WAVES DUE TO DIFFRACTION AND SCATTERING FROM COAST-LINES, MOUNTAIN RANGES, AND POLAR ICE CAPS
James R. Wait *In* AGARD, Radiolocation Techniques Nov. 1992 12 p (For primary document see N93-23598 08-32)
Copyright Avail: CASI HC A03/MF A03

This paper deals with a physical theory of radio wave propagation in the earth ionosphere waveguide when allowance is made for lateral non-uniformities in the lower boundary. A combined hybrid ray and mode analysis is adopted which reduces to the now conventional formulation when the lower boundary is uniform. For obvious reasons, the mathematical details will not be presented but the optical interpretation is given and the physical concepts are illustrated in a meaningful fashion. A case of particular interest is when the global propagation of the VLF signal arrives from both the direct path as well as a sometimes very strong resonant scatter from a continental mountain range 1000 km or more off the great circle path. Other examples occur when the signal actually diffracts around convex coast-lines and continental margins such as the Antarctic ice cap. In such cases, the direct path signal over the highly lossy medium is highly attenuated and may be out of contention. In the simplest theory of 'horizontal bending' of VLF wave guide modes, the conversion of modes, of one order to another, is ignored. But, by employing mode match techniques, the conversion of modes of order m to modes of order n (reflected) and to modes of order p(transmitted) can be estimated. Both a scalar and a vector version of the formulation are outlined. Actually the scalar version is really more appropriate for dealing with acoustic ducts with inhomogeneous walls when the horizontal direction of propagation is oblique to the junction planes. Strictly speaking the full blown vector problem must be dealt with in the electromagnetic case if proper allowance is to be made for the inevitable coupling between the TM (transverse magnetic) and TE (transverse magnetic) modes. PROPAGATION CHARACTERISTICS OF THE IONOSPHERIC TRANSMISSION WINDOW RELATING TO LONG WAVE RADIO LOCATION ISSUES
Paul A. Kossey and Edward A. Lewis (Systems Integration Engineering, Inc., Lexington, MA.) *In* AGARD, Radiolocation Techniques Nov. 1992 17 p (For primary document see N93-23598 08-32)
Copyright Avail: CASI HC A03/MF A03

Most applications of long radio waves (ELF/VLF/LF/MF) are ground-based and exploit the fact that such signals can propagate to great distances via reflections from the lower ionosphere. It is known however that, owing to the influence of the earth's magnetic field, long wave signals can penetrate through the ionosphere as well; at times, the waves penetrate with relatively little loss, depending on ionospheric conditions and other propagation factors. This has prompted investigations of the long wave 'ionospheric transmission window' as part of efforts to assess the feasibility of deploying long wave emitters in space for terrestrial applications and/or for exploiting, in space, signals emanating from ground-based long wave transmitters. This paper outlines results of theoretical and experimental investigations of the ionospheric transmission window over the frequency range from about 100 Hz to 500 kHz, with emphasis on directional issues associated with long wave penetration of the ionosphere. THE EFFECTS OF MULTIPATH SCATTER FROM WIND DRIVEN GRAVITY WAVES ON LINES OF BEARING SERVING AS DIRECTION FINDERS
R. H. Ott *In* AGARD, Radiolocation Techniques Nov. 1992 6 p (For primary document see N93-23598 08-32)
Copyright Avail: CASI HC A02/MF A03

Unambiguous locations for target transmitters are based on lines of bearing (LOB's) obtained by radio direction finding (DF) methods. These target location estimates based on intercepted LOB's are subject to error if multipath exists. This multipath may result from sky wave interference or sea scatter from rough seas. Sky wave multipath becomes important for ranges greater than 300 km while ground wave multipath may be significant for ranges less than about 100 km. Although, the groundwave loss may be greater than the one-hop sky wave mode, it may be comparable to the loss associated with the two-hop mode. Therefore both groundwave and sky wave multipath may contribute to LOB errors for a given fleet exercise. For the case of sky wave multipath, newer DF systems will be able to differentiate sky wave signals from ground wave signals when the elevation angle is greater than about 18 deg. In this paper, groundwave multipath is estimated using the compensation theorem. This method provides a convenient analytical tool for relating the change in mutual impedance between a transmitting monopole and a receiving loop over a rough sea surface and a flat sea. The change in mutual impedance, in turn, is related to the change in current in each of the receiving loops used to generate LOB's. Some predicted and observed examples of fleet exercise LOB errors from wind generated swell will be given based on target transmitter frequency, wind direction, and speed of the ship carrying the DF system. PROPAGATION EFFECTS ON HF DIRECTION FINDING
George H. Millman *In* AGARD, Radiolocation Techniques Nov. 1992 12 p (For primary document see N93-23598 08-32)
Copyright Avail: CASI HC A03/MF A03

Estimates are made of the propagation errors that can be made in the measurement of the geographic coordinates of an HF emitter when utilizing HF direction finding techniques. The sources of the errors considered in

this analysis are those due to the following: (1) imprecise knowledge of the ionospheric reflection height; (2) ionospheric tilts, i.e., gradients of electron density; and (3) tropospheric refractive bending. Author (revised)

Modeling of the ionosphere is a necessity in numerous applications: the physical study of an area, telecommunications, transhorizon radars, and radio location. Radio location from a single sensor is particularly attractive but requires, in the decametric propagation range, knowledge with a sufficient precision of the ionospheric area within which the trajectories of the radii are controlled, not only by the vertical profile of the ionization, but also by the horizontal gradient. A tracing of a radius in an ionosphere is investigated by making use of a Bradley-Dudeney model in the presence of horizontal gradients whose transversal components are not null. One can see that the components draw the propagations outside of a large circle with important deviations on the ground due to the reflection occurring in region F. Taking into account these gradients is indispensable for a correct location, which makes their estimation necessary. Radio location from a single sensor necessitates therefore the placement in the same location of a means of measurement. A retrodiffusion probe easily brings anisotropies to light. It represents a simple means which is possible to put to work with very little power and is therefore attractive. The principal difficulty of this technique is in the resolution of an inverse problem which, aside from the measurements obtained, permits the discovery at all points of the observation zone of the vertical profile from which the gradients are deduced. It is a difficult problem which has not yet really received a totally satisfactory solution in spite of important efforts produced by the scientific world. The stabilization of the solution appears to be possible thanks to new techniques which allow the measurement of new parameters. The angle of elevation of retrodiffused radii is one of these parameters, the importance of which was predicted during the 1960's. The utilization of this parameter, together with the data furnished by a retrodiffusion probe, permitting the observation of all azimuths, is developed in this presentation. Author (revised)

THE SPATIAL AND TEMPORAL CHARACTERISTICS OF HIGH FREQUENCY AURORAL BACKSCATTER
D. S. Choi, Bert Weijers, R. J. Norris, and N. B. Myers *In* AGARD, Radiolocation Techniques Nov. 1992 10 p (For primary document see N93-23598 08-32)
Copyright Avail: CASI HC A02/MF A03

Preliminary results from the measurements of high frequency (HF) backscattered signals from the auroral ionosphere using the Verona-Ava Linear Array Radar (VALAR) system are presented. VALAR is an experimental HF backscatter system capable of obtaining high resolution synoptic mapping of HF signals backscattered from field-aligned electron density irregularities in the auroral ionosphere. The receive system includes a 700 meter long linear array, providing the high azimuthal resolution required for determining the spatial distribution of HF auroral backscatter. Since the completion of the system tests and calibration at the end of 1989, experimental campaigns have been carried out on a near-monthly basis. In this paper, we provide a brief description of VALAR and present preliminary measurements of three types of phenomena: ground backscatter, slant-F, and auroral backscatter. Author (revised)

THE LONGITUDINAL OCCURRENCE OF EQUATORIAL F LAYER IRREGULARITIES
Jules Aarons *In* AGARD, Radiolocation Techniques Nov. 1992 12 p Sponsored by ONR (For primary document see N93-23598 08-32)
Copyright Avail: CASI HC A03/MF A03

Determining the morphology of F layer irregularities as a function of longitude in the equatorial region is vital for understanding the physics of the development of these irregularities. We aim to lay the observational basis which then can be used to test theoretical models. The question is whether the models are consistent with the morphology as we see it. According to our criteria, the data used should be confined to observations taken near the magnetic equator during quiet magnetic equator during quiet magnetic periods and at times within a few hours after sunset. Anomaly region data should be omitted for studying the generation mechanism. The questions to be answered by proposed mechanisms are (1) why do the equinox months have high levels of occurrence over all longitudes?; (2) why are there relatively high levels of occurrence in the Central Pacific Sector in the Jul.-Aug. period and in the 0-75 degree West Sector in the Nov.-Dec. period?; and (3) why are these very low levels of occurrence in Nov. and Dec. in the Central Pacific Sector and in Jul. and Aug. in the 0-75 degree West Sector? Satellite in-situ data, scintillation and spread F observations are reviewed. The limitation of each data set is outlined particularly as relevant to the bias produced by the existence of thin versus extended layers of irregularities. A cartoon of the occurrence pattern, as we see it, as a function of longitude is shown.

IRREGULAR MEDIA EFFECTS ON RADIOWAVE SIGNALS USED IN NAVIGATION AND POSITIONING SYSTEMS
Ezekiel Bahar *In* AGARD, Radiolocation Techniques Nov. 1992 12 p (For primary document see N93-23598 08-32)

Radiowave signals, over a very broad range of frequencies, are used extensively in navigation and propagation systems. These signals that propagate to very large distances from the transmitter across the earth's surface or through the ionosphere are significantly affected by media irregularities. Some of these irregularities are fixed while others fluctuate due to, for instance, the diurnal variations in the ionosphere. The magnitude and phase of CW signals are affected by the medium through which they propagate. Since these effects are frequency dependent, transient (pulsed) signals also undergo distortions and delays, which have a very significant impact on navigation and positioning systems. Thus, when CW signals are used for navigation or positioning, it is necessary to predict the deviations in the phase of the received signals (phase anomalies) due to medium effects. When pulsed signals are used for navigation and positioning, it is necessary to predict the signal delays due to the medium effects. Moreover, for given propagation paths, it is necessary to avoid the use of carrier frequencies that are more prone to signal distortions which make it very difficult to predict the time of arrival of the radio signals. It is necessary to obtain accurate predictions of the received signals as the demands on the navigation system become more stringent. Thus, for most relevant propagation problems, it is not sufficient to use idealized models of the propagation medium. The models that need to be considered consist of layers of nonuniform thickness with varying electromagnetic parameters. Since the ionosphere also needs to be considered, the medium is generally considered to be both inhomogeneous and anisotropic. For these irregular models of the curved earth-ionosphere propagation environment, it is not possible to obtain standard separable solutions for the propagation problem. Furthermore, since the solutions should be valid for a very broad range of radio frequencies, the physical/geometrical optics (high frequency) approach or the small perturbation (low frequency) approach cannot be used in general. In this work, a full-wave approach is described in detail. Radio wave propagation over irregular propagation paths is examined in detail. The phase anomalies and pulse delays and distortions for radio signals transmitted across hills and valleys on the earth's surface or over the oceans and through irregular layered models of the earth's crust and the ionosphere are determined using the full-wave approach. This paper deals with some propagation effects which can influence Single Station Location systems. We consider first, the direct problem which consists of estimating several directions of arrival of the incoming waves. For this purpose and for a given state of the ionospheric medium, the angles of all propagation paths and modes are determined. In a second step, the simplified model of waves coming from the ionosphere which has been developed before, permits us to simulate the behavior of radiogoniometers. We analyze the performance of goniometric systems based upon interferometry, data processing, and space-time processing. Proximity in such propagation modes leads to the addition of a polarization filtering procedure. The problem in reverse consists of locating the emitter thanks to the previous radiogoniometry results. We look at the effect of an imperfect knowledge of the profile, before introducing two SSL methods: the first dealing with vertical sounding results; and the second works from a partial updating profile. We also give an example of an influence of tilt.

A CURRENT ASSESSMENT OF SINGLE SITE LOCATING TECHNOLOGY
Robert B. Rose *In* AGARD, Radiolocation Techniques Nov. 1992 8 p (For primary document see . N93-23598 08-32)
Copyright Avail: CASI HC A02/MF A03

This paper describes the observed performance of a HF Single Site Locator (SSL) which employs current interferometer technology. One hundred and forty two locations were obtained from non-cooperative targets over a five day period in April 1989. Locations were determined from fast, high resolution azimuth and elevation angle of arrival measurements and a knowledge of the ionospheric reflecting medium. Exact emitter locations were determined post facto with ground truth data from the field units. Five modes of transmission were encountered and the signals were successfully located. Miss distance accuracies varied between 12.5 kilometers to 40.5 kilometers over ranges that varied from 109 kilometers to 526 kilometers. Performance varied as a function of modulation type with SSB voice being the most difficult to prosecute and packet, and burst signals were the easiest to locate. Also, performance varied as a function of range and the relationship of the operating frequency to the maximum usable frequency between the SSL and the target.

This paper considers the problem of passive radio location for the case of HF multipath propagation. A new technique is developed for the estimation of interpath time delay applying an eigen based super-resolution spectral estimation method. The technique samples the wavefield received by two spatially separated antennas to compute intersensor delay time for each constituent signal through a normalized eigen cepstral analysis. The intersensor delays and interpath delay are used in concert to estimate the location of the transmitter. The method is applied to experimental data in a preliminary proof-of-concept analysis.

PROCEDURES FOR DETERMINING THE LOCATION OF AN HF RADIO TRANSMITTER
Leo F. McNamara *In* AGARD, Radiolocation Techniques Nov. 1992 12 p (For primary document see N93-23598 08-32)
Copyright Avail: CASI HC A03/MF A03

The location of an HF transmitter may be derived by either of two methods, depending on what observations of the target transmitter are available. In the traditional approach currently adopted for strategic DF networks, the location is determined by triangulation using Lines of Bearing (LOB) of the signals observed at two or more HF-DF sites. This approach is called the LOB approach. Alternatively, the location may be derived by observations at a single DF site, if the observations are extended to include that of the elevation angle as well as the bearing of the incoming radio waves. Triangulation in the vertical plane containing the observed LOB, using a model of the propagation medium (the ionosphere), leads to an estimate of the position of the target transmitter. This approach is known as the Single Site Location (SSL) method. The success of the LOB approach depends heavily on two or more DF sites being able to hear and process the signals from the target transmitter, as well as on having reasonably favorable geometries. When these conditions are not met, the LOB approach fails. The SSL method, on the other hand, is applicable under almost all conditions. This paper, therefore, compares and contrasts the two approaches to determining the location of an HF transmitter. The relative advantages of the SSL approach are shown to be such that all HF-DF sites should logically be SSL sites.

A simple parametric target model fitting algorithm that gives a least squares fit to the observed in-phase and quadrature data across a linear sampled aperture array is outlined. The performance of this algorithm with various simulated signals and noise levels is presented. In particular, it is shown that this approach is quite robust in the presence of noise. The algorithm was developed for the analysis of data obtained on a large HF sampled aperture receiving array operated near Ottawa. An example of this analysis is given. In this instance, a long range signal exhibiting typical ionospheric fading (on individual array elements) is shown to be resolvable into three stable, coherent components spread over a 2.5 degree arc.

Recent conflicts have highlighted the benefits of 'soft-kill' electronic warfare (stand off, escort, and self screening jamming), during intrusion into areas protected by Air Defence (AD) radar networks. These conflicts have highlighted the need to protect and supplement the Recognized Air Picture (RAP) with the ability to locate and track the intruding jammers. A Passive Jammer Location (PJL) system, and some of the theory behind it, currently under development at the Marconi Research Center are described. The two basic geometrical techniques for locating unknown emitters, usually termed triangulation and trilateration, are identified. The main problems associated with triangulation techniques, those of target ghosts and ghost resolution in denser scenarios, are discussed and trilateration processing using correlation offered as a solution. The main feature of an operational PJL system is noted as being the need to positively resolve jammer positions, to sub-beam accuracy, in dense jamming scenarios. This includes the 'pop-up' target appearing over the radar horizon and the agile sophisticated jammer. In addition a number of other features are identified which would be desirable in any future NATO PJL system. Over a number of years the UK MoD and GEC-Marconi have undertaken a number of studies relating to PJL architectures and data processing techniques. In 1991 these studies led to the Air Defence Emitter Location Equipment (ADELE) Technology Demonstrator. The objectives of the ADELE program are to demonstrate that the requirements of a PJL system can be met at a price affordable by AD system procurers. Additionally to confirm that the new PJL data processing techniques, developed during these previous studies, perform as predicted during live trials. The main hardware and software modules making up the ADELE demonstrator are discussed including: the multi beam antenna, the resistive matrix beam former, the PJL multi-channel signal sampling hardware, radar interfaces and synchronization, signal and data processing, display and recording, and simulation resources.

A year long experimental program was conducted to measure refractive bending, or how much the signal deviates from true line of sight, at low VHF frequencies (29.5 MHz), and to determine whether this deviation or error could be predicted using large scale ionospheric models such as the Ionospheric Conductivity and Electron Density (ICED) program. An experiment to directly measure the angle of arrival of a 29.5 MHz signal from an orbiting satellite was successfully completed. The satellite was in a circular orbit at an altitude of 1000 km. It was shown that refractive errors can be directly related to the electron density along the measurement slant range. Ionospheric disturbances such as sporadic E and ionospheric storms produce large, short term errors that can approach 10 degrees. In addition to day/night variations, seasonal and solar cycle sensitivities were found. The refractive error varied so' rapidly with respect to time and space that its prediction with a median value ionospheric code is almost impossible. Author

Strong gradients in electron density associated with sunrise and sunset are a well known feature of the ionosphere and will produce off great circle bearings, particularly if the propagation path is parallel to the dawn or dusk terminator. Measurements were undertaken of the direction of arrival of signals in the range 3 to 23 MHz radiated by a transmitter located at Clyde River in the Canadian Arctic (70 deg N, 70 deg W). The path from this transmitter to the receiving site at Boston, USA, is parallel to the dawn dusk line and consequently systematic changes in bearings are expected to occur. Bearings measured during January 1989 indicate a positive error of a few degrees at around sunrise. As the day progressed the error decreased, becoming zero at local noon at the path mid point. As the dusk approaches, the tilts in the ionosphere are reversed in gradient and there is a smaller negative swing in the mean bearing. The bearing error at dusk is smaller than at sunrise since the ionospheric gradients at this time are less steep. The diurnal swing in the bearing occurs during the winter and equinox periods but is absent (or very small) during summer. This is because the ionospheric gradients in summer are smaller than those at other seasons due to the relatively low values of the F-region critical frequency (foF2) which occur during the summer daytime. It is well known that the auroral zone ionosphere contains steep time varying gradients in electron density which can produce large off-great circle bearings in the direction of arrival of HF radio signals reflected from this region of the ionosphere. Recent DF measurements at a high latitude site indicate that large bearing errors are also observed in signals reflected from the polar cap ionosphere which is generally regarded as being a much less disturbed region than the auroral zone. A feature of these measurements is a large (+ or - 50 deg) quasi-periodic swing in the direction of arrival observed for both short and long propagation paths. These changes in angle of arrival are attributed to reflection from patches or 'blobs' of over-dense plasma which travel with the convection current flow across the polar cap region from dayside to nightside. The periods of large bearing swings are well correlated with the onset of magnetic activity as measured by the Kp index. Author (revised)

The performance of high frequency (HF) direction finding systems is related to the mode content of the received signal and to the signal frequency. In order to fully investigate this effect, an experiment was devised to measure the direction of arrival of oblique ionospheric sounding signals emitted by the worldwide network of BR Communications chirp sounders. These signals are radiated as a constant sweep chirp signal from 2 to 16 or 30 MHz thus enabling the DF performance to be measured over the full range of frequencies propagating from the chosen transmitter. Simultaneous oblique ionograms are also recorded for the paths of interest in order to determine the mode structure at any frequency. Preliminary tests of the system were undertaken at Ottawa, Canada and Cheltenham, UK with the directions of arrival measured by a wide aperture goniometric DF system. Several interesting features were identified in these measurements. A further measurement campaign was conducted during Apr. 1992 at Alert, a very high latitude site in the Canadian Arctic where very large bearing errors and systematic bearing swings, sometimes in excess of + or - 50 deg, are known to occur. A computer based model of an automated wide aperture goniometric HF direction finder (type DF6) was developed to investigate the system performance under various simulated signal environments. Several test runs of the model indicated that the original DF6 algorithm could be modified to yield a significant improvement in the measured bearing accuracy and in addition provide a meaningful indication of the quality of the measured bearing. These modifications were implemented and tested at two sites in Canada. A system located in Ottawa was tasked against known transmissions from Halifax, Nova Scotia (950 km) and several hours of data collected. These measurements confirmed that the changes implemented as a result of the computer modeling produced improved bearing measurements. Further tests were conducted at Alert, a very high latitude site in the Canadian Arctic. At this site, the bearings often varied rapidly by several tens of degrees. These latter observations indicated that further changes to the DF algorithm should be made for systems deployed at this high latitude sight. Author

Skywave signals in the HF band experience a plethora of effects which distort them in the time, space, and spectral domains. The ability of a particular measurement to resolve discrete components which faithfully represent a single signal source (i.e., useful for angle-of-arrival estimation) is a somewhat random occurrence given any one fixed integration time. However, the fact that the signal components can be resolved in the spectral domain by our Doppler technique much of the time seems to indicate that there are indeed a finite number of discrete components in any sky wave signal and that the Doppler shift for each component varies independently such that they may be resolvable in the spectral domain. UTILIZATION OF A RECEPTION NETWORK OF THE LOSQUET ISLAND RETRODIFFUSION PROBE IN RADIOGONIOMETRY [UTLISATION DU RESEAU DE RECEPTION DU SONDEUR A RETRODIFFUSION DE L'ILE LOSQUET EN RADIOGONIOMETRIE]

J. Y. LeSaout, F. Gauthier, N. Ruelle, and R. Fleury *In* AGARD, Radiolocation Techniques Nov. 1992 11 p In FRENCH (For primary document see N93-23598 08-32)

Copyright Avail: CASI HC A03/MF A03

The method of radiogoniometry from a single sensor operating from the Losquet Island retrodiffusion probe is described. The experimental results of the determination of the azimuth and the elevation of the waves having transitioned through the ionosphere, obtained by well-located emitters, are presented. The measured angles are compared to the results from a propagation model and to the arrival directions calculated by an oblique transposition of vertical ionograms. It is shown that the azimuth in which the emitter is found can be determined with a precision which is that of the accuracy of the measurement, and at elevation, the method allows the measurement of the angles associated with the dominant trajectories even if their performances are limited in the presence of multitrajectories.

The Advanced Translator Processing System was developed to provide a low cost alternative to tracking translated GPS signals. It is backwards compatible with the Translator Processing System (TPS) currently used to track Ballistic Missile Translators (BMT) by the US Ranges. NAVSYS has also developed a BMT compatible Translator. A key element of the ATPS is the Preamplifier/Downconvertor (P/DC) module which was developed by NAVSYS to condition the received Translator signal so it can be tracked with a conventional C/A code receiver. This significantly reduces the cost of the hardware by allowing the ATPS to be constructed mostly from off-the-shelf components. The ATPS and Translator were tested against the RAJPO Ballistic Missile and Translator Processing System Specifications. This paper presents the results of tests demonstrating the performance of the ATPS and Translator under different operating conditions. NAVSYS has also developed a Post Test Processing System (PTPS), incorporating the same components, which records the Translator data during the tests. When this data is played back, high-accuracy Time and Space Position <iformation (TSPI) data can be computed on the vehicle even under extreme dynamics. Author

Modern defense systems depend on comprehensive surveillance capability. The ability to detect and locate the radio signals is a major element of a surveillance system. With the increasing need for more mobile surveillance systems in conjunction with the rapid deployment of forces and the advent of technology allowing more enhanced use of small aperture systems, tactical direction finding (DF) and radiolocation systems will have to be operated in diverse operational conditions. A quick assessment of the error levels expected and the evaluation of the reliability of the fixes on the targeted areas bears crucial importance to the effectiveness of the missions relying on DF data. This paper presents a sophisticated, graphics workstation based computer tool developed for the system level analysis of radio communication systems and describes its use in radiolocation applications for realizing such accurate and realistic assessments with substantial money and time savings. The rapid expansion of telecommunication has practically saturated every band of Radio Frequency Spectrum; a similar expansion of electrical and electronic devices has affected all radio communications which are, in some way, influenced by a large amount of interferences, either intentionally or unintentionally produced. Operational consequences of these interferences, particularly in the frequency channels used for aeronautical services, can be extremely dangerous, making mandatory a tight control of Electromagnetic Spectrum. The present paper analyzes the requirements and the problems related to the surveillance, for civil application, of the Electromagnetic Spectrum between 20 and 1000 MHz, with particular attention to the detection and location of radio interference sources; after a brief introduction and the indication of the advantages of an airborne versus ground installation, the airborne system designed by Alenia in cooperation with Italian Ministry of Post and Telecommunication, its practical implementation and the prototype installation on board of a small twin turboprop aircraft for experimentation purposes is presented. The results of the flight tests are also analyzed and discussed. Author (revised)

LOCALIZATION SYSTEM BASED ON DATA MERGING OF IMAGES AND INERTIA

J. Y. Cartoux, G. Sella, L. Agranier, T. Pechoux, and G. Grenier *In* AGARD, Radiolocation Techniques Nov. 1992 4 p (For primary document see N93-23598 08-32)

Copyright Avail: CASI HC A01/MF A03

The accuracy which is now required in the target approach of the modern missiles, requires the use of several sensors. Inertial systems, GPS when available, and imaging sensors are combined to improve the overall accuracy by the means of filtering and data merging techniques. Several tasks can be realized by the imaging system: targets detection and identification, missile position and motion estimation. The resulting information will be used as command parameters under certain conditions of robustness and accuracy. Our goal is not only to compute these parameters but to specify their domain of usability. Our approach is based on the development of a global simulator. The models of the inertial systems, the information computed by the imaging sensors are combined in a global Kalman filter scheme. The goal is to provide the user with the ability of studying the sensibility of the vision algorithms to some system parameters and external conditions in order to get the best overall accuracy. In the first part of this paper, we present the Kalman filter scheme and the issues involved. In the second chapter, the data that can be obtained from imaging techniques and the associated treatments are presented. We specify what are the constraints and the conditions under which these data can be obtained and study their sensibility to some system parameters. Author (revised)

The complexity of the arrays is directly tied to the number of antennas of which they are composed. The laws of radiation in the far field are well known and are inferred from the law of illumination of the antenna. The worry of the inventor is, as always, to determine, for a number of possible antennas, their spatial partition which assures the most advantageous law of radiation. The electronic orientation of the lobe of the antenna and the functioning within a wide band makes the problem more complex. The desire to obtain a lobe of narrow principal radiation and to limit the amplitude of secondary lobes is always contradictory. Regular structures used fix the characteristics of the diagrams of radiation in which the variations which obey the known laws are less favorable than the optimization of the

diagrams. Aleatory structures can be used, but the correct results are not obtained until after multiple attempts, without which it is possible to be assured that the solution kept is the best. Fractal structures give results which one knows determine, a priori, the characteristics. Certain structures take particularly well to the construction of antennas and permit the best adjustment to finesse the principal lobe and remount the secondary lobes. Particular fractal themes permit the regulation of the problems of arrays in 1, 2 or 3 dimensional space. The fractal structures can be obtained by deterministic processes but also by the introduction of aleatory fluctuations around the deterministic model, which result in pseudo-aleatory fractal structures, or models built by totally aleatory processes which result in fractal aleatory models. Copyright Avail: CASI HC A02/MF A03

The use of techniques of transmission by evasion of frequency or gusts in VUHF in order to fight against conventional ECM systems is more and more widespread. The appearance of rapid goniometric sensors makes the interception and goniometry of these signals possible. The localization of these signals by a conventional system requires that the emission be set on standby. In order to avoid this problem, a system of extraction of the emissions with evasion of frequency and gusts with goniometry before localization is proposed, this being carried out on 'synthetic' emissions calculated from goniometric detections. The calculation of these 'synthetic' emissions requires an algorithm allowing the reconnaissance and the identification of the types of emissions. Beginning with the reconnaissance carried out on several goniometers, emitters are sought which have the same characteristics on the various sensors before carrying out localization by the Cartesian least squares method. Copyright Avail: CASI HC A02/MF A03

In this work, a new algorithm for multiple emitter direction finding for circular arrays is proposed. The algorithm uses a single snapshot for processing. The observation is first transformed into frequency domain. Then, by using the Fourier series coefficients of pattern of the sensors, it is transformed into a suitable sequence. The linear prediction method is applied to the resulting sequence to determine the direction of arrivals from the zeros of corresponding linear prediction filter. An iterative correction scheme is used to improve the accuracy of the estimates. Computer simulations have been performed to evaluate the performance of the algorithm. It has been observed that the algorithm operates successfully if the array circumference is comparable to the wavelength. Author

This paper presents two examples of low level strategies using multi sensor data fusion, one for bridge extraction, and one for urban area extraction. These extractions are made from a couple of coregistered Synthetic Aperture Radar (SAR) and SPOT images. These features are very different by their dimensions, their shape, and their radiometry. Thus we can prove the reliability of our approach on various types of features. Our method uses the notion of complementarity of each sensor, and the notion of context in the observed scene. For bridge detection, we first segment water in the SPOT image, to spatially constrain the bridge research in the SAR image. This research is achieved using a correlation method. To detect an urban area, we first use the knowledge that it produces very bright texture in SAR imagery. Thus, the main part of urban backscatters is extracted using an adaptative thresholding which keeps the upper band of the gray level histogram of the SAR image. This mask is then used for classification as a training mask of urban area texture in SPOT image. We determine the non urban zone training set using a distance map of the urban training zone boundaries. Classification is performed with a multivariate Gaussian classifier. The results we obtained are very encouraging, especially if we consider the robustness of the bridge detection method. Author

DIGITAL PROCESSING FOR POSITIONING WITH ONE SATELLITE
A. Marguinaud *In* AGARD, Radiolocation Techniques Nov. 1992 12 p (For primary document see N93-23598 08-32)
Copyright Avail: CASI HC A03/MF A03

This paper is a product of theoretical and practical work done with geostationary and low earth-orbiting (SARSAT) satellites. Reliability, efficiency and cost considerations have resulted in an all digital implementation with standard processors. The analog signal is represented by complex samples calculated from real sampling with an algorithm based on an original concept. Any telecommunication (or radar) signal is represented by reversible transformations of a sinusoidal carrier. Maximum likelihood synchronization and demodulation must be used and consists of reconstructing the 'best' carrier from the received signal. Depending on the uncertainty level, one tries a certain number of time-frequency hypotheses, and for each hypothesis, one makes optimum estimations of 3 carrier parameters: modulus, phase and frequency. Since one deals with one circular function, it is straightforward to develop the phase, so that phase and frequency are the 2 parameters defining a straight line in the developed phase-time plane. The 2 corresponding estimators are decorrelated. For a terrestrial vehicle, one can have a good estimation of its velocity, and even for a stationary satellite there is an apparent periodical known motion, which can be used to locate the vehicle by a convenient combination of elementary estimations. Of course some frequency spreading, clock stability and delay are necessary, but explicit performance is easy to derive as functions of operational conditions. Analysis of numerical results may suggest useful practical systems. Author

A system for recording Extremely Low Frequency (ELF) noise bursts produced by global lightning activity is described. The location of the source lightning flashes for some 320 such events has been deduced from these data. The range of the sources was found by modelling the data using a least-squares fit to the complex wave impedance obtained from the standard propagation theory applicable to the Earth-ionosphere spherical-shell waveguide. The source bearings were deduced from two orthogonal components of the magnetic field vector using the usual goniometric technique. The source range and bearing serve to locate each

source on the surface of the Earth. The data show that the majority of ELF event sources are located in tropical regions, an average of 7.4 Mm away from the observing station situated at 51.14 degrees North, 1.44 degrees West (Geographic). The use of such a system to monitor worldwide thunderstorm activity, so far as this relates to ELF events has been demonstrated. Author

THE WG SEQUENCES: QUASI PERFECT BINARY SEQUENCES [LES SEQUENCES WG: SEQUENCES BINAIRES QUASI PARFAITES]

C. Goutelard *In* AGARD, Radiolocation Techniques Nov. 1992 19 p In FRENCH (For primary document see N93-23598 08-32)

Copyright Avail: CASI HC A03/MF A03

The research of sequences presenting good periodic correlation functions is a subject on which much research has been focussed over a long time. The binary sequences are of particular interest because of their simplicity of generation and of treatment. The W.G. (Wolfmann-Goutelard) sequences presented in this report possess quasi perfect periodic correlation functions, such that outside of the central pic, these functions are null except at one point. It is shown therefore that the structure of W.G. sequences is unique and that it is the result of the interlacing of three periodic sequences. The properties of these sequences are studied and it is shown that the algorithms of determination reduce the complexity of their research. The conditions for the existence, or nonexistence, of these sequences are given and the existing sequences for the lengths N = 8 alpha + 4, N = 16 alpha + 4, and N = 32 alpha + 4 where alpha belongs to Z are given up to N = 20000. APPLICATION OF COSTAS CODES AND QUADRATIC CONGRUENTIAL CODES TO DIGITAL PULSE COMPRESSION [L'APPLICATION DES CODES DE COSTAS ET DES CODES A CONGRUENCES QUADRATIQUES A LA COMPRESSION D'IMPULSION NUMERIQUE]

Caroline Delisle and Martin Blanchette Dec. 1991 28 p In FRENCH

(DREO-TN-91-31; CTN-93-60664) Avail: CASI HC A03/MF A01

Coded signals are used for pulse compression radars, allowing improvement of resolution and target detection without the need to increase peak emitted power. The random selection of a new code at each transmission allows detection of return signals having the same code as that of the transmitted signal while rejecting any other code. It is important to choose codes so that their autocorrelation function has a tight principal lobe and weak secondary lobes, and that their cross correlation is significantly weaker than their respective autocorrelation. Costas codes and quadratic congruential codes, two types of frequency coding, were studied for their application to digital pulse compression. These codes have the characteristics of producing a thumbtack ambiguity diagram with low sidelobes. Computer simulations were performed to calculate their autocorrelation functions, and the performance of the two codes was compared to that of other well-known codes. Results show that the two codes do not have sidelobes as low as those using the chirp, step-chirp, or pseudorandom codes. The quadratic codes are appropriate for an application requiring a compromise between a good autocorrelation function and a good cross correlation. CISTI

PERFORMANCE ANALYSIS OF THE DOWNLINK DBPSK EHF-SATCOM SYSTEM, PART 1

France Couture and Y. T. Chan Jan. 1991 75 p

(Contract DSS-1410FE62)

(DREO-CR-041LM; CTN-93-60710) Avail: CASI HC A04/MF A01

The downlink phase shift keying system, part of the SATCOM project, was simulated by a computer model. The installation procedure, including data backup and retrieval, for the computer program is presented. Using the SPW (Signal Processing WorkSystem) simulation tool, the performance of the system is evaluated under additive white Gaussian noise, with Rayleigh fading, and with enhancement through coding (notably convolutional encoding and Viterbi decoding) and convolutional interleaving. In the Rayleigh fading simulation, the scintillation effect is introduced into the channel, and the steps used to design the digital filter that introduces this effect are provided. For each simulation, the block diagram of the evaluated system is given as it is used in SPW. Results are compared with theoretical performance and shown graphically. Source file program listings are also included. The main finding is that the simulation results agree with the theoretical and confirm those simulations performed independently by the Raytheon Company, with the exception of soft-decoding phase shift keying, for which both the SPW and Raytheon simulations produce probabilities of error that exceed the theoretical upper bound. IMMUNIZING DIGITAL SYSTEMS AGAINST ELECTROMAGNETIC INTERFERENCE

P. D. Ewing, K. Korsah, and C. Antonescu (Nuclear Regulatory Commission, Washington, DC.) 1993 13 p Presented at the 2nd International Conference on Nnclear Engineering, San Francisco, CA, 21-24 Mar. 1993

(Contract DE-AC05-84OR-21400)

(DE93-005935; CONF-930352-11) Avail: CASI HC A03/MF A01

This paper discusses the development of the technical basis for acceptance criteria applicable to the immunization of digital systems against electromagnetic interference (EMI). The work is sponsored by the US Nuclear Regulatory Commission and stems from the safety-related issues that need to be addressed as a result of the application of digital instrumentation and control systems in nuclear power plants. Designers of digital circuits are incorporating increasingly higher clock frequencies and lower logic level voltages, thereby leading to potentially greater susceptibility of spurious interference being misinterpreted as legitimate logic. Development of the technical basis for acceptance criteria to apply to these digital systems centers around establishing good engineering practices to ensure that sufficient levels of electromagnetic compatibility (EMC) are maintained between the nuclear power plant's electronic and electromechanical systems. First, good EMC design and installation practices are needed to control the emissions from interference sources and thereby their impact on other nearby circuits and systems. Secondly, a test and evaluation program is needed to outline the EMI tests to be performed, the associated test methods to be followed, and adequate test limits to ensure that the circuit or system under test meets the recommended guidelines. Test and evaluation should be followed by periodic maintenance to assess whether the recommended EMI control practices continue to be adhered to as part of the routine operation of the nuclear power plant. By following these steps, the probability of encountering safety-related instrumentation problems associated with EMI will be greatly reduced. DOE

ONE-CLASS CLASSIFIER NETWORKS FOR TARGET RECOGNITION APPLICATIONS

M. M. Moya, M. W. Koch, and L. D. Hostetler 1993 5 p

(Contract DE-AC04-76DP-00789)

(DE93-006288; SAND-93-0084C) Avail: CASI HC A01/MF A01

Target recognition requires the ability to distinguish targets from non-targets, a capability called one-class generalization. Many neural network pattern classifiers fail as one-class classifiers because they use open decision

boundaries. To function as one-class classifier, a neural network must have three types of generalization: within-class, between-class, and out-of-class. We discuss these three types of generalization and identify neural network architectures that meet these requirements. We have applied our one-class classifier ideas to the problem of automatic target recognition in synthetic aperture radar. We have compared three neural network algorithms: Carpenter and Grossberg's algorithmic version of the Adaptive Resonance Theory (ART-2A), Kohonen's Learning Vector Quantization (LVQ), and Reilly and Cooper's Restricted Coulomb Energy network (RCE). The ART 2-A neural network gives the best results, with 100 percent within-class, between-class, and out-of-class generalization. Experiments show that the network's performance is sensitive to vigilance and number of training set presentations. DOE

SCIENTIFIC VISUALIZATION OF VOLUMETRIC RADAR CROSS SECTION DATA M.S. Thesis

Thomas G. Wojszynski Dec. 1992 69 p

(AD-A259586; AFIT/GCS/Eng/92D-21) Avail: CASI HC A04/MF A01

For aircraft design and mission planning, designers, threat analysts, mission planners, and pilots require a Radar Cross Section (RCS) central tendency with its associated distribution about a specified aspect and its relation to a known threat, Historically, RCS data sets have been statically analyzed to evaluate a d profile. However, Scientific Visualization, the application of computer graphics techniques to produce pictures of complex physical phenomena appears to be a more promising tool to interpret this data. This work describes data reduction techniques and a surface rendering algorithm to construct and display a complex polyhedron from adjacent contours of RCS data. Data reduction is accomplished by sectorizing the data and characterizing the statistical properties of the data. Color, lighting, and orientation cues are added to complete the visualization system. The tool may be useful for synthesis, design, and analysis of complex, low observable air vehicles. GRA

REAL-TIME SIGNAL PROCESSING SYSTEMS Final Report, 5 Oct. 1989 - 29 Oct. 1992

Michael Andrews 29 Oct. 1992 374 p

(Contract DAAD07-89-C-0212)

(AD-A259548) Avail: CASI HC A16/MF A03

An Expandable Victor Accelerator (EVA) and its hardware and software capable of processing range and range rate data, digital focus, real-time Kalman filtering, real-time target motion resolution (TMR), and processing image/pattern information for real-time optical trackers of multi-munitions scenes are developed. EVA consists of two major but tightly coupled components, a Vector Processing Hardware (VPH) and a Cascadable Processing Hardware (CPH). VPH is a speed optimized architecture capable of processing vectors of complex data. The architecture is based upon the utilization of multiple Zoran VSP-325 chips. CPH is also a speed optimized. However, the architecture is configured for those applications where the concern for high precision and wide dynamic range is at a premium. CPH hardware utilizes multiple Bipolar Integrated B2110/B2120 and multiple 12x14 CrossBar custom chips. VPH was fabricated, completed and demonstrated successfully as proposed. However, CPH is incomplete with only 70 percent of the design accomplished. The Cross Bar custom chips were fabricated and completed. GRA

DEVELOPMENT OF LASER RADAR ATR ALGORITHM. PHASE 2: MILITARY OBJECTS

Elie Bienenstock, Donald Geman, Stuart Geman, and Donald E. McClure 31 Oct. 1990 67 p

(Contract DAAL02-89-C-0081)

(AD-A237544) Avail: CASI HC A04/MF A01

Under this contract, MTI has developed a software system for the automatic recognition of military targets occurring in laser radar range data. The algorithm is designed to operate over a variety of scenarios: the targets may occur in multiple numbers and aspects, and may be partially occluded due to other vehicles, irregularities in the terrain, or background clutter. The particular algorithm delivered to CNVEO under this contract is configured to detect and classify three particular targets (M35, M60, and M113), but the system is based on very general principles concerning invariant rigid body object recognition and easily extended to additional targets, clutter types, sensor effects, and degrees of freedom in the viewing angles. In fact, an enhancement and special purpose implementation of a generic object recognition system developed at MTI is represented. Initially, this system was developed for the classification of two-dimensional shapes in highly degraded, visible light intensity data; in particular, optical character recognition served as a convenient and challenging prototype problem, and MTI has now developed a commercially viable software product capable of accurate identification of printed characters in noisy and cluttered images, such as high magnification photographs of alphanumeric identifications on silicon wafers. A METHOD FOR SKEW-FREE DISTRIBUTION OF DIGITAL SIGNALS USING MATCHED VARIABLE DELAY LINES

Thomas Knight and Henry Wu Mar. 1992 14 p

(Contract N00014-89-J-3202; NSF MIP-90-01651)

(AD-A260171; AI-M-1282) Avail: CASI HC A03/MF A01

The ability to distribute signals to all parts of a circuit with precisely controlled and known delays is essential in large, high-speed digital systems. We present a technique by which a signal driver can adjust the arrival time of the signal at the end of the wire using a pair of matched variable delay lines. We show how this idea can be implemented requiring no extra wiring, and how it can be extended to distribute signals skew-free to receivers along the signal run as well as the receiving end. We demonstrate how this scheme can be implemented as part of the pad and scan logic of a VLSI chip. GRA

LOG-PERIODIC SLOT ANTENNA Patent

Yung L. Chow, inventor (to Department of National Defence) 25 Feb. 1992 24 p Filed 18 Jan. 1988

(CA-Patent-1-296-421; Int-Patent-Class-H01Q-11/10; CTN-93-60641)

Copyright Avail: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada HC

A log periodic slot antenna is comprised of an array of log periodically spaced, parallel radiating slots of increasing length, and a plurality of coplanar guides, each line connecting one pair of adjacent slots. The coplanar guides are arranged alternately on opposite sides of the center line of the antenna, the connection point with each slot being spaced from the adjacent slot edge by a distance approximately one quarter of the slot length. In a modified version of this antenna, the dimension of the ground plane is of the same order of magnitude as the dimensions of the array whereby the antenna pattern has a null in the forward direction in the plane of the ground plane. In a further modification, two such log periodic slot antennas are arranged with a common vertex and with their ground planes coplanar. An in-phase feed connection for each antenna is arranged such that the cross polarization antenna pattern in the plane of the antenna has a null in the forward direction. This antenna is useful for accurate direction finding. Author (CISTI)

METHOD AND APPARATUS FOR DETERMINING TARGET ELEVATION ANGLE, ALTITUDE AND RANGE, AND THE LIKE IN A MONOPULSE RADAR SYSTEM WITH REDUCED MULTIPATH ERRORS Patent Application

Dean D. Howard, inventor (to Navy) 29 May 1992 30 p

(AD-D015622; US-Patent-Appl-SN-889806; Navy-Case-70889) Avail: CASI HC A03/MF A01

The present invention relates to a method and system for determining target elevation angle, altitude and range and the like in a monopulse radar system with reduced multipath errors. A transmitter/receiver unit receives monopulse sum and difference signals caused by echoes from targets. The sum and difference signals are then logarithmically-amplified in a logarithmic amplifier unit. A selector selects one of the sum and difference signals having the largest amplitude, and generates a selection signal indicating which of the sum and difference signals has the largest amplitude. The selection signal is provided to a search radar target tracking unit which determines whether a target at a given range interval and

azimuth interval, for example, has been selected for tracking by an operator. The search radar target tracking unit then controls a gate unit to selectively provide either the logarithmically-amplified sum signal or the logarithmically-amplified difference signal to a peak detection unit based on the selection signal, and based on whether a particular target has been selected for tracking. A FIGURE OF MERIT FOR TRANSIT-TIME-LIMITED TIME-DERIVATIVE ELECTROMAGNETIC FIELD SENSORS Technical Note
Carl E. Baum Jan. 1993 26 p
(AF Proj. 9993)
(AD-A260016; PL-TN-92-1016) Avail: CASI HC A03/MF A01

This note derives a sensitivity-bandwidth figure of merit for comparing the performance of sensors designed to measure the time derivative of D or B. This figure of merit is a dimensionless number combining sensitivity and upper frequency response (bandwidth) in a form equivalent area times the square of bandwidth. The larger the figure of merit A, the more efficient is the design. This figure of merit is appropriate where sensor size is not a factor, but sensitivity and bandwidth are of primary concern. GRA

N93-24460# Phillips Lab., Kirtland AFB, NM.
THE SINGLE-GAP HOLLOW SPHERICAL DIPOLE IN NON-CONDUCTING MEDIA Technical Note
Carl E. Baum Jan. 1993 72 p
(AF Proj. 9993)
(AD-A260017; PL-TN-92-1019) Avail: CASI HC A04/MF A01

This note considers the response of a hollow spherical dipole in non-conducting media. This sensor is a sphere with a slot around the equator which is uniformly resistively loaded. The current through the resistive load across the slot is proportional to the time rate of change of the displacement vector for low frequencies. The response characteristics of such a device at high frequencies are calculated using expansions in spherical wave functions. These calculations include the dependence of the sensor response on both frequency and the direction of wave incidence. GRA

THE PROCESS OF CONSENSUS ON EMF: SAB REVIEW OF THE EPA DRAFT DOCUMENT ON EMF AND CANCER
B. W. Wilson Jun. 1992 12 p Presented at the Annual Meeting of the Air and Waste Management Association (AWMA), Kansas City, MO, 21-26 Jun. 1992
(Contract DE-AC06-76RL-01830)
(DE93-007183; PNL-SA-21034; CONF-9206114-19) Avail: CASI HC A03/MF A01

The EPA Draft Document on EMF and Cancers grew out of an earlier effort by EPA to track biological effects literature relative to radio-frequency (RF) exposure. Scope of the document was broadened to include extremely low frequency electric and magnetic fields prior to an announcement in 1986 that EPA would formally review the whole area of non-ionizing radiation. An extensive survey of the relevant bioeffects and epidemiologic literature was carried out, and writing on the document began in earnest on the document sometime in 1989. In its draft form, the document reviewed the literature on mechanisms of Interaction between electromagnetic fields and biological tissue, EMF epidemiologic studies, supporting evidence for carcinogenicity and research needs. In the early summer of 1990, a draft of the document was reviewed by some 22 individuals within the EPA and other government agencies. It was also sent out for external review to an additional 9 qualified scientists who had worked in the area and were familiar with EMF-related literature in epidemiology, biology, and physics. Many of the comments sent to EPA from this first review, prior to release of the draft for public comment, were strikingly similar to those resulting from the second (public) review process. Thus, it appears that much of the controversy that was later associated with the document could have been avoided had the authors been diligent in following the recommendations of the initial set of reviewers. ANTENNA PATTERN CONTROL USING IMPEDANCE SURFACES Semiannual Progress Report, 16 Sep. 1992 - 15 Mar. 1993
Constantine A. Balanis and Kefeng Liu 15 Mar. 1993 28 p
(Grant NAG1-1183)
(NASA-CR-192712; NAS 1.26:192712; TRC-EM-CAB-93003) Avail: CASI HC A03/MF A01

A hybrid numerical technique is developed for electrically large pyramidal horn antennas radiating in free space. A stepped-waveguide method is used to analyze the interior surfaces of the horn transition. The Electric Field Integral Equation (EFIE) is employed on the outer surfaces of the pyramidal horn including the radiating aperture. Meanwhile, the Magnetic Field Integral Equation (MFIE) is used on the aperture to relate the aperture fields and those in the horn transition. The resultant hybrid field integral equation (HFIE) is solved numerically by the method of moments. This formulation is both accurate and numerically stable so that high-gain microwave pyramidal horns can be analyzed rigorously. Far-field radiation patterns, both computed and measured, are presented for three electrically-large x-band horn antennas. The comparisons demonstrate that this method is accurate enough to predict the fine pattern structure at wide angles and in the back region. Computed far-field patterns and aperture field distribution of two smaller x-band horns are also presented along with a discussion on the validity of the approximate aperture field distributions routinely used in the analysis and design of pyramidal horns. SUPPRESSION OF POWER LINE HARMONIC INTERFERENCE IN HF SURFACE-WAVE RADAR Technical Report
Hank Leong Oct. 1992 31 p
(AD-A259917; DREO-1137) Avail: CASI HC A03/MF A01

Experimental data of the Cape Bonavista High-Frequency Surface-Wave

Radar (HFSWR) Facility was contaminated by power line harmonics. The harmonics modulate the radar signal (mainly sea clutter) and replicate it into the Doppler spectrum. The spectral replicas distort the noise and sea clutter statistics in the signal. It is necessary to suppress them before the statistics can be obtained. A new process based on optimizations is presented for suppressing the interference. This process minimizes the spectral power of the sea clutter with respect to the amplitudes and phases of the harmonics. It is capable of removing the spectral replicas without adversely altering the statistics. This process, however, requires adequate modeling of the harmonics. A large number of parameters are required because the harmonics may have a fluctuating fundamental frequency and fluctuating amplitudes. Therefore, the process can be numerically complex. To implement our process, one must use approximations in the signal model. If the amplitudes and the fundamental frequency are approximated with constants, the process can still be effective for a short HFSWR data series. For some 256-point data series, more than 20 dB of the peak interference can be reduced. For a long HFSWR data series, the same process can be applied by first dividing it into several short data segments, and then optimizing on the individual segments. With this slightly revised approach, up to 20 dB of the peak interference can be suppressed for a long data series. GRA

A LOW-DELAY BACKWARD-ADAPTIVE CELP SPEECH CODER M.S. Thesis

Leonardo G. Neumeyer Ottawa, Ontario Carleton Univ. Aug. 1990 110 p

(ISBN-0-315-60461-1; CTN-93-60655) Copyright Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, J8X 3X2, Canada, HC

The latest techniques used in code-excited linear prediction (CELP) coders are examined in order to simulate a complete design of a digital coding system for voice communication applications. The focus of the research is on investigating the feasibility of modifying the conventional CELP structure to achieve shorter encoding delays. Different aspects of a CELP coder design at bit rates of 8 Kb/s are investigated and a complete design procedure is presented. A modification of the original CELP configuration is introduced which reduces the encoding delay by 80 percent by using a backward adaptive short-term predictor. To control filter tracking, a novel mixed distortion measure is proposed. This distortion mixes noise-weighted mean squared error with the log-likelihood distortion measure. Formal listening tests, based on mean opinion score measure, have shown that speech quality in the proposed and conventional coders are very similar. Author (CISTI)

SCATTERING CENTRE ANALYSIS OF SIMPLE METALLIC OBJECTS

Ulrich Fuchs (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Oberpfaffenhofen, Germany.) Sep. 1992 209 p Transl. into ENGLISH of Streuzentrenanalyse in derMikrovellenabbildung einfacher metallischer Streukoerper Original language document was announced as N91-16216 (ESA-TT-1250; DLR-FB-90-32; ETN-93-93516) Avail: CASI HC A10/MF A03; original German version available from DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

Measurements of the complex signal backscattered by metallic cubes, plates, cylinders, and combinations of these objects, are reported. The measurements are employed to generate microwave images which typically exhibit only a few intensity maxima, so called scattering centers. Methods for analyzing the dependence of the corresponding scattering mechanisms in frequency, aspect angle and polarization, are developed. Interpretations of the experimental results are compared with model calculations on the basis of the geometrical theory of diffraction. ESA

OPTIMUM SPACE-TIME PROCESSING IN NON-STATIONARY ENVIRONMENTS Ph.D. Thesis

Benoit Champagne Toronto, Ontario Univ. of Toronto 1990 165 p

(ISBN-0-315-56985-9; CTN-93-60656) Copyright Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada, HC

A structural analysis is made of the LLP (space-time log-likelihood processor) that applies to arbitrary signal transmission models comprising N sources, M sensors, a time varying linear channel, and non-stationary Gaussian signal and noise processes. The main results are factorization properties satisfied by the solutions of the classical M-dimensional integral equations defining the LLP. As a consequence of these properties, the LLP can be decomposed in a cascade of three specialized sub-processors. In one application of these structural results, a solution to the problem of exact maximum likelihood (EML) time delay estimation for short observation intervals is obtained. The resulting EML instrumentation consists of a delay-and-sum beamformer followed by a post-processor. Computer simulations show that EML can lead to significant improvement in performance compared to the conventional maximum likelihood estimator. In a second application, the general problem of source parameter estimation for multiple sources monitored through a slowly varying linear channel is solved by introducing a new class of slowly varying linear systems. Closed form expressions are obtained for the LLP and the lower bound on estimator variance. These general results are applied to the problem of time-varying delay estimation in the presence of directional interference.

VERSATILE REED-SOLOMON DECODERS Ph.D. Thesis

Yousef Rajableh-Shayan Montreal, Quebec Concordia Univ. Aug. 1990 173 p

(ISBN-0-315-64738-8; CTN-93-60644) Copyright Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada, HC

Reed-Solomon (RS) codes have found many applications such as space and mobile communication due to their error correcting capability (ECC) and optimum structure. It is shown that time domain algorithms are the best candidates for designing versatile hardware decoders, but syndrome based algorithms are advantageous for software decoders. The algorithms for decoding RS codes require algebraic operations over Galois fields. Parallel in, parallel out multipliers and inverters in Galois fields are considered and least complex structures for the multiplier are introduced. A new normal basis multiplier is presented, as well as a universal multiplier for multiplying two elements of Galois field 2 to the m (m=4,5,6,7,8). The time domain algorithm based on transform decoder is restructured and two versatile decoder structures are presented. Both are simple and modular, thus suitable for very large scale integration design, and can be used for decoding any primitive RS code defined in a specific Galois field. The ECC of these decoders is configurable. The structure of a universal RS decoder is also presented. The time domain decoding algorithm based on algebraic decoder is modified to reduce the complexity of the universal decoder. The ECC and the size for the Galois field of this decoder are configurable. A method is also introduced for decoding RS codes generated by any generator polynomial. Author (CISTI)

SIMULATION OF A NC-FSK MAXIMUM LIKELIHOOD RECEIVER FOR FAST RAYLEIGH FADING M.S. Thesis

Robin D. Addison Ottawa, Ontario Carleton Univ. 21 Dec. 1989 123 p

(ISBN-0-315-59024-6; CTN-93-60649) Copyright Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada, HC

The theory for detection of noncoherent frequency shift keying (NC-FSK) transmitted over a Rayleigh fading channel, such as in mobile and satellite communications, is introduced. Both conventional noncoherent detection and the maximum likelihood detection scheme are described. As an example of the latter, a Gaussian detector is introduced and developed into a general Gaussian receiver and then into the linear predictive receiver (LPR). These maximum likelihood detectors are compared for complexity versus performance and are examined in the two extremes of very slow and very fast fading. Simulation results are provided which characterize the conventional NC-FSK and the LPR. Binary FSK results are presented for various signal to noise ratios and fading bandwidths. These are compared to the analytical results and to those of conventional NC-FSK. M-ary FSM results are then presented. The sensitivity of the receiver to channel

parameter estimation errors was investigated by simulation and the results are shown for errors in fading bandwidth and signal to noise estimates. Simulation results for a reduced complexity version of the LPR are also presented. The effects of different channel models on simulation results are examined and the LPR performance in fast fading is compared to that of conventional diversity schemes in slow fading conditions.

The mission of the Midwest Superconductivity Consortium, MISCON, is to advance the science and understanding of high Tc superconductivity. Programmatic research focuses upon key materials-related problems; principally, synthesis and processing and properties limiting transport phenomena. During the past year, 26 projects produced over 133 talks and 113 publications. Two Master's Degrees and one Ph.D. were granted to students working on MISCON projects. Group activities and interactions involved two MISCON group meetings (held in July and January), twenty external speakers, 36 collaborations, 10 exchanges of samples and/or measurements, and one (1) gift of equipment from industry. Research achievements this past year expanded our understanding of processing phenomena on structure property interrelationships and the fundamental nature of transport properties in high-temperature superconductors. (DE93-003812; LA-UR-92-3649; CONF-921133-6) Avail: CASI HC A02/MF A01

A plasma flow switch (PFS) based on an experimental design utilized at the Air Force Weapons Laboratory (AFWL) was fielded on the Pegasus I system. Currents of as much as 5.8 MA were switched on a time scale (10-90 percent) of 200 ns into a static load. Tests with a foil load resulted in a less than ideal current transfer because of interaction between the dynamic load and the plasma flow switch. Two-dimensional radiation magnetohydrodynamic (RMHD) calculations were used to characterize the behavior of the PFS and to aid in the design. These calculations were also used to investigate several classes of perturbations in the switch-plasma, the interaction of the switch-plasma with the coaxial electrodes, and their effect on switching efficiency. The Pegasus I PFS experiments reproduce the results obtained at AFWL throughout the switch initiation and switching

phases. However, early in the foil implosion the switched current drops significantly. We believe this current drop results from a small amount of residual plasma left behind in the PFS region that impedes the magnetic-flux transport, thereby preventing efficient foil implosion. The experimental results suggest that the method of PFS initiation (viz. chordal wire arrays) may be an important factor in switch operation. DOE

A HIGH-POWER 95 GHz GYRO-TWT AMPLIFIER

K. E. Kreischer, M. Basten, M. Blank, B. G. Danly, W. C. Guss, and R. J. Temkin Jul. 1992 55 p

(Contract DE-AC02-78ET-51013)

(DE93-002332; PFC/RR-92-11) Avail: CASI HC A04/MF A01

The need for radar systems with greater resolution has led to renewed interest in the development of efficient high-power amplifiers at 95 GHz. The gyro-TWT is capable of producing high power with the added attraction of having lower ohmic loading on the smooth fast-wave interaction circuit than conventional slow-wave sources. We have completed a comprehensive design of a 95 GHz gyro-TWT amplifier that is capable of producing 120 kW of output power with an efficiency of 30 percent. a saturated gain of 38 dB, and an instantaneous bandwidth of over 5 GHz. Our concept uses an annular beam produced by a MIG electron source and operates in the TE(sub 5,1) cylindrical waveguide mode. Realistic beam parameters from gun simulations were, included in our efficiency calculations. In addition, our design includes the use of a compact superconducting magnet, quasi-optical input and output couplers and a sever to suppress oscillations. The overall mechanical design shows that a compact, lightweight amplifier with adequate beam clearance is possible. This report also includes a study of a gyro-TWT using a solid on-axis beam from a Pierce-wiggler electron source coupling with a TE(sub 1,eta) waveguide mode. Nonlinear models indicated that an efficient interaction with the waveguide mode was possible, however, beam simulations indicated that the high current density beam had large internal space charge forces that caused a substantial degradation of the beam quality. DOE

TRACEABILITY FOR RADIO FREQUENCY COAXIAL LINE STANDARDS

J. P. Ide Jul. 1992 62 p

(NPL-DES-114; ETN-93-93546) Copyright Avail: National Physical Lab., Teddington, Middlesex, TW11 0LW, England

A study on the traceability of air gauging is presented. Air gauging is a technique for determining the physical dimensions of an item by using the flow rate of air as a measure of the gap between the measurement head and the item. It allows fast and accurate measurement of the internal or external dimensions of items without physical contact. The techniques and the factors that determine the theoretical limits to the accuracy of this method are examined. A practical air gauging system is described and the uncertainties ensuing from using such a system to provide traceability for the national standards of impedance for RF and microwave coaxial items are examined. Calibration and measurement procedures to ensure that the integrity of the measurements is maintained are concluded. ESA

AN EXPERIMENTAL INVESTIGATION OF HIGH TEMPERATURE SUPERCONDUCTING MICROSTRIP ANTENNAS AT K- AND Ka-BAND FREQUENCIES Ph.D. Thesis Final Report

Mark A. Richard Mar. 1993 241 p

(Contract NCC3-99; RTOP 506-72-1B)

(NASA-CR-191089; E-7645; NAS 1.26:191089) Avail: CASI HC A11/MF A03

The recent discovery of high temperature superconductors (HTS) has generated a substantial amount of interest in microstrip antenna applications. However, the high permittivity of substrates compatible with HTS results in narrow bandwidths and high patch edge impedances of such antennas. To investigate the performance of superconducting microstrip antennas, three antenna architectures at K and Ka-band frequencies are examined. Superconducting microstrip antennas that are directly coupled, gap coupled, and electromagnetically coupled to a microstrip transmission line were designed and fabricated on lanthanum aluminate substrates using YBa2Cu3O7 superconducting thin films. For each architecture, a single patch antenna and a four element array were fabricated. Measurements from these antennas, including input impedance, bandwidth, patterns, efficiency, and gain are presented. The measured results show usable antennas can be constructed using any of the architectures. All architectures show excellent gain characteristics, with less than 2 dB of total loss in the four element arrays. Although the direct and gap coupled antennas are the simplest antennas to design and fabricate, they suffer from narrow bandwidths. The electromagnetically coupled antenna, on the other hand, allows the flexibility of using a low permittivity substrate for the patch radiator, while using HTS for the feed network, thus increasing the bandwidth while effectively utilizing the low loss properties of HTS. Each antenna investigated in this research is the first of its kind reported.

SPACE POWER AMPLIFICATION WITH ACTIVE LINEARLY TAPERED SLOT ANTENNA ARRAY

Rainee N. Simons and Richard Q. Lee (National Aeronautics and Space Administration. Lewis Research Center, Cleveland, OH.) Cleveland, OH Jun. 1993 6 p Prepared for presentation at the International Microwave Symposium-MTT '93, Atlanta, GA, 14-18 Jun. 1993; sponsored by the IEEE

(RTOP 506-44-2C)

(NASA-TM-106036; E-7604; NAS 1.15:106036) Avail: CASI HC A02/MF A01

A space power amplifier composed of active linearly tapered slot antennas (LTSA's) has been demonstrated and shown to have a gain of 30 dB at 20 GHz. In each of the antenna elements, a GaAs monolithic microwave integrated circuit (MMIC) three-stage power amplifier is integrated with two LTSA's. The LTSA and the MMIC power amplifier has a gain of 11 dB and power added efficiency of 14 percent respectively. The design is suitable for constructing a large array using monolithic integration techniques. Author

LOW-VOLTAGE-SWING CMOS TRANSCEIVERS

G. Vanstraelen and J. Dorenbosch Dec. 1992 13 p

(Contract DE-AC35-89ER-40486)

(DE93-006607; SSCL-608) Avail: CASI HC A03/MF A01

This report gives a brief overview of two new transceiver techniques. The emphasis is on low power dissipation and low noise. Because commonly used techniques such as Emitter Coupled Logic (ECL) and Back Plane Transceiver Logic (BTL) are known to have a high power dissipation, they are not discussed in this article. Instead, two new techniques, named Gunning Transceiver Logic (GTL) and Double Domino Transceiver Logic (D(exp 2)TL) will be discussed in detail. DOE

DE HAAS VAN ALPHEN EFFECT IN SUPERCONDUCTORS IN MEGAGAUSS FIELDS

C. M. Fowler, B. L. Freeman, W. L. Hults, J. C. King, F. M. Mueller, and J. L. Smith 1992 10 p Presented at the 6th International Conference on Megagauss Magnetic Field Generation and Related Topics, Albuquerque, NM, 9-12 Nov. 1992

(Contract W-7405-eng-36)

(DE93-005465; LA-UR-92-4351; CONF-921133-14) Avail: CASI HC A02/MF A01

The de Haas van Alphen effect was investigated in YBCO recently by Fowler et al. using 100 Tesla fields and temperatures below 4.2 Kelvin. It is concluded that even at these fields these measurements were taken below the superconducting critical field, Bc2. Mixed state quantal oscillatory phonmena have been seen by Graebner and Robins in NbSe2 in 1976 and more recently by Mueller, Lowndes, and Arko et al. in V3Si in lower fields. The implication of such mixed state experiments is discussed. DOE

UTILITY BATTERY STORAGE SYSTEMS PROGRAM REPORT FOR FY 1992
P. C. Butler Jan. 1993 115 p
(Contract DE-AC04-76DP-00789)
(DE93-006459; SAND-92-2272) Avail: CASI HC A06/MF A02

This report documents the fiscal year 1992 activities of the, Utility Battery Storage Systems Program (UBS) of the US Department of Energy (DOE), Office of Energy Management (OEM). The UBS program is conducted by Sandia National Laboratories (SNL). UBS is responsible for the engineering development of integrated battery systems for use in utility-energy-storage (UES) and other stationary applications. Development is accomplished primarily through cost-shared contracts with industrial organizations. An important part of the development process is the identification, analysis, and characterization of attractive UES applications. UBS is organized into five projects: Utility Battery Systems Analyses; Battery Systems Engineering; Zinc/Bromine; Sodium/Sulfur; Supplemental Evaluations and Field Tests. The results of the Utility Systems Analyses are used to identify several utility-based applications for which battery storage can effectively solve existing problems. The results will also specify the engineering requirements for widespread applications and motivate and define needed field evaluations of full-size battery systems. DOE

A SOLENOID WITH A LOW INPUT POWER AND A FAST SWITCHING TIME [EIN ELEKTROMAGNET MIT GERINGEM LEISTUNGSBEDARF UND KURZER SCHALTZEIT]
Guenther Au Oct. 1991 90 p In GERMAN
(DLR-FB-91-39; ETN-93-91928) Avail: CASI HC A05/MF A01; DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

A solenoid was investigated experimentally, and the results were compared with those from theoretical investigations. Besides mechanical construction of the solenoid, the coil must be given great importance. Number of turns, ohmic resistance, self inductivity, and applied DC voltage must be chosen in such an order of magnitude that the other parameters like overall current and voltage drop at the coil will result in a saturation induction, which is compatible with the B, and H characteristics of magnetic materials. Since relatively simple construction is the final goal, industrial serial production will have no problems combined with relatively low costs. ESA

UTILIZATION CRITERIA OF RAPID DISCONNECTABLE POWER SEMICONDUCTORS IN QUASI RESONANT INVERTERS Ph.D. Thesis [EINSATZKRITERIEN SCHNELLER ABSCHALTBARER LEISTUNGSHALBLEITER IN QUASIRESONANZ-UMRICHTERN]
Christian Keller 1991 148 p In GERMAN
(ETN-93-93421) Avail: CASI HC A07/MF A02

The utilization conditions and the behavior of Metal Oxide Semiconductor Field Effect Transistor (MOSFET) and Isolated Gate Bipolar Transistor (IGBT) power semiconductors are examined in quasi-resonant applications. The various concepts of resonant inverter circuits are explained. The examinations of disconnectable advantages over MOSFET are described. A thermal power measuring process is designed, which allows determination of the mean dissipation with a lower measuring uncertainty than when using an oscilloscope. Examinations show that a distinct unloading can be reached for the currently available punch through IGBT of the second generation, by zero current resonance wiring, allowing a decrease in the circuit loss energy by 20 percent with regard to conventional switch operation. CURRENT DISPLACEMENT IN PARABOLIC CYLINDER Ph.D. Thesis [STROMVERDRAENGUNG IM PARABOLISCHEN ZYLINDER]
Gerard Birenbaum 1992 131 p In GERMAN
(ETN-93-93423) Avail: CASI HC A07/MF A02

The eddy current distribution in a conducting parabolic cylinder is determined by two different analytical processes, according to which the source free, z directed vector potential is split up into two independent boundary value problems of the stationary skin effect. In the first analytical processs, a perfectly conductive screen is introduced, which forces Fourier series in the orthogonal direction with still unknown complex coefficients. In the second analytical process, the screen is abandoned, and the potentials in nonconductive space are represented by Fourier integrals. The distribution of eddy currents in the parabolic cylinder at determined times and various frequencies is perfectly explained by the field configurations. ESA

Operation of manipulator systems in poorly defined work environments often presents a significant hazard to both the robotic assembly and the environment. In applications relating to the Environmental Restoration and Waste Management (ER&WM) Program, many of the environments are considered hazardous, both, in the structure and composition of the environment. Use of a sensing system that provides information to the manipulator control unit regarding obstacles in close proximity will provide protection against collisions. A hierarchical design and implementation of a whole-arm obstacle avoidance system is presented. The system is based on capacitive sensors configured as bracelets for proximity sensing. Each bracelet contains a number of sensor nodes and a processor for sensor node control and readout, and communications with a higher level host, common to all bracelets. The host controls the entire sensing network and communicates proximity information to the manipulator controller. The overall architecture of this system is discussed with detail on the individual system modules. Details of an application specific integrated circuit (ASIC) designed to implement the sensor node electronics are presented. Justifications for the general measurement methods and associated implementation are discussed. Additionally, the current state of development including measured data is presented. DOE

SAFETY AND PERFORMANCE OF A LONG LIFE LITHIUM-THIONYL CHLORIDE BATTERY
W. R. Cieslak and H. K. Street 1992 7 p Presented at the 8th Annual Battery Conference on Applications and Advances, Long Beach, CA, 12-14 Jan. 1993
(Contract DE-AC04-76DP-00789)
(DE93-005348; SAND-92-2704C; CONF-930152-3) Avail: CASI HC A02/MF A01

A Li/SOCl2 'D' cell for applications requiring 10 to 15 years life at very low drain rates, typically less than 150 microA, were developed. Maximizing cell safety and reliability, while delivering very good energy density, were the goals. These goals were achieved by designing the cell to be application specific. The low-rate cell was optimized to deliver up to 16 Ah at drain rates of less than 70 mA. By virtue of its low surface area, 145 cm(sup 2), the cell demonstrated excellent safety behavior. Safety testing was performed on individual cells as well as on two-cell and four-cell batteries. Single cells did not vent when short-circuited. Benign venting in a two cell string was produced, but only when the string was partially discharged before shorting. The vent mechanism is a 300 psi rupture pressure burst disc manufactured by BS&B Safety Systems. Benign venting is defined as full opening of the 3/8 in. dia vent hole without deformation of the case. Material is expelled from the cell without flame, and the cell stack remains largely intact. Venting of the Sandia-designed low rate cell was not produced under any other abuse test conditions. The vent functions as an ultimate safety mechanism in the case of severe abuse, but resistance to venting under normal use and mild abuse conditions is key to the achievement of high reliability. DOE

CHARACTERISTICS OF IDENTIFYING LINEAR DYNAMIC MODELS FROM IMPULSE RESPONSE DATA USING PRONY ANALYSIS
D. J. Trudnowski Dec. 1992 97 p
(Contract DE-AC06-76RL-01830)
(DE93-005607; PNL-8450) Avail: CASI HC A05/MF A02

The purpose of the study was to investigate the characteristics of fitting linear dynamic models to the impulse response of oscillatory dynamic systems using Prony analysis. Many dynamic systems exhibit oscillatory responses with multiple modes of oscillations. Although the underlying dynamics of such systems are often nonlinear, it is frequently possible and very useful to represent the system operating about some set point with a linear model. Derivation of such linear models can be done using two basic approaches: model the system using theoretical derivations and some linearization method such as a Taylor series expansion; or use a curve-fitting technique to optimally fit a linear model to specified system response data. Prony analysis belongs to the second class of system modeling because it is a method of fitting a linear model to the impulse response of a dynamic system. Its parallel formulation inherently makes it well suited for fitting models to oscillatory system data. Such oscillatory dynamic effects occur in large synchronous-generator-based power systems in the form of electromechanical oscillations. To study and characterize these oscillatory dynamics, BPA has developed computer codes to analyze system data using Prony analysis. The objective of this study was to develop a highly detailed understanding of the properties of using Prony analysis to fit models to systems with characteristics often encountered in power systems. This understanding was then extended to develop general 'rules-of-thumb' for using Prony analysis. The general characteristics were investigated by performing fits to data from known linear models under controlled conditions. The conditions studied include various mathematical solution techniques, different parent system configurations, and a large variety of underlying noise characteristics. DOE

PULSE POWER REQUIREMENTS FOR LARGE APERTURE OPTICAL SWITCHES BASED ON PLASMA ELECTRODE POCKELS CELLS
M. A. Rhodes and J. Taylor Jun. 1992 5 p Presented at the 20th International Power Modulator Symposium, Myrtle Beach, SC, 23-25 Jun. 1992
(Contract W-7405-eng-48)
(DE93-005824; UCRL-JC-109579; CONF-920671-13) Avail: CASI HC A01/MF A01

We discuss very large-aperture optical switches (greater than 30 x 30

cm) as an enabling technology for inertial confinement fusion drivers based on multipass laser amplifiers. Large-scale laser fusion drivers such as the Nova laser have been based on single-pass amplifier designs in part because of the unavailability of a suitable large-aperture switch. We are developing an optical switch based on a Pockels cell employing plasma-electrodes. A plasma-electrode Pockels cell (PEPC) is a longitudinal-mode Pockels cell in which a plasma discharge is formed on each side of an electro-optic crystal (typically KDP or deuterated KDP, often designated KD*P). The plasmas formed on either side of the crystal act as transparent electrodes for a switching-pulse and are intended to allow uniform charging of the entire crystal. The switching-pulse is a nominally rectangular high-voltage pulse equal to the half-wave voltage V(sub x) (8 kV for KD*P or 17 kV for KDP) and is applied across the crystal via the plasma-electrodes. When the crystal is charged to V(sub x), the polarization of an incoming, linearly polarized, laser beam is rotated by 90 degree. When used in conjunction with an appropriate, passive polarizer, an optical switch is thus realized. A switch with a clear aperture of 37 x 37 cm is now in construction for the Beamlet laser which will serve as a test bed for this switch as well as other technologies required for an advanced NOVA laser design. In this paper, we discuss the unique power electronics requirements of PEPC optical switches. DOE

MONTE CARLO MODELING OF SOLID-STATE PHOTOSWITCHES
P. W. Rambo and J. Denavit Dec. 1992 12 p Presented at the International Society for Optical Engineering Conference, Los Angeles, CA, 18-22 Jan. 1993
(Contract W-7405-eng-48)
(DE93-005829; UCRL-JC-111268; CONF-930159-2) Avail: CASI HC A03/MF A01

Large increases in conductivity induced in GaAs and other semiconductors by photoionization allow fast switching by laser light with applications to pulse-power technology and microwave generation. Experiments have shown that under high-field conditions (10 to 50 kV/cm), conductivity may occur either in the linear mode where it is proportional to the absorbed light, in the 'lock-on' mode, where it persists after termination of the laser pulse or in the avalanche mode where multiple carriers are generated. We have assembled a self-consistent Monte Carlo code to study these phenomena and in particular to model hot electron effects, which are expected to be important at high field strengths. DOE

DESIGN OF LOW-VOLTAGE BIPOLAR OPERATIONAL AMPLIFIERS Ph.D. Thesis
Jeroen Fonderie 1992 207 p
(ISBN-90-9004571-6; ETN-93-93471) Copyright Avail: CASI HC A10/MF A03

The design of input stages for low voltage Operational Amplifiers (OpAmps) is considered. The purpose of this design emanates from the objective of having a common mode input voltage range that reaches from one supply rail to the other, and designs that have this feature both at a 2 V and at a 1 V supply are discussed. Possible output stage configurations are analyzed. This discussion is restricted to output stages that have an output voltage range that also reaches from rail to rail. Further, the output stage should be able to supply a sufficiently large output current to the load that is externally connected to the OpAmp. The frequency response of the output stage is the focus of the discussion. The circuit parts that remain to complete the design of the OpAmp are discussed. These circuit parts are the intermediate stage, inserted between the input and output stage to boost the overall gain of the OpAmp, some implementations of the class AB current control circuit, circuitry to protect the output transistor from heavy saturation and from excessive power consumption, and, finally, the proportional to absolute temperature reference current generator. A detailed analysis of the frequency compensation techniques that can be used to stabilize the OpAmp is given. From this theory, design criteria to successfully implement the compensation method are derived. The experimental OpAmp designs and the measurements performed on these designs are described. Conclusions and suggestions for further research are given. ESA

DESIGN AND QUALIFICATION OF THE SEU/TD RADIATION MONITOR CHIP
Martin G. Buehler, Brent R. Blaes, George A. Soli, Nasser Zamani, and Kenneth A. Hicks 1 Oct. 1992 52 p
(Contract NAS7-918)
(NASA-CR-192797; NAS 1.26:192797; JPL-Publ-92-18) Avail: CASI HC A04/MF A01

This report describes the design, fabrication, and testing of the Single-Event Upset/Total Dose (SEU/TD) Radiation Monitor chip. The Radiation Monitor is scheduled to fly on the Mid-Course Space Experiment Satellite (MSX). The Radiation Monitor chip consists of a custom-designed 4-bit SRAM for heavy ion detection and three MOSFET's for monitoring total dose. In addition the Radiation Monitor chip was tested along with three diagnostic chips: the processor monitor and the reliability and fault chips. These chips revealed the quality of the CMOS fabrication process. The SEU/TD Radiation Monitor chip had an initial functional yield of 94.6 percent. Forty-three (43) SEU SRAM's and 14 Total Dose MOSFET's passed the hermeticity and final electrical tests and were delivered to LL.

PROGRESSES IN MEASURING ELECTROSTATIC DC FIELDS
Frank Buschbeck Apr. 1992 20 p
(OEFZS-4627; ETN-93-93450) Copyright Avail: CASI HC A03/MF A01

Innovations in measurement techniques for electrostatic Direct Current (DC) fields since 1972 are presented. The starting point was the theoretical understanding of the error mechanisms which causes random zeropoint shifts in the conventional DC field meters due to surface pollution. From this theory the basic rule applicable for the design of much more stable measurement devices is derived. The long term instability of these devices is now in the order of only 1 V/m. One particular solution is the 'variable gap fieldmill'. Several vibrating sensor configurations with very low sensitivity to surface pollution are proposed. A general method to improve traditional devices, such as the well known 'covering fieldmill' and some vibrating sensors, is given. For the 'cylindrical fieldmill', a method was developed which allows the simultaneous measurements of field strength, polarity, and the direction to the field source. ESA

AMORPHOUS DIFFUSION BARRIERS FOR ELECTRONIC DEVICE APPLICATIONS Ph.D. Thesis

Pekka Pokela (California Inst. of Tech., Pasadena.) 1991 162 p Sponsored by Suomen Akatemia; Finnish Cultural Foundation; Lohja Corp.; Raakel and Antti Wihuri Foundation; and ARO

(ETN-93-93476) Avail: CASI HC A08/MF A02

Fundamental concepts of producing reliable contacts in silicon technology are overviewed. Diffusion barrier types and their relevant properties are classified and discussed on the basis of the existing knowledge and recent progress. Amorphous binary and ternary nitride diffusion barriers are investigated in a number of silicon contact metallizations and Al/Au thin film couples. The diffusivity as well as the oxidation behavior of these barriers are studied. It is noted that to realize metallurgically stable contacts, the chemical stability of the barrier elements with the adjacent materials and the amorphous structure of the barrier appear as major attributes that, combined, lead to an excellent barrier performance which often exceeds that of conventional diffusion barriers. Based on that idea, a general concept for choosing an optimal diffusion barrier for a given application is presented. Eight appendices are included covering: Si/X/Cu contacts in which both amorphous and crystalline forms of W-N thin films are considered; testing of the effectiveness of the amorphous ternary Ta-Si-N films in various multilayer contacts on silicon by electrical measurements; the investigation of the amorphous Ta-Si-N thin film barrier in the Si/Au and Al/Au contacting schemes; the failure mechanisms in those systems; the determination of relevant properties like diffusivity and oxidation kinetics in amorphous binary W-N and ternary Ta-Si-N diffusion barriers. SIMULATION OF TUNNELADDER TRAVELING-WAVE TUBE COLD-TEST CHARACTERISTICS: IMPLEMENTATION OF THE THREE-DIMENSIONAL, ELECTROMAGNETIC CIRCUIT ANALYSIS CODE MICRO-SOS

Carol L. Kory (Ohio Aerospace Inst., Brook Park.) and Jeffrey D. Wilson Mar. 1993 16 p

(RTOP 506-44-2B)

(NASA-TP-3294; E-7008; NAS 1.60:3294) Avail: CASI HC A03/MF A01

The three-dimensional, electromagnetic circuit analysis code, Micro-SOS, can be used to reduce expensive time-consuming experimental 'cold-testing' of traveling-wave tube (TWT) circuits. The frequency-phase dispersion characteristics and beam interaction impedance of a TunneLadder traveling-wave tube slow-wave structure were simulated using the code. When reasonable dimensional adjustments are made, computer results agree closely with experimental data. Modifications to the circuit geometry that would make the TunneLadder TWT easier to fabricate for higher frequency operation are explored. Author (revised)

(Contract N00014-90-J-1002)

(AD-A259829) Avail: CASI HC A03/MF A01

The finite difference-time domain (FD-TD) technique is applied to the solution of Maxwell's equations. A computer program, which can be used to simulate and study numerous electromagnetic phenomena, is developed and implemented on an IBM 386 compatible personal computer. The FD-TD technique is a useful tool for students in electromagnetics. The technique is flexible and can be applied to many basic EM scattering and radiation problems. Because field solutions are found as a function of time, visualization of the propagation of the EM fields is possible. The FD-TD technique is implemented for a two-dimensional rectangular grid in conjunction with a second-order absorbing boundary condition. Both E- and H-field polarizations are analyzed. Finite objects consisting of dielectric, magnetic and conducting materials, and perfectly conducting infinite ground planes are modeled. Plane wave and line current sources are implemented. In addition to the capability of animating the propagation of the EM fields, radiation and scattering patterns can be generated. GRA

(Contract F08635-90-C-0241)

(AD-A259763; WL-TP-92-012; XC-WL/ELGIN) Avail: CASI HC A03/MF A01

Inductive energy stores have demonstrated higher energy storage densities than capacitive energy stores. A limitation in the use of inductive energy stores has been the availability of adequately rated opening switches. A self-commutated solid-state switch has been developed for use as an opening device for an inductive energy store. A single switch module is rated at 30 kA and 5000 V. The charging pulse lengths for the intended application vary from 0.1 to 5 seconds. Efficiency and volumetric power density were optimized. The switch topology is a two-stage hybrid consisting of an SCR-FET/SCR-IGBT combination. The switch is designed to charge an inductive energy store and repetitively commutate the current to a railgun load. The first of ten switch modules for a 250 kA switch has been built and successfully tested on a battery test stand. The theory of operation, circuit topology, and test results are given in this paper. GRA

STUDY OF A PLASMA-FILLED X-BAND BACKWARD WAVE OSCILLATOR Ph.D. Thesis

Xiaoling Zhai 1992 121 p

Avail: Univ. Microfilms Order No. DA9233705

The plasma-filled Backward Wave Oscillator (BWO) is a very promising but poorly understood high power microwave device. The goal of this experimental investigation was to measure the electric field in a plasma-filled BWO by the spectroscopic analysis of the plasma light emission. The measurement was done directly in the region where the plasma, relativistic electron beam and RF interact. We also hoped to shed some light on how the microwave frequency, power and bandwidth depended on the background plasma density. Our vacuum BWO microwave output was 100 MW at a frequency of 8.5 GHz and bandwidth (delta-f/f(sub 0)) of 6 percent. The efficiency of converting the beam kinetic energy into electromagnetic radiation was 5 percent. When we filled the BWO with background plasma, up to a factor of 7 enhancement in the microwave power output over its vacuum counterpart appeared at a background plasma density of 8 x 10(exp 11) cm(exp -3), with a frequency upshift of 1 GHz and a bandwidth (delta f/f(sub 0)) of 24 percent. Mode switching appeared at a background helium plasma density of 10(exp 12) cm(exp -3). The electric field strength, measured by the Stark shift, peaked at 34 kV/cm and lasted as long as the microwave pulse. Trivelpiece-Gould modes appeared at 2 GHz to 5 GHz in the plasma-filled BWO. Mode competition between the Trivelpiece-Gould mode and the X-band TM(exp 01) mode occurred when the background plasma density was below 6 x 10(exp 11) cm(exp -3). At a critical background plasma density of n(sub cr) approx. equals 8 x 10(exp 11) cm(exp -3), power enhancement appeared in both X-band and the Trivelpiece-Gould modes. When the background plasma density increased from 6 x 10(exp 11) cm(exp -3) to 8 x 10(exp 11) cm(exp -3), power enhancement of the S-band in this mode collaboration region reached up to 8 dB. Dissert. Abstr.

STUDY ON THE IMPROVED RELIABILITY AND SAFETY OF LITHIUM BATTERIES BY THE USE OF ELECTROCHEMICAL NOISE MEASUREMENT, VOLUME 1 Final Report
Wing S. Nip, Timothy J. Patraboy, James S. Anderson, Geoff Rodgers, and Michael D. Farrington 28 Feb. 1992 88 p
(Contract DSS-W2207-9-AF06/01-SV)
(FL-D-22-Vol-1; CTN-93-60677) Avail: CASI HC A05/MF A01

Investigations were conducted into the applicability of electrochemical noise measurement as a tool for diagnosing the state of health and state of charge in lithium batteries. Electrochemical noise is understood to mean the alternating current component of an otherwise direct current measured at the external terminals of the battery, especially random or periodic fluctuations at a microscopic level. A survey of ten commercial primary lithium cell products included three chemical systems (SO2, SOCl2, and MnO2) in a variety of sizes from coin cells to D size from several manufacturers. The cells were subjected to a systematic study of the relationship between noise and rate of discharge, temperature of discharge, temperature cycling, high temperature storage, and vibration exposure. Noise measurements were paralleled with alternating current impedance measurements for comparison. It became clear during the investigations that when a noise measurement identified a cell that was significantly different from the norm, it was a bad cell that would fail to deliver its rated capacity or would present a safety hazard. Often changes in the noise from a given cell were accompanied by changes in some impedance parameters; these changes appeared to be related. Noise measurements were sensitive to many elements of the cell history. CISTI

A REVIEW OF OPTICALLY CONTROLLED MICROWAVE DEVICES AND CIRCUITS Technical Report, Jun. 1991 - Jun. 1992
Arthur Paolella Sep. 1992 31 p
(AD-A259647; SLCET-TR-92-11) Avail: CASI HC A03/MF A01

The combining of optical and microwave technology is imminent, especially the integration of optical and microwave circuit functions on the same circuit or chip. Since the MESFET is the main active component of the GaAs MMIC, it makes sense to explore its properties as an optical detector for the detection of microwave and control signals in fiber optic links. This report is a review of the state of the art in the control of microwave devices and circuits by optical means. First, the use of the MESFET as the optical detector for the control of microwave circuits will be reviewed. Then, investigation for the optical control of microwave devices such as the Gunn device, impact ionization avalanche transit time device (IMPATT), high electron mobility transistor (HEMT), and bipolar transistor will be presented. Finally, different types of photodetectors are discussed and compared with the MESFET. GRA

APPLICABILITY OF SUPERCONDUCTING INTERCONNECTION TECHNOLOGY FOR HIGH SPEED IC'S AND SYSTEMS Final Quarterly Report
Oct. 1992 188 p
(Contract N00014-90-C-0217)
(AD-A259706) Avail: CASI HC A09/MF A02

The extremely low-loss characteristics of HTSC interconnect renders it an attractive candidate for high density-high performance digital circuitry. The purpose of this program was to investigate these properties in detail, and to determine the characteristics of systems that can best exploit these properties. To this end, a study was undertaken to more fully characterize the limitations of conventional interconnects, in particular, in the context of source-terminated CMOS devices, a technology well-adapted to cryogenic applications. Thermal and mechanical considerations of HTSC-MCM technology were explored as well as part of this effort. Applying Rent's Rule to system connection requirements, it was determined that HTSC interconnects can significantly reduce the required levels of wiring and/or increase the packing density of conventionally partitioned IC's on an MCM. This advantage is amplified if IC's are first optimized for MCM application (eg. using larger numbers of area-I/O pads at the chip levels). GRA

HIGH-VOLTAGE FAILURE MECHANISMS IN LIQUID-FILLED, FLUORINERT FC-40, CAPACITORS
J. D. McBrayer, C. B. Richardson, A. A. Jojola, and L. J. Pitre 1992 7 p Presented at the 13th Capacitor and Resistor Technology Symposium, Costa Mesa, CA, 8-11 Mar. 1993
(Contract DE-AC04-76DP-00789)
(DE93-006286; SAND-92-1981C; CONF-930394-1) Avail: CASI HC A02/MF A01

The high-voltage electrical failure of a liquid-filled, FC-40 Fluorinert, capacitor occurred during a system random vibration test. This failure occurred between 1 and 5 hours of random vibration of the system in the longitudinal axis of the capacitor. The previous five hours of random vibration in the transverse direction left the capacitor functioning as designed. Similar failures were observed during component random vibration testing under high-voltage. This paper will describe the investigation of the above mentioned failures. The design and processing of this type of capacitor technology will also be reviewed. Both electrical and mechanical data will be provided. The results of this investigation revealed the cause of the above failures and the procedures necessary for avoiding such failures in the future. The interaction of the mechanical system, piece-part designs and the bellows temperature compensation system will be explained in connection with the electrical failures. Suggestions for future improved designs will be included. DOE

STUDIES OF THE LONGITUDINAL INSTABILITY WITH AN ELECTRON BEAM
1993 15 p
(Contract DE-FG02-92ER-54178)
(DE93-006513; DOE/ER-54178/1) Avail: CASI HC A03/MF A01

Goals for our first-year period are as follows: To study the evolution of a small perturbation in the current pulse (introduced via the grid voltage on the electron gun) when the beam propagates through our 5-m long periodic solenoid channel. Specifically, to see if the perturbation is reflected from the rear end of the pulse. So far these objectives have been met without any delays. We were able to launch different perturbations on the beam resulting in either a slow space-charge wave or a fast wave or both waves. The relative strength of each wave was found to depend on the electron emission temperature of the cathode. The propagation of these waves on an initially rectangular longitudinal beam profile was measured with fast current monitors and the kinetic energy was measured with sensitive energy analyzers at various positions along the 5-m long solenoidal focusing channel. We have also begun to study the behavior of the waves when they reach the respective edge of the beam. But this work is still of a preliminary nature, and we need to refine the beam conditions and measurements in future studies to reach any firm conclusions. Preparations for the resistive-wall instability experiment are in progress. DOE

STUDY ON THE IMPROVED RELIABILITY AND SAFETY OF LITHIUM BATTERIES BY THE USE OF ELECTROCHEMICAL NOISE MEASUREMENT, VOLUME 2 Final Report
Wing S. Nip, Timothy J. Patraboy, James S. Anderson, Geoff Rodgers, and Michael D. Farrington 28 Feb. 1992 187 p
(Contract DSS-W2207-9-AF06/01-SV)
(FL-D-22-Vol-2; CTN-93-60693) Avail: CASI HC A09/MF A02

Electrochemical noise measurements were made and analyzed in order to study the reliability of various kinds of lithium primary cells. Sample tracking codes, figures relating to the main report showing performance results such as the cell voltage and noise voltage versus time, and a database on cell discharge behavior are provided. A literature review is also included on the categorization of noise, the interpretation and modelling of electrochemical noise, and examples of electrochemical noise studies. From the review, it is apparent that electrochemical noise measurements can provide very sensitive information, and are sometimes the only way to study certain electrochemical phenomena. Problems with such studies include the difficulty of quantitative interpretation of the data and the need to focus attention on the low-frequency component of the noise, which is the only portion of the noise that can be interpreted with any confidence. STUDY OF THE COMPATIBILITY OF PIN DETECTOR CIRCUITS AND FIELD EFFECT TRANSISTORS. EXTENSION TO HIGH MOBILITY AND ONE DIMENSIONAL ELECTRON GAS TRANSITORS Ph.D. Thesis - Toulouse Univ.
Michel DaSilva 1992 156 p In FRENCH; ENGLISH summary
(LAAS-92242; ETN-93-93686) Avail: CASI HC A08/MF A02

The results of a study of the compatibility between PIN circuits and heterojunction field effect transitors are presented. This structure gives good performances and it allows monolithic integration on semi-insulating substrate. The analysis of the photodetector properties defines the conception rules and optimizes the electrical and technological parameters spectral response, sensitivity, and speed. These rules give the design of field effect transistors compatible for the photodetection. Such a transistor presents a high value of transconductance and a low ratio between the square of the capacity and the transconductance. The results of the structure designs based on the previous rules show compatibility between the preamplifier and the PIN or metal semiconductor metal photodetectors. The devices were fabricated from heterojunctions grown in a semi-insulating GaAs substrate. The work done is satisfactory for the layer growth, the region lithography, the contact metallization part, and the device electrical characteristic activities. To further increase the circuit performances, the photodetector will integrate resonant cavity detectors and one dimensional electron gas field effect transistor. ESA

EVALUATION OF A NICKEL/METAL HYDRIDE BATTERY FOR A LOAD CONDITIONER
K. Kumai, T. Ikeya, T. Iwahori, and S. Sakai (Furukawa Battery Co. Ltd., Japan.) Apr. 1992 52 p
(DE93-761824; CRIE-T-91033) Avail: CASI HC A04/MF A01

An evaluation was given on applicability of Ni/metal hydride battery (AA-size, 1 Wh) to a load conditioning application. Unit cells and multicell batteries (series and parallel connections) were tested of their basic characteristics under charge and discharge conditions. The volumetric energy density of the Ni/metal hydride battery is 175 Wh/l, 2.5 times that of lead-acid batteries. The battery has an energy efficiency of 88 to 90 percent and superior output characteristics satisfying the development targets. On the other hand, it was found that the battery has optimal conditions in specific charging methods (potential regulating method, time regulating method, and constant voltage and constant current method). To operate the battery at a high efficiency and for a long life, the constant current and constant voltage charge would be most advantageous, but the charge method requires further improvements and discussions. In five-cell series and parallel operation tests, difference in the capacity and the internal resistance was the factor to vary the charge/discharge characteristics, but the efficiency was about the same as that of unit cells. DOE

HIGH TEMPERATURE SUPERCONDUCTIVITY Quarterly Report, period ending 30 Sep. 1992
James N. Eckstein 11 Dec. 1992 4 p
(Contract N00014-88-C-0760)
(AD-A259692) Avail: CASI HC A01/MF A01

The overall goals of this program are to develop the technology of MBE (Molecular Beam Epitaxy), growth of HTSC (High Temperature Superconductors) material, to optimize the performance of HTSC films with high transition temperatures and critical current densities, and to explore the development of electronic devices based on such material. During this period work focussed on learning how to grow the 123-phase semiconductor by atomic layering. The atomic absorption system was used to measure Dy and Ba. fluxes. The absorbance of Dy is somewhat low, by utilizing careful measurement techniques sufficiently precise measurements were obtained. Growth of the 123-phase under conditions similar to those used for growth of the Bi-family superconductors gave smooth surfaces and sharp transitions with a zero resistance temperature of more than 89 K. VARIABLE PRESSURE INSULATING JACKETS FOR HIGH-TEMPERATURE BATTERIES
P. A. Nelson, A. A. Chilenskas, and R. F. Malecha 1992 7 p Presented at the 27th Intersociety Energy Conversion Engineering Conference, San Diego, CA, 3-7 Aug. 1992
(Contract W-31-109-eng-38)
(DE93-006404; ANL/CMT/CP-75182; CONF-920801-29) Avail: CASI HC A02/MF A01

A new method is proposed for controlling the temperature of high-temperature batteries namely, varying the hydrogen pressure inside of multifoil insulation by varying the temperature of a reversible hydrogen getter. Calculations showed that the rate of heat loss through 1.5 cm of multifoil insulation between a hot-side temperature of 425 C and a cold-side temperature of 25 C could be varied between 17.6 W/m(sup 2) and 7,000 W/m(sup 2). This change in heat transfer rate can be achieved by varying the hydrogen pressure between 1.0 Pa and 1,000 Pa, which can be done with an available hydrogen gettering alloy operating in the range of 50 C to 250 C. This approach to battery cooling requires cylindrical insulating jackets, which are best suited for bipolar batteries having round cells approximately 10 to 18 cm in diameter. DOE

JOINT SERVICES ELECTRONICS PROGRAM. BASIC RESEARCH IN ELECTRONICS (JSEP) Final Report, 1 Apr. 1989 - 30 Jun. 1992
Edward J. Powers 1 Aug. 1992 29 p
(Contract F49620-89-C-0044)
(AD-A259598; TR-46; AFOSR-92-1013TR) Avail: CASI HC A03/MF A01

This final report summarizes research carried out by nine faculty and approximately eighteen graduate students at The University of Texas at Austin under the auspices of the Joint Services Electronics Program. This research program consists of five research units in solid-state electronics, two in electromagnetics, and two in information electronics. Solid-state electronics includes work in growth of III-V compounds by MBE, epitaxial growth of III-V semiconductor surfaces, charge transport in novel device-structures and materials, femtosecond processes in III-V semiconductors, and heterostructure device development. Information electronics includes multisensor signal processing, and nonlinear estimation and stochastic adaptive control. Research in electromagnetics involves millimeter wave active guided wave structures, and nonlinear wave phenomena. GRA

DIELECTRIC FOR THE SUPERCAPACITORS Final Report, 1 Sep. 1989 - 31 Aug. 1992
S. Petrucci Dec. 1992 8 p
(Contract DAAL03-89-K-0148)
(AD-A260124; ARO-26636.4-CH) Avail: CASI HC A02/MF A01

The main purpose of the research program (Sep. 1989 - Sep. 1992) has been to offer chemists or engineers (interested in building a high density capacitor, capable of storing electrical energy, to be delivered continuously or by short pulses) the knowledge of the dielectric spectrum of relevant polar-apolar liquid mixtures, in a frequency range as broad as possible. This would enable the construction of capacitors using liquids of

known dielectric properties at frequencies as high as feasible. To this end we have extended the microwave frequency range to 130 GHz (1 GHz = 10(exp 9) Hz). The dielectric far-infrared to infrared range from 0.9 to 150 THz (1 THz = 10(exp 12)Hz) or 30/cm to 5000/cm in wave numbers is explored. This has required the procurement (through another grant of the school) of a FTIR spectrometer covering the above range, which was adapted to our purpose. Extension of the determination of the real part of the permittivity of the solution e1 = n2 to visible frequencies, namely to the doublet emission line of Na at lambda = 589.3 nm, by conventional high precision visible refractometry, was also accomplished with the purchase and setting up of a Bellingham and Stanley high precision refractometer capable of determining n(sub D) to within + or - 1 x 10(exp -5). At about the end of the grant tenure, the imaginary part of the complex permittivity e vs frequency was interpreted in the far infrared range (for organic carbonate solutions in apolar solvents) by the Powles-Rocard resonant-relaxation function 2, which modifies the Debye relaxation function by retention of inertial effects. Four systems of liquid mixtures were explored. GRA

HIGH TEMPERATURE SUPERCONDUCTING COMPOUNDS Final Report, 1 Sep. 1987 - 30 Sep. 1992
Allen M. Goldman 30 Nov. 1992 19 p
(Grant AF-AFOSR-0372-87)
(AD-A259926; AFOSR-93-0003TR) Avail: CASI HC A03/MF A01

The major accomplishment of this grant has been to develop techniques for the in situ preparation of high-Tc superconducting films involving the use of ozone-assisted molecular beam epitaxy. The techniques are generalizable to the growth of trilayer and multilayer structures. Films of both the DyBa2Cu3O(7-x) and YBa2Cu3O(7-x) compounds as well as the La(2-x)Sr(x)CuO4 compound have been grown on the usual substrates, SrTiO3, YSZ, MgO, and LaAlO3, as well as on Si substrates without any buffer layer. A bolometer has been fabricated on a thermally isolated SiN substrate coated with YSZ, an effort carried out in collaboration with Honeywell Inc. The deposition process facilitates the fabrication of very thin and transparent films creating new opportunities for the study of superconductor-insulator transitions and the investigation of photo-doping with carriers of high temperature superconductors. In addition to a thin film technology, a patterning technology has been developed. Trilayer structures have been developed for FET devices and tunneling junctions. Other work includes the measurement of the magnetic properties of bulk single crystal high temperature superconductors, and in collaboration with Argonne National Laboratory, measurement of electric transport properties of T1-based high-Tc films. FORMATION OF DEFECT-FREE METAL/SEMICONDUCTOR CONTACTS Final Report, 10 Apr. 1986 - 31 Dec. 1991
John H. Weaver 15 Dec. 1992 14 p
(Contract N00014-86-K-0427)
(AD-A259604) Avail: CASI HC A03/MF A01

This program focused on the growth of metallic overlayers on semiconductor surfaces. Its goal was to investigate interface chemistry for a wide variety of metal-semiconductor systems and determine the growth structures produced by varying the metal and the processes of deposition. It was hoped that defect-free interfaces could be created by controlling the chemistry or the growth process itself. Indeed, a process involving cluster deposition was developed and shown to give interfaces that were free of conventional semiconductor defects. Throughout this program, modern surface science techniques were used to investigate the chemical and physical properties of metal-semiconductor interfaces. Over a six year period, a large amount of information regarding semiconductor surface disruption induced by the growing metal overlayers, interface intermixing, and overlayer structures was collected. ORGANIC ELECTROLYTES FOR SODIUM BATTERIES Final Report, 1 Apr. 1990 - 31 Mar. 1992
B. Vestergaard Sep. 1992 133 p
(AF Proj. 3145)
(AD-A260242; WL-TR-92-2114) Avail: CASI HC A07/MF A02

A summary of earlier given status reports in connection with the project on organic electrolytes for sodium batteries is presented. The aim of the investigations was to develop new room temperature molten salts electrolytes mainly with radical substituted heterocyclic organic chlorides mixed with aluminum chloride. The new electrolytes should have an ionic conductivity comparable with MEIC1:AlCl3 or better. A computer model program MOPAC (Molecular Orbital Package) was to be included to calculate theoretically reduction potentials for a variety of organic cations. Furthermore, MOPAC could be utilized to predict the electron densities, and then give a prediction of the stability of the organic cation. GRA

MONTE CARLO SIMULATION OF HIGH-FIELD ELECTRON TRANSPORT IN ALTERNATING-CURRENT THIN-FILM ELECTROLUMINESCENT DEVICES
K. Bhattacharyya, S. M. Goodnick, and J. F. Wager 1993 7 p
(Contract DAAL03-91-G-0242)
(AD-A260274; ARO-28852.3-PH) Avail: CASI HC A02/MF A01

An ensemble Monte Carlo simulation of electron transport in bulk ZnS at high electric fields is presented. Scattering mechanisms associated with polar optical phonons, acoustic phonons (through deformation potential coupling), intervalley scattering, and impurities (neutral and ionized) are included in a nonparabolic multi-valley model. The simulated results show that energetic electrons are available for impact excitation at fields exceeding 1 MV/cm, and that transient effects are negligible in explaining measured efficiencies in alternating-current thin-film electroluminescent (ACTFEL) devices. RADIO FREQUENCY CABLE TO OPTICAL FIBER CABLE Patent Application

Harold S. Rolls, inventor (to Navy) 29 Jun. 1992 11 p
(AD-D015620; US-Patent-Appl-SN-905703; Navy-Case-74457) Avail: CASI HC A03/MF A01

A bidirectional converter/interface for connecting several two-way broadband RF cables to a single pair of optical fibers is provided. In the reception mode, a broadband RF carrier of an optical conductor signal is directed to a plurality of bandpass filter/block converter combinations. These filter/converter combinations segment the broadband RF carrier into predetermined RF bands carrying the information. Each segmented band is then shifted (either up or down) to the receiving band frequency utilized by each of the RF systems. In the transmission mode, each transmitted signal from one of the RF systems is passed to a return path block converter/bandpass filter combination that shifts the entire transmitted band to a predetermined band. The predetermined bands are chosen such that each is a unique, non-overlapping band associated with a particular one of the RF systems. These unique bands are then combined into a single RF broadband signal that is converted to an optical signal and carried by a second optical conductor. GRA

REVERSIBLE POTASSIUM VANADIUM BRONZE CATHODES (K(x)V6O(13+y)) WITH VARIOUS POTASSIUM TO VANADIUM RATIOS
E. Andrukaitis 1992 14 p
(CTN-93-60709) Avail: CASI HC A03/MF A01

Electrodes composed of crystalline K(x)V6O(13+y), where x is from 0 to 3.6 and y from 0 to 3.8, were prepared by thermal decomposition at 300-350 C of electrochemically deposited (NH4)(x)K(4-x)V6O16 phases. The reversible lithium insertion into these materials was measured under cyclic voltammetry and constant current conditions. Phase changes during discharge resembled those of V2O5 or V6O13 for similar vanadium oxidation states and small K/V ratios. The reversible capacity decreased as the K/V ratios increased from 0.1 to 0.5 and was poor above 0.5 (Li/V less than 0.1). The reversible capacity of the bronzes improved for lower O/V ratios and the discharge voltage was similar to non stoichiometric V6O13. Best cycle life was obtained for non stoichiometric vanadium oxides with K/V ratios in the range of 0.05 to 0.3 for O/V ratios between 2.4 and 2.5. Over 50 cycles at the C-rate were obtained (only 5-10 percent of the capacity lost at 0.4 e(-)/V depth of discharge). Author (CISTI)

THE EVALUATION OF HOLLOW DIELECTRIC WAVEGUIDES FOR THERMOMETRY AND SPECTROSCOPY Ph.D. Thesis
Steven John Saggese 1992 248 p
Avail: Univ. Microfilms Order No. DA9238482

Hollow waveguides have been primarily used for the delivery of 10.6 micron CO2 laser power for medical and industrial applications. One class of hollow waveguides transmits energy by attenuated total internal reflection in regions of the infrared (IR) where the wall material exhibits an index of refraction, n(sub wall), below that of the air core (n(sub air) approximately equal to 1). For certain materials the transmission window of the hollow guides can be large (ie. sapphire where n is less than 1 from 9.7-17.0 microns), therefore, these waveguides are also candidates for non-power applications. This study investigates new hollow waveguide materials, characterizes the attenuation of hollow waveguides propagating incoherent radiation, and evaluates their use in sensor applications. Bulk materials were evaluated by determining the infrared reflectivity (R) with a Fourier transform infrared analyzer (FTIR). The complex refractive index, calculated from the R data using Kramers-Kronig analysis, was then evaluated with the Marcatili and Schmeltzer hollow waveguide attenuation equation. Glass and crystalline materials were studied, and it was found that low silica content calcium aluminate glasses exhibit an n less than 1 at 10.6 microns. The predicted attenuation was strongly dependent upon the silica content, and a minimum loss of 0.45 dB/m at 10.6 microns for the HE(sub 11) mode was calculated for a CaO-Al2O3-BaO glass 1 mm i.d. hollow waveguide. The attenuation characteristics of vitreous silica and single-crystal sapphire hollow guides, accomplished with the FTIR, revealed that the attenuation is typically 10x higher than theoretical predictions and is strongly dependent upon the launch conditions and fiber geometry. The bending losses for the n(sub wall) less than 1 spectral regions were significantly lower then when n(sub wall) greater than 1. The temperature of the waveguide was found to shift the transmission window of the hollow guides, and this effect can be modelled using reflectivity analysis of the bulk wall material. Radiometric temperature measurements were conducted effectively from room temperature to 2000 C with the sapphire hollow waveguides. The exceptional range is due to the infrared transmission and high temperature stability of the sapphire. Sensitive, extended pathlength gas spectroscopy was demonstrated by flowing CH4 and CO2 within the core of the waveguides, and their attenuations and usable temperature range were found to surpass spectroscopic lightpipes. Dissert. Abstr.

APPLICABILITY OF SUPERCONDUCTING INTERCONNECTION TECHNOLOGY FOR HIGH SPEED IC'S AND SYSTEMS Final Quarterly Report
Oct. 1992 210 p
(Contract N00014-90-C-0217)
(AD-A259520) Avail: CASI HC A10/MF A03

The extremely low-loss characteristics of HTSC interconnect renders it an attractive candidate for high density-high performance digital circuitry. The purpose of this program was to investigate these properties in detail, and to determine the characteristics of systems that can best exploit these properties. To this end a study was undertaken to more fully characterize the limitations of conventional interconnect, in particular in the context of source-terminated CMOS devices, a technology well-adapted to cryogenic applications. Thermal and mechanical considerations of HTSC-MCM technology were explored as well as part of this effort. Applying Rent's Rule to system connection requirements, it was determined that HTSC interconnects can significantly reduce the required levels of wiring and/or increase the packing density of conventionally partitioned IC's on an MCM. This advantage is amplified if IC's are first optimized for MCM application (eg. using larger numbers of area-I/O pads at the chip levels). Commercial applications of the technology were likewise explored, and it is believed that the development of conventional cryogenic-MCM optimization technology could prove to be a useful first step in the development of an appropriate HTSC-MCM infra-structure. An infrared vacuum soldering (IVS) process was developed for thick-film hybrid microcircuits (HMC's) being manufactured at Allied-Signal Inc., Kansas City Division (KCD). Sample HMC's were assembled and destructively tested to determine the intermetallic growth of the thick-film metallization when soldered to a mounting plate using 50-indium/50-lead solder and 63-tin/37-lead solder. The large voids in a solder joint reduce the area of solder contact to the metallization and contribute to nonuniform stress across the substrate. The indium-rich areas that feed the intermetallic growth in the solder joint can cause the electrical ground of the microcircuit to fail when enough of the remaining gold is consumed, affecting the ceramic-to-gold adhesion properties. Vacuum soldering has reduced the voids to between 1 to 5 percent, as compared to 50 percent using the belt soldering process. The development of IVS has provided a process that is more efficient, safer, easier to maintain, and more economical to operate than CVS but which still restricts the amount of intermetallic growth and reduces the voids in the solder joint. The IVS process was characterized and released for production in January 1991. DOE

(DE93-007785; ANL-92/38) Avail: CASI HC A03/MF A01

Development of useful high-critical-temperature (high-Tc) superconductors requires synthesis of superconducting compounds; fabrication of wires, tapes, and films from these compounds; production of composite structures that incorporate stabilizers or insulators; and design and testing of efficient components. This report describes the technical progress of research and development efforts aimed at producing superconducting components that are based on the Y-Ba-Cu, Bi-Sr-Ca-Cu, Bi-Pb-Sr-Ca-Cu, and (Tl,Pb)-(Ba,Sr)-Ca-Cu oxide systems. Topics discussed are synthesis and heat treatment of high-(Tc) superconductors, formation of monolithic and composite wires and tapes, superconductor/metal connectors, characterization of structures and superconducting and mechanical properties, fabrication and properties of thin films, and development of prototype components. Collaborations with industry and academia are documented. DOE

ADAPTIVE PREDISTORTION LINEARIZATION OF NONLINEAR POWER AMPLIFIERS M.S. Thesis
Bakri Aboukarr Ottawa, Ontario Carleton Univ. Sep. 1990 93 p
(ISBN-0-315-60483-2; CTN-93-60648) Copyright Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada, HC

To prevent significant interference by users of the radio spectrum, stringent restrictions on spectral emission are applied, motivating users to seek highly efficient transmission schemes. Such spectrally efficient modulation schemes as quadradture phase shift keying (QPSK) easily suffer the nonlinearities of high power amplifiers (HPA) and tend to spread the spectrum of the filtered signal. Linearization of HPA is a way to preserve high dc-to-radio frequency power conversion efficiency while achieving a high degree of spectrum efficiency of the modulated signal. In an adaptive linearization technique, the low pass equivalent envelope of the modulated signal is predistorted such that the amplified signal is a linear version of the modulated signal. The predistortion is achieved by mapping the modulated signal to a distorted signal using table lookup functions. The mapping is done using the polar representation of the low pass complex envelope of the modulated signal. The adaptation technique is analyzed and tested on a QPSK modulation system using computer simulation. Results indicate that the technique provides excellent performance, and in addition has the advantages of implementation simplicity, low memory and processing requirements, and fast convergence. The capabilities of a fine-line bipolar complementary metal oxide semiconductor (BiCMOS) process in the design of wideband transconductance integrators for precision monolithic continuous time filtering are explored. The design considerations of such an integrator are examined in detail, with an emphasis on tunability and phase compensation as a means for realizing a precision wideband design. The concept of open-loop transconductance filtering is described and possible circuit topologies are investigated. Detailed small-signal and large-signal analysis of one proposed circuit which has both tunable bandwidth and tunable phase compensation is presented. Application of such an integrator to open-loop transconductance filtering in the 10-50 MHz frequency range is studied. Simulation results show specific performance expectations of the proposed circuit. The tunable compensation circuit was seen to restrict the amplitude of signals which the integrator can pass without severe distortion or even instability occurring. A potential solution to this problem is deemed to be unsuitable for high frequency applications. The general design philosophy of applying low-frequency techniques to realize a high frequency circuit was seen to result in several fundamental problems. Author (CISTI)

The occurrence rates of pulse strings, or sequences of pulses with interarrival times less than the resolving time of the pulse-height analysis system used to acquire spectra, are derived from theoretical considerations. Logic circuits were devised to make experimental measurements of multiple pulse string occurrence rates in the output from a scintillation detector over a wide range of count rates. Markov process theory was used to predict state transition rates in the logic circuits, enabling the experimental data to be checked rigorously for conformity with those predicted for a Poisson distribution. No fundamental discrepancies were observed. Monte Carlo simulations, incorporating criteria for pulse pileup inherent in the operation of modern analog to digital converters, were used to generate pileup spectra due to coincidences between two pulses (first order pileup) and three pulses (second order pileup) for different semi-Gaussian pulse shapes. Coincidences between pulses in a single channel produced a basic probability density function spectrum. The use of a flat spectrum showed the first order pileup distorted the spectrum to a linear ramp with a pileup tail. A correction algorithm was successfully applied to correct entire spectra (simulated and real) for first and second order pileups. Author (CISTI)

FREQUENCY STABILITY CHARACTERIZATION OF HOPPING SOURCES AND MICROPROCESSOR-CONTROLLED FREQUENCY SYNTHESIS Ph.D. Thesis
Grigorius A. Kalivas Ottawa, Ontario Carleton Univ. May 1990 240 p
(ISBN-0-315-60447-6; CTN-93-60653) Copyright Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada, HC

A study is presented of the time domain stability of frequency agile sources such as voltage controlled oscillators under frequency hopping conditions. A procedure leading to short term noise characterization is presented, followed by a novel approach for obtaining expresssions for stability measures. This general approach can treat all types of noise in the same way, without requiring any knowledge of the autocorrelation function of the phase noise. As an application of the stability measurement procedure, a frequency synthesis method incorporating these ideas is included. The corresponding test system embodies recent trends toward computer control and digital processing in frequency synthesis. The synthesizer is operated in a closed-loop mode in which a frequency counter detects departures of the frequency from the desired value and correction is computer controlled using time domain adaptive algorithms including a novel modified least mean square algorithm exhibiting fast convergence. Experiment shows that regardless of the number of frequencies or the frequency hopping pattern, there always exists a flat horizontal portion on the Barnes-Allan variance estimator curves for values of averaging intervals in the 100 microsecond region. The implemented algorithm was shown to work as theoretically expected. Author (CISTI)

A WIDEBAND PARALLEL SAMPLING SYSTEM M.S. Thesis
Paul Langner Ottawa, Ontario Carleton Univ. Mar. 1990 237 p
(ISBN-0-315-60463-8; CTN-93-60654) Copyright Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada, HC

The operational bandwidth of contemporary flash analog to digital converters (ADC) is limited by the response time of the comparator. The difficulties in incorporating a fast track and hold amplifier into the front end of an ADC also limit performance. To overcome this limitation, it is possible to operate several ADC's in parallel. The theory and design of a parallel

sampled data system are presented, including the equivalence of single-point and parallel sampling systems. A prototype system is constructed for use with 100 MHz, 4-bit ADC's. A 1.2 Giga-sample/second system was made so that the input could be equipped with a realizable anti-aliasing filter. A numerical analysis of the overall system is developed and a program is presented which incorporates this analysis. This program is also used to demonstrate the spectral degradation that arises from errors in the parallel sampling system. In addition, a bipolar impulse generator used in the system is described. The practical results obtained from the prototype are compared with theory, showing good agreement. Author (CISTI)

ANALYTICAL RESULTS FOR THE ELECTROMAGNETIC RESPONSE OF A COMPOSITE SUPERCONDUCTING WIRE IN PARALLEL FIELDS
E. M. J. Niessen and P. J. Zandbergen May 1992 42 p
(MEMO-1059; ETN-93-93196) Avail: CASI HC A03/MF A01

An analytical method for calculating the electromagnetic response of a composite superconducting wire in fields parallel to the wire axis is presented. In general, the basic elements of a description are the Maxwell equations supplemented with a set of constitutive equations relating the electric field vector E and the current density vector j in the composite. The problem is nonlinear due to the nonlinear (vector E) - (vector j) relation describing the supercomputing filaments. By analytical means, it is shown that the nonlinear behavior of this kind of supercomputers can be studied. The new analytical method completely takes these nonlinear effects into account, contrary to linear methods which remove the nonlinear effects by introducing a linear surface current. The method gives an exact description of the response of a wire with non-conducting matrix material surrounding the filaments in the limit for zero filament radius. For a composite wire it provides a very good approximation, neglecting transient effects and the normal currents compared to the supercomputing currents. Results obtained by the method and a linear method are compared with data from a numerical method taking all effects into account. The linear method fails to decribe typical nonlinear effects. The new method shows very good agreement with numerical results. It provides data even more accurate than numerical data in regimes which suffer from relative large discretization errors. ESA

Laboratory experiments and direct numerical simulations (DNS) of passive scalar contaminant dispersal in bounded shear flows have been carried out. Both mass and heat transport have been experimentally studied. Statistical results for the temperature plume which develops from a line heat source at the wall are compared to the DNS results. The DNS results for this case and for the case of a uniform source with constant temperature boundaries are also compared to various model predictions. DOE

Iron's frontal solution method is employed in a recursive fashion to support adaptive meshing for solids. Specifically, the frontal solution environment is encapsulated into a data structure enabling it to be conveniently exchanged at different levels of recursion. Additionally, the ability to handle Lagrange multipliers added to the solver. The resulting finite element technique, while being relatively easy to implement, addresses many issues of adaptive meshing which are peculiar to nonlinear solids. DOE

Submicron size monodisperse particles are of interest in many industrial and scientific applications. These include the manufacture of ceramic parts using fine ceramic particles, the production of thin films by deposition of ionized clusters, monodisperse seed particles for laser anemometry, and the study of size dependence of cluster chemical and physical properties. An inexpensive and relatively easy way to generate such particles is by utilizing the phenomenon of spontaneous condensation. The phenomenon occurs when the vapor or a mixture of a vapor and a noncondensing gas is expanded at a high expansion rate. The saturation line is crossed with the supercooled vapor behaving like a gas, until all of a sudden at the so called Wilson point, condensation occurs, resulting in a large number of relatively monodisperse droplets. The droplet size is a function of the expansion rate, inlet conditions, mass fraction of vapor, gas properties, etc. Spontaneous condensation of steam and water vapor and air mixture in a one dimensional nozzle was modeled and the resulting equations solved numerically. The droplet size distribution at the exit of various one dimensional nozzles and the flow characteristics such as pressure ratio, mean droplet radius, vapor and droplet temperatures, nucleation flux, supercooling, wetness, etc., along the axial distance were obtained. The numerical results compared very well with the available experimental data. The effect of inlet conditions, nozzle expansion rates, and vapor mass

fractions on droplet mean radius, droplet size distribution, and pressure ratio were examined. Author (revised)

Ultrasonic nondestructive inspection demands more precise knowledge of sound propagation in materials. An approximate Gauss-Hermite (GM) model was developed a few years ago for the ultrasonic fields radiated into isotropic and anisotropic materials. In this dissertation, the validity of the GM model in a multilayered medium is evaluated. First, a method of finding the elastic constants of anisotropics is given. Comparisons between GM predictions and finite element predictions show good agreement around the central ray direction, but due to Fresnel approximation, the accuracy of GM model degrades away from the forward propagation direction. The GM model was used for sizing delaminations in a multilayered composite structure. This method, utilizing the reflected signal from the delamination, showed considerable improvement over the traditional sizing method. The model, with local ray tracing, was also used to predict the ultrasonic field beyond an irregularly shaped interface (step discontinuity), with good agreement with experiment. DOE

(Contract DE-FG05-88ER-13838)

(DE93-004123; CONF-930155-1) Avail: CASI HC A01/MF A01

The dispersal of contaminants in turbulent shear flows is an important concern in environmental science, meteorology and industrial processes. A number of approaches have been pursued in developing accurate means of predicting these phenomena, including traditional closure models applied to the Reynolds averaged transport equations, random flight models and probability density Junction methods. The development of DNS techniques for simulating turbulent dispersion provides a controlled means for studying the relative merits of diffusion algorithms in settings where all of the necessary fluid mechanical properties needed to implement the diffusion-calculations are available. The objective of this work is to describe a number of such tests which have been performed for turbulent dispersion in channel flow due to uniform and line sources. DOE

STRUCTURE OF CONFINED LAMINAR SPRAY DIFFUSION FLAMES: NUMERICAL INVESTIGATION

M. A. Mawid, D. L. Bulzan, and S. K. Aggarwal (Illinois Univ., Chicago.) Feb. 1993 29 p

(RTOP 505-62-21)

(NASA-TM-106038; ICOMP-93-2; E-7193; NAS 1.15:106038) Avail: CASI HC A03/MF A01

The structure of confined laminar spray diffusion flames is investigated numerically by solving the gas-phase conservation equations for mass species, continuity, momentum, and energy and the liquid-phase equations for droplet position, velocity, size, and temperature. A one-step global reaction scheme along with six equilibrium reactions are employed to model the flame chemistry. Monodisperse as well as polydisperse sprays are considered. The numerical results demonstrate that liquid spray flames substantially differ from gaseous flames in their structure, i.e., temperature, concentration, and velocity fields, shape, and dimensions under the same conditions. Spray flames are predicted to be taller and narrower than their counterpart gaseous ones and their shapes are almost cylindrical. This is in agreement with experimental observations. The numerical computations also show that the use of the equilibrium reactions with the one-step reaction scheme decreases the flame temperature compared to the one-step reaction scheme without the equilibrium reactions and more importantly increases the surface area of the flame zone due to a phenomenon termed 'equilibrium broadening.' The spray flames also possess a finite thickness with minimal overlap of the fuel and oxygen species. A case for which a fuel-mixture consisting of 20 to 80 percent gas-liquid by mass is introduced into the combustor is also investigated and compared with predictions using only gaseous or liquid fuel. NAVIER-STOKES COMPUTATION OF COMPRESSIBLE TURBULENT FLOWS WITH A SECOND ORDER CLOSURE, PART 1 Final Report

Hieu Haminh (Centre National de la Recherche Scientifique, Toulouse, France.), Wolfgang Kollmann (Centre National de la Recherche Scientifique, Toulouse, France.), and Dany Vandromme (Centre National de la Recherche Scientifique, Mont-Saint-Aignan, France.) 1990 69 p

(Contract NCC2-186)

(NASA-CR-192287; NAS 1.26:192287) Avail: CASI HC A04/MF A01

A second order closure turbulence model for compressible flows is developed and implemented in a 2D Reynolds-averaged Navier-Stokes solver. From the beginning where a kappa-epsilon turbulence model was implemented in the bidiagonal implicit method of MACCORMACK (referred to as the MAC3 code) to the final stage of implementing a full second order closure in the efficient line Gauss-Seidel algorithm, numerous work was done, individually and collectively. Besides the collaboration itself, the final product of this work is a second order closure derived from the Launder, Reece, and Rodi model to account for near wall effects, which has been called FRAME model, which stands for FRench-AMerican-Effort. During the reporting period, two different problems were worked out. The first was to provide Ames researchers with a reliable compressible boundary layer code including a wide collection of turbulence models for quick testing of new terms, both in two equations and in second order closure (LRR and FRAME). The second topic was to complete the implementation of the FRAME model in the MAC5 code. The work related to these two different contributions is reported. dilatation in presence of stron shocks. This work, which has been conducted during a work at the Center for Turbulence Research with Zeman aimed also to cros-check earlier assumptions by Rubesin and Vandromme. Derived from text

RESPONSE OF A NON-VISCOUS LIQUID COLUMN WITH ANCHORED LIQUID SURFACE TO AXIAL EXCITATION

Helmut F. Bauer 1991 27 p

(LRT-WE-9-FB-4-1991; ETN-93-93400) Avail: CASI HC A03/MF A01

The response of an axially excited cylindrical liquid column consisting of frictionless and incompressible liquid was investigated for a harmonic excitation. The column is located between two discs such that the free liquid surface exhibits there a stuck edge boundary condition. Free surface displacement and velocity response were determined. In addition the transient behavior of the liquid by the change of the axial excitation from one excitation amplitude and forcing frequency to another one was studied. The results shall be used for the efficient planning of the 'LICORE' experiments in the second German Spacelab mission (D-2). ESA

NUMERICAL SIMULATIONS OF THE CONTROL OF WAVE PACKET DISTURBANCES IN THE BOUNDARY LAYER ON A FLAT PLATE Final Report

Peter A. Dittrich and Hermann F. Fasel 12 Nov. 1992 151 p

(Contract N00014-90-J-1274)

(AD-A259923) Avail: CASI HC A08/MF A02

The control of laminar turbulent transition in incompressible flat plate boundary layers is investigated using direct numerical simulations. The investigations focus in particular on the control of wave packet disturbances that are characteristic for natural transition. A fully implicit finite difference/spectral method was developed to solve the governing equations. Wave packet disturbances are created by simulating the effect of thermally activated heater elements on the plate surface. Through controlled spanwise variation of the temperature of the heater elements, both two- and three-dimensional wave packet disturbances could be investigated. A transfer function technique was developed for the control strategy, where the transfer function is obtained directly from the numerical simulations. With this technique low amplitude, two-dimensional wave packet disturbances could be almost completely cancelled. Using a modified transfer function technique the control of three-dimensional wave packets was also very successful. It was found that the attenuation of only the two-dimensional components of a three-dimensional wave packet considerably delays the onset of the nonlinear interactions of the oblique modes. GRA

THEORETICAL AND PRAGMATIC MODELLING OF GOVERNING EQUATIONS FOR A TWO-PHASE FLOW IN BUBBLY AND ANNULAR FLOW REGIMES

M. Bottoni and W. Sengpiel (Kernforschungszentrum G.m.b.H., Karlsruhe, Germany.) 1992 8 p Presented at the 4th Brazilian Thermal Science Meeting (ENCIT-92), Rio de Janeiro, Brazil, 1-4 Dec. 1992

(Contract W-31-109-eng-38)

(DE93-004200; ANL/MCT/CP-77705; CONF-921234-1) Avail: CASI HC A02/MF A01

Starting from the rigorous formulation of the conservation equations for mass, momentum, and enthalpy, derived for a two-phase flow by volume averaging microscopic balance equations over Eulerian control cells, the formulation of the terms describing exchanges between the phases are discussed. Two flow regimes are taken into consideration, bubbly flow, applicable for small or medium void fractions, and annular flow, for large void fractions. When lack of knowledge of volume-averaged physical quantities make the rigorously formulated terms useless for computational purposes, modeling of these terms is discussed. DOE

IMPROVED TWO-EQUATION K-OMEGA TURBULENCE MODELS FOR AERODYNAMIC FLOWS

Florian R. Menter Oct. 1992 34 p

(RTOP 505-59-40)

(NASA-TM-103975; A-92183; NAS 1.15:103975) Avail: CASI HC A03/MF A01

Two new versions of the k-omega two-equation turbulence model will be presented. The new Baseline (BSL) model is designed to give results similar to those of the original k-omega model of Wilcox, but without its strong dependency on arbitrary freestream values. The BSL model is identical to the Wilcox model in the inner 50 percent of the boundary-layer but changes gradually to the high Reynolds number Jones-Launder k-epsilon model (in a k-omega formulation) towards the boundary-layer edge. The new model is also virtually identical to the Jones-Lauder model for free shear layers. The second version of the model is called Shear-Stress Transport (SST) model. It is based on the BSL model, but has the additional ability to account for the transport of the principal shear stress in adverse pressure gradient boundary-layers. The model is based on Bradshaw's assumption that the principal shear stress is proportional to the turbulent kinetic energy, which is introduced into the definition of the eddy-viscosity. Both models are tested for a large number of different flowfields. The results of the BSL model are similar to those of the original k-omega model, but without the undesirable freestream dependency. The predictions of the SST model are also independent of the freestream values and show excellent agreement with experimental data for adverse pressure gradient boundary-layer flows. Author

ON THE NONLINEAR INTERFACIAL INSTABILITY OF ROTATING CORE-ANNULAR FLOW Final Report

Aidrian V. Coward (Manchester Univ., England.) and Philip Hall (Manchester Univ., England.) Washington Feb. 1993 40 p Submitted for publication

(Contracts NAS1-18605; NAS1-19480; RTOP 505-90-52-01)

(NASA-CR-191432; NAS 1.26:191432; ICASE-93-7) Avail: CASI HC A03/MF A01

The interfacial stability of rotating core-annular flows is investigated. The linear and nonlinear effects are considered for the case when the annular region is very thin. Both asymptotic and numerical methods are used to solve the flow in the core and film regions which are coupled by a difference in viscosity and density. The long-term behavior of the fluid-fluid interface is determined by deriving its nonlinear evolution in the form of a modified Kuramoto-Sivashinsky equation. We obtain a generaiization of this equation to three dimensions. The flows considered are applicable to a wide array of physical problems where liquid films are used to lubricate higher or lower viscosity core fluids, for which a concentric arrangement is desired. Linearized solutions show that the effects of density and viscosity stratification are crucial to the stability of the interface. Rotation generally destabilizes non-axisymmetric disturbances to the interface, whereas the centripetal forces tend to stabilize flows in which the film contains the heavier fluid. Nonlinear affects allow finite amplitude helically travelling waves to exist when the fluids have different viscosities. Author

Reports by the staff of the University of Queensland on various research studies related to the advancement of scramjet technology are presented. These reports document the tests conducted in the reflected shock tunnel T4 and supporting research facilities that have been used to study the injection, mixing, and combustion of hydrogen fuel in generic scramjets at flow conditions typical of hypersonic flight. In addition, topics include the development of instrumentation and measurement technology, such as combustor wall shear and stream composition in pulse facilities, and numerical studies and analyses of the scramjet combustor process and the test facility operation. AUTOMATIC DIFFERENTIATION OF ADVANCED CFD CODES FOR MULTIDISCIPLINARY DESIGN
C. Bischof, G. Corliss, A. Griewank, L. Green, K. Haigler, and P. Newman 1992 17 p Presented at the Symposium on High-performance Computing for Flight Vehicles, Arlington, VA, 7-9 Dec. 1992
(Contract W-31-109-eng-38)
(DE93-005685; ANL/MCS/CP-78197; CONF-921243-1) Avail: CASI HC A03/MF A01

Automated multidisciplinary design of aircraft and other flight vehicles requires the optimization of complex performance objectives with respect to a number of design parameters and constraints. The effect of these independent design variables on the system performance criteria can be quantified in terms of sensitivity derivatives which must be calculated and propagated by the individual discipline simulation codes. Typical advanced CFD analysis codes do not provide such derivatives as part of a flow solution; these derivatives are very expensive to obtain by divided (finite) differences from perturbed solutions. It is shown that sensitivity derivatives can be obtained accurately and efficiently using the ADIFOR source translator for automatic differentiation. In particular, it is demonstrated that the 3-D, thin-layer Navier-Stokes, multigrid flow solver called TLNS3D is amenable to automatic differentiation in the forward mode even with its implicit iterative solution algorithm and complex turbulence modeling. It is significant that by using computational differentiation, consistent discrete nongeometric sensitivity derivatives have been obtained from an aerodynamic 3-D CFD code in a relatively short time, e.g., O(man-week) not O(man-year). FINITE ELEMENT METHODS IN HEAT TRANSFER
D. K. Gartling Oct. 1992 172 p
(Contract DE-AC04-76DP-00789)
(DE93-006451; SAND-92-0885) Avail: CASI HC A08/MF A02

The application of the finite element method to problems in conduction and convection heat transfer is described. The formulation of the basic equations is presented for nonisothermal, incompressible, viscous flows and nonisothermal flows in porous media; typical solution algorithms for both transient and time-independent problems are described. Example analyses are included for problems in heat conduction, forced convection and free convection. DOE

ASYMPTOTIC BEHAVIOR OF MODULATED TAYLOR-COUETTE FLOWS WITH A CRYSTALLINE INNER CYLINDER
R. J. Braun, G. B. McFadden, B. T. Murray, S. R. Coriell, and M. E. Glicksman Nov. 1992 47 p Prepared in cooperation with Rensselaer Polytechnic Inst., Troy, NY
(PB93-139061; NISTIR-4971) Avail: CASI HC A03/MF A01

The authors consider the linear stability of a modulated Taylor-Couette system when the inner cylindrical boundary consists of a crystalline solid-liquid interface. Both experimentally and in numerical calculations it is found that the two-phase system is significantly less stable than the analogous rigid-walled system for materials with moderately large Prandtl numbers. A numerical treatment based on Floquet theory is described, which gives results that are in good agreement with preliminary experimental findings. In addition, the instability is further examined by carrying out a formal asymptotic expansion of the solution in the limit of large Pradtl number. In the limit the Floquet analysis is considerably simplified, and the linear stability of the modulated system can be determined to leading order through a conventional stability analysis, without recourse to Floquet theory. The resulting simplified problem is then studied for both the narrow gap geometry and for the case of a finite gap. It is surprising that the determination of the linear stability of a two-phase system is considerably simpler than that of the rigid walled system, despite the complications introduced by the presence of the crystal-melt interface. A dual SAW sensor attached in cantilever fashion to a free floating membrane flush mounted on a structure exposed to turbulent fluid flow are described. Shear stress on the membrane due to the flow conditions deforms and bends the cantilever beam. The SAW devices are mounted such that one device is in compression and the other in tension. The cantilever arrangement magnifies the deformation of the SAW sensors by many orders of magnitude relative to the membrane. The SAW devices are attached to oscillator circuits and the change in frequency of the SAW oscillators due to the deformation can be accurately measured. The dual arrangement compensates changes in temperatures, electrical and mechanical noise and other changes and the difference in frequency measured by a mixer is directly related to the shear stress on the structure. Experiments conducted in a wind tunnel are described. GRA

SUMMARY OF EXPERIMENTAL HEAT-TRANSFER RESULTS FROM THE TURBINE HOT SECTION FACILITY
Herbert J. Gladden and Fredrick C. Yeh Apr. 1993 216 p
(RTOP 505-62-52)
(NASA-TP-3250; E-6615; NAS 1.60:3250) Avail: CASI HC A10/MF A03

Experimental data from the turbine Hot Section Facility are presented and discussed. These data include full-coverage film-cooled airfoil results as well as special instrumentation results obtained at simulated real engine conditions. Local measurements of airfoil wall temperature, airfoil gas-path static-pressure distribution, and local heat-transfer coefficient distributions are presented and discussed. In addition, measured gas and coolant temperatures and pressures are presented. These data are also compared with analyses from Euler and boundary-layer codes. Author

INCOMPRESSIBLE NAVIER-STOKES ALGORITHM FOR FLOW AND HEAT TRANSFER OVER ROUGH SURFACES Ph.D. Thesis
Kenton Ridgeway Fleming 1992 110 p
Avail: Univ. Microfilms Order No. DA9237050

The development of a computer model for simulation of incompressible turbulent flow and heat transfer over rough surfaces using the discrete element method is presented. The discrete element roughness model is implemented into an existing incompressible Navier-Stokes algorithm. This algorithm is a finite volume, incompressible Navier-Stokes solver which uses artificial compressibility and the Roe approximate Riemann solver, also referred to as the flux difference split method. The equations solved in this code were modified to include surface roughness effects in the flow. Details of the roughness effects on the flow are modeled empirically instead of being resolved in the computational geometry. The roughness element from drag and heat transfer are treated as volumetric sink and source terms, respectively. Cases were treated for flow and convective heat transfer over smooth and rough flat plates with different free stream velocities and roughness distributions. Also, flow computations were performed for an axisymmetric body with an inflected curved stern and a NACA-0012 airfoil. The rough flow prediction model was observed to simulate the effects of surface roughness accurately; in one case flow separation was indicated. In all cases the computed effects of surface roughness were observed to yield higher skin friction than the equivalent flow over a smooth surface. For the case of computed heat transfer over the flat plate, roughness increased heat transfer. Dissert. Abstr.

EXPERIMENTAL INVESTIGATION OF DEVELOPING AND FULLY DEVELOPED FLOW IN A CURVED DUCT OF SQUARE CROSS SECTION Ph.D. Thesis
Barry M. Bara 1991 261 p
(ISBN-0-315-70029-7) Avail: Univ. Microfilms Order No. DANN70029

An experimental and numerical study investigating the flow development and fully developed flows of an incompressible Newtonian fluid in a curved duct of square cross section for a curvature ratio of 15.1 is presented. Numerical simulations of flow development were performed using a parabolized form of the steady three-dimensional Navier-Stokes equations without imposing numerical symmetry. In addition, the two-dimensional solution structure was calculated using a steady formulation of the governing equations with a symmetry condition applied at the horizontal duct centerline. Both the three-dimensional and two-dimensional computer codes used in this study had been developed by previous investigators. Laser doppler measurements of axial velocity and flow visualization at Dn = 125, 137 and 150, revealed a steady and symmetric two-vortex flow at Dn = 125, and a steady and symmetric four-vortex flow at both Dn = 137 and Dn = 150 (Dn = Re/(square root of R/a) where Re is the Reynolds number, R is the radius of curvature of the duct and a is the width of the duct). Axial velocity measurements showed that the four-vortex flow at Dn = 150 developed to the solution predicted by the two-dimensional numerical simulation. However, the four-vortex flow at Dn = 137 was still developing when the flow had reached the end of the 240 deg axial length of the duct. A numerical investigation for Dean numbers below Dn = 175 revealed that at the limit point of the two-cell to four-cell transition the development length appeared to be infinite and thereafter decreased for increasing Dean numbers. The behavior of decreasing development length of the four-vortex flow with increasing Dean number has not been reported previously. Using a symmetrically positioned pin at theta = 5 deg to induce the four-cell flows, the two-dimensional solution structure for Dn less than or equal to 150 was experimentally observed for the first time. Experiments confirmed the numerical prediction that four-vortex flows are stable to symmetric perturbations, but unstable to asymmetric perturbations. An experimental and numerical investigation suggested that the four-vortex flow might evolve to flows with sustained spatial oscillations farther downstream. However without sufficient axial length to experimentally verify this, the state of the four-vortex flow at large axial distances still remains an unknown. Dissert. Abstr.

ON THE SOLUTION OF FLUID FLOW AND SOLID DEFORMATION INTERACTION PROBLEMS Ph.D. Thesis
Narayana Behera 1992 140 p
Avail: Univ. Microfilms Order No. DA9238129

The objective of this research is to develop numerical methods to solve the coupled field equations of fluid and solid mechanics which arise due to the interaction of fluid flow and solid deformation. Computational methods have been developed for solving a general class of time-dependent incompressible flow problems with solid boundaries that deform under the transient pressure and viscous stresses from the fluid. Three example problems are considered in this work. The first one is a limiting case of fluid solid interaction where the solid is just an elastic membrane enclosing the fluid. A physical counterpart of this is flow involving surface tension. Oscillation of a liquid jet issuing out of an elliptical orifice is chosen as the example problem for this case. The results of solving the Navier-Stokes equations are used to verify the validity of a simplified theoretical model for this physical problem. Two distinct numerical methods are used to solve the N-S equations involving moving boundary conditions. Finite difference method and spectral element methods are used. Both spatial and temporal coordinate transformation is used for the FD formulation of the problem. A Poisson equation for pressure is solved, and hyperbolic-parabolic grid generation is done at each time step. A spectral element method solution to the oscillating jet problem has been obtained. FD solution shows more damping compared to the SEM solution and the solution from the theoretical model, but the period of oscillation of all the three methods agree very closely. The solutions have been numerically validated. The second example problem of fluid flow and solid deformation interaction is the Couette flow with an elastic slab as boundary. A solution method has been demonstrated in which the algebraic equations resulting from the discretization of the fluid and solid equations can be solved separately and still have the solution to the coupled problem. This finding makes the solution of the coupled field equations in higher dimensions more easily implementable on conventional as well as parallel computers. Flow around an elastic cylinder is computed with this methodology, and the results compared with the flow around rigid cylinders. Dissert. Abstr.

LAMINAR AND TURBULENT INCOMPRESSIBLE FLUID FLOW ANALYSIS WITH HEAT TRANSFER BY THE FINITE ELEMENT METHOD Ph.D. Thesis
Robert James Cochran 1992 315 p
Avail: Univ. Microfilms Order No. DA9239435

A study of the finite element method applied to two-dimensional incompressible fluid flow analysis with heat transfer is performed using a mixed Galerkin finite element method with the primitive variable form of the model equations. Four biquadratic, quadrilateral elements are compared in this study--the serendipity biquadratic element with bilinear continuous pressure interpolation (Q2(8)-Q1) and the Lagrangian biquadratic element with bilinear continuous pressure interpolation (Q2-Q1) of the Taylor-Hood form. A modified form of the Q-2Q1 element is also studied. The pressure interpolation is augmented by a discontinuous constant shape function for pressure (Q2-Q1+). The discontinuous pressure element formulation makes use of biquadratic shape functions and a discontinuous linear interpolation of the pressure (Q2-P1(3)). Laminar flow solutions, with heat transfer, are compared to analytical and computational benchmarks for flat channel, backward-facing step and buoyancy driven flow in a square cavity. It is shown that the discontinuous pressure elements provide superior solution characteristics over the continuous pressure elements. Highly accurate heat transfer solutions are obtained and the Q2-P1(3) element is chosen for extension to turbulent flow simulations. Turbulent flow solutions are presented for both low turbulence Reynolds number and high Reynolds number formulations of two equation turbulence models. The following three forms of the length scale transport equation are studied: the turbulence energy dissipation rate (epsilon), the turbulence frequency (omega) and the turbulence time scale (tau). It is shown that the low turbulence Reynolds number model consisting of the k-tau transport equations, coupled with the damping functions of Shih and Hsu, provides an optimal combination of numerical stability and solution accuracy for the flat channel flow. Attempts to extend the formulation beyond the flat channel were not successful due to oscillatory behavior of the solutions. It is shown that the Streamline-Upwind/Petrov-Galerkin (SUPG) formulation provides stable solutions for the advection diffusion equation with biquadratic elements. However, when coupled with the Newton-Raphson linearization method, convergence behavior is reduced to less than first order, leading to unattainable computer time requirements. The high Reynolds number form of the k-epsilon and k-omega turbulence models are applied to flat channel and backward-facing step flows using a wall function element. This biquadratic element has continuous law-of-the-wall shape functions normal to the wall. It is shown that the k-epsilon and k-omega models work well for the flat channel flow. The k-epsilon model gave acceptable results for the backward-facing step flow, while the k-omega model gave erroneous results. Qualitatively correct thermal solutions for turbulent flow can be achieved. Dissert. Abstr.

Energy and helicity conservation are taken into account for subgrid turbulence modeling, in order to improve the vortex conservation of grid point models applied in meteorology. The influence of Turbulent Kinetic Energy and Helicity (TKEH) is considered for the mean flow equations. The subgrid scale model keeps the prognostic equation of turbulent kinetic energy and, in addition, the equation of turbulent helicity: the TKEH model. Two examples of simulation using TKEH modeling show improved vortex conservation, in comparison with diffuse turbulent kinetic energy modeling.

The simulated decay of a barotropic tropical cyclone segment is slowed down. TKEH modeling stabilizes the rotation of simulated thermals. ESA

KINETICS OF DIFFUSIONAL DROPLET GROWTH IN A LIQUID/LIQUID TWO-PHASE SYSTEM Final Report
James K. Baird and Judith B. Cain 12 Mar. 1993 67 p
(Grant NAG8-816)
(NASA-CR-192624; NAS 1.26:192624) Avail: CASI HC A04/MF A01

This report contains experimental results for the interdiffusion coefficient of the system, succinonitrile plus water, at a number of compositions and temperatures in the single phase region of the phase diagram. The concentration and temperature dependence of the measured diffusion coefficient has been analyzed in terms of Landau - Ginzburg theory, which assumes that the Gibb free energy is an analytic function of its variables, and can be expanded in a Taylor series about any point in the phase diagram. At most points in the single phase region this is adequate. Near the consolute point (critical point of solution), however, the free energy is non-analytic, and the Landau - Ginzburg theory fails. The solution to this problem dictates that the Landau - Ginzburg form of the free energy be replaced by Widom scaling functions with irrational values for the scaling exponents. As our measurements of the diffusion coefficient near the critical point reflect this non-analytic character, we are preparing for publication in a refereed journal a separate analysis of some of the data contained herein as well as some additional measurements we have just completed. When published, reprints of this article will be furnished to NASA.

OPERATOR SPLITTING METHODS FOR THE NAVIER-STOKES EQUATIONS Ph.D. Thesis
Bart David Semeraro 1992 139 p
Avail: CASI HC A07/MF A02

The properties of two algorithms for the solution of the incompressible Navier-Stokes equations are examined. These algorithms are representative of the two prevalent splitting philosophies used to split the Navier-Stokes equations. The properties of the algorithms are determined by Fourier analysis of a model problem. It is shown that splittings resulting in Stokes subproblems have desirable dissipative properties which are lacking in the velocity-pressure splittings. Algorithms for solving subproblems resulting from the splitting of the Navier-Stokes equations are introduced and compared to existing methods. The new methods are based on splitting of the Stokes matrix and subsequent orthogonal projection of the intermediate velocity onto a divergence free subspace. Algorithms based on several splittings are examined and compared to the conjugate gradient Uzawa algorithm. The split matrix scheme is accelerated by application of a Krylov subspace outer iteration. The accelerated scheme uses the conjugate gradient method if the iteration matrix is symmetric and positive definite and the Gmres algorithm if not. The accelerated scheme performed as well as or better than the Uzawa scheme. The nonlinear subproblem is preconditioned via an approximate Jacobian secant method. In this technique the secant method is accelerated by the application of a nonlinear Krylov method to the nonlinear system of equations which result in the application of Newtons method. The number of function evaluations required to solve the nonlinear system was greatly reduced by the application of the preconditioner.

In the last two decades, there have been extensive developments in computational aerodynamics, which constitutes a major part of the general area of computational fluid dynamics. Such developments are essential to advance the understanding of the physics of complex flows, to complement expensive wind-tunnel tests, and to reduce the overall design cost of an aircraft, particularly in the area of aeroelasticity. Aeroelasticity plays an important role in the design and development of aircraft, particularly modern aircraft, which tend to be more flexible. Several phenomena that can be dangerous and limit the performance of an aircraft occur because of the interaction of the flow with flexible components. For example, an aircraft with highly swept wings may experience vortex-induced aeroelastic oscillations. Also, undesirable aeroelastic phenomena due to the presence and movement of shock waves occur in the transonic range. Aeroelastically critical phenomena, such as a low transonic flutter speed, have been known to occur through limited wind-tunnel tests and flight tests. Aeroelastic tests require extensive cost and risk. An aeroelastic wind-tunnel experiment is an order of magnitude more expensive than a parallel experiment involving only aerodynamics. By complementing the wind-tunnel experiments with numerical simulations the overall cost of the development of aircraft can be considerably reduced. In order to accurately compute aeroelastic phenomenon it is necessary to solve the unsteady Euler/Navier-Stokes equations simultaneously with the structural equations of motion. These equations accurately describe the flow phenomena for aeroelastic applications. At Ames a code, ENSAERO, is being developed for computing the unsteady aerodynamics and aeroelasticity of aircraft and it solves the Euler/Navier-Stokes equations. The purpose of this contract is to continue the algorithm enhancements of ENSAERO and to apply the code to complicated geometries. During the last year, the geometric capability of the code was extended to simulate transonic flows, a wing with oscillating control surface. Single-grid and zonal approaches were tested. For the zonal approach, a new interpolation technique was introduced. The key development of the algorithm was an interface treatment between moving zones for a control surface using the virtual-zone concept. The work performed during the period, 1 Apr. 1992 through 31 Mar. 1993 is summarized. Additional details on the various aspects of the study are given in the Appendices.

APPLICATION OF A SAW DEVICE FOR MEASURING RATE OF GAS FLOW Final Report, Apr. 1991 - Jul. 1992
Shrinivas G. Joshi Sep. 1992 45 p Sponsored by Gas Research Institute, Chicago, IL
(Contract GRI-5091-260-2116)
(PB93-124931; GRI-92/0431) Avail: CASI HC A03/MF A01

The objective of the program is the development of a compact, high performance flow meter that will meet the specifications developed by the Gas Research Institute for the next generation of residential gas meters. A solid-state flow meter based on the use of surface acoustic wave (SAW) devices is considered for the application. Attractive features of SAW sensors include high sensitivity, wide dynamic range, direct digital output, small size, and low cost. In the exploratory research phase, a theoretical analysis of the operation of the SAW flow sensor was performed. This was then used to design a SAW device for the proposed application. Experimental measurements confirm that a single device can measure flow rates over the entire operating range of 118 ml/min. to 95 l/min. The accuracy of the sensor is better than the requirements by at least a factor of 10. Further work that needs to be done in order to reduce power consumption, improve speed of response, and reduce sensitivity to ambient temperature changes is discussed. Work done to date indicates that the SAW technique has good promise for realizing the next generation of residential gas meters.

(PB93-124147; CREARE-TM-1475B; GRI-92/0060.3) Avail: CASI HC A03/MF A01

Numerical modeling is performed for turbulent flow in axisymmetric nozzles using Creare's computer program FLUENT/BFC. The primary objective of the project was to assist Spectron Development Laboratories in selecting an optimum nozzle shape for an optical flowmeter. The nozzle performance is evaluated for various length to diameter ratios, area contraction ratios, and Reynolds numbers. The computations have demonstrated that a cubic profile nozzle with length to diameter ratio of 1.6 and area contraction ratio of 6.2 can decrease the velocity profile

non-uniformity from 15 percent at the entrance to 1 percent at the exit. The configuration is recommended for further investigation. GRA

FULLY IMPLICIT SOLUTIONS OF THE BENCHMARK BACKWARD FACING STEP PROBLEM USING FINITE ELEMENT DISCRETIZATION AND INEXACT NEWTON'S METHOD
P. R. McHugh and D. A. Knoll 1992 12 p Presented at the Winter Annual Meeting of the American Society of Mechanical Engineers (ASME), Anaheim, CA, 8-13 Nov. 1992
(Contract DE-AC07-76ID-01570)
(DE93-005246; EGG-M-92411; CONF-921110-45) Avail: CASI HC A03/MF A01

A fully implicit solution algorithm based on Newton's method is used to solve the steady, incompressible Navier-Stokes and energy equations. An efficiently evaluated numerical Jacobian is used to simplify implementation, and mesh sequencing is used to increase the radius of convergence of the algorithm. Finite volume discretization using the power law scheme of Patankar to solve the benchmark backward facing step problem defined by the ASME K-12 Aerospace Heat Transfer Committee is employed. LINPACK banded Gaussian elimination and the preconditioned transpose-free quasi-minimal residual (TFQMR) algorithm of Freund are studied as possible linear equation solvers. Implementation of the preconditioned TFQMR algorithm requires use of the switched evolution relaxation algorithm of Mulder and Van Leer to ensure convergence. The preconditioned TFQMR algorithm is more memory efficient than the direct solver, but our implementation is not as CPU efficient. Results show that for the level of grid refinement used, power law differencing was not adequate to yield the desired accuracy for this problem. DOE

A COMBINED GALERKIN/COLLOCATION SPECTRAL METHOD FOR TRANSIENT SOLUTION OF FLOW PAST A SPHERICAL DROPLET
H. D. Nguyen, S. Paik, and J. N. Chung (Washington State Univ., Pullman.) 1992 7 p Presented at the Winter Annual Meeting of the American Society of Mechanical Engineers (ASME), Anaheim, CA, 8-13 Nov. 1992
(Contract DE-AC07-76ID-01570)
(DE93-005251; EGG-M-92220; CONF-921110-47) Avail: CASI HC A02/MF A01

A spectral model, based on the stream function and vorticity, is developed in order to calculate the time-dependent solution of flow past a spherical droplet. Both Chebyshev and Legendre polynomials are used to expand the stream function and vorticity in the radial and angular directions, respectively, along with the backward Euler approximation to advance in time. Consistent treatment of boundary conditions is made to resolve the lack of vorticity boundary conditions by means of the influence matrix technique. The computed flow field, the drag coefficient, and the interfacial velocity are presented for Reynolds numbers in the range from 0.5 to 50 for both continuous and dispersed phases with viscosity ratios of 1 and 3. Comparison of the present results to those found in the literature indicate that the model is capable of predicting the correct nature of the flow associated with a droplet. DOE

The FLUENT and FLUENT/BFC computer programs have been used to numerically model turbulent flow through orifice meters. These simulations were based on solution of the Navier-Stokes equations incorporating a k-epsilon turbulence model. For ideal installations, trends in the discharge coefficient with Reynolds number, beta ratio, and surface roughness have been reproduced, and the value of the discharge coefficient has been computed to within 2 percent. Nonideal installations have also been simulated, including the effects of expanders, reducers, valves, and bends. Detailed modeling of flow through a bend has yielded results in good agreement with experimental data. The trend in discharge coefficient shifts for orifice meters downstream of bends has been predicted reasonably well. Author

A review of work on improving the predictive capabilities of the Morison equation for wave force analysis in both the time and frequency domain using system identification is presented. System identification requires samples of time data for force and flow velocity; data from a U tube, the De Voorst wave flume, and the Cristchurch Bay tower, is considered. The results obtained in the time domain include an improved classification of wave forces and excellent predictions of measured forces although the model structures are case specific. A series expansion for the force spectrum is proposed via the Morison-Duffing equation which promises more accurate modeling of high frequency components in the force histories for general application. This has implications for fatigue analysis. The use of neural networks to model dynamical systems is discussed. ESA

OSCILLATING-BODY VISCOMETRY AND ITS APPLICATION TO PHASE-SEPARATING LIQUID MIXTURES Ph.D. Thesis
Alfred Henry Krall, Jr. 1992 357 p
Avail: Univ. Microfilms Order No. DA9234598

This work is concerned with the theory and applications of oscillating-body viscometers. A review is presented of the derivation of accurate equations linking the period and decay rate of the body's oscillatory motion with the surrounding fluid's viscosity and density. For the case of an oscillating-disk viscometer, the possibility of a simultaneous determination of both fluid properties is investigated by analytic and numerical methods. In particular, attention is called to the subtle effect of the fixed plates often located above and below the disk. The practicality of the simultaneous determination of viscosity and density, which allows one to measure the viscosity without prior knowledge of the density, is demonstrated experimentally in measurements performed on liquid toluene. The apparatus used for this purpose is described in detail. New, precise data of the viscosity of toluene over a wide range of temperatures and pressures are presented. In the second half of this dissertation, the viscometer is applied to problems of current interest in critical phenomena and systems far from equilibrium. The exponent of the critical divergence of viscosity is measured for a binary liquid mixture near the consolute point. Measurements are made during quench-induced phase separation in order to study the rheological effects of concentration domains. Large enhancements of the viscosity are observed under these conditions, in agreement with the suggestion of Onuki. A main result is the discovery of shear elasticity, even at very low frequencies, in mixtures of simple liquids under these conditions. Mixtures of critical and off-critical compositions are found to exhibit qualitatively different behavior. These differences are interpreted as consequences of different domain morphologies and growth mechanisms. Dissert. Abstr.

DEVELOPMENT OF OPTICAL THREE-DIMENSIONAL MEASUREMENT TECHNIQUES FOR FLUID DYNAMICS Ph.D. Thesis
Yang Zhao 1992 250 p
Avail: Univ. Microfilms Order No. BRDX97959

This thesis presents two new optical methods which enable the simultaneous measurement of the three components of fluid velocity over an extended volume of a flow. The first, termed stereo particle image velocimetry, was an adaptation of the conventional particle image velocimetry (PIV) method. The second combined in-line holographic methods used with a stereo viewing technique. This method, named stereo in-line holography, enabled the location of seed particle positions along the recording optical axis to be more accurately defined. The image processing algorithms used in this procedure were also found to be extremely efficient. Special emphasis is placed on stereo camera modeling and the recovery of 3-D information from 2-D perspective images. Stereo image processing techniques are discussed which enable the matching of the two stereo images to be made more precisely. The stereo measurement facility developed for PIV was also adapted to provide information about the surface profile of freely propagating gravity water waves. Results and conclusions are presented based on the application of each technique to a variety of flows (air and water). The stereo PIV method was suited for use in the measurement over a wide velocity range, whereas the holographic method as described could be used only to investigate low speed flows. Both methods require low seeding density. Dissert. Abstr.

RECEPTIVITY OF THE BOUNDARY LAYER OVER A FLAT PLATE WITH DIFFERENT LEADING-EDGE GEOMETRIES: NUMERICAL SIMULATIONS Ph.D. Thesis
Nay Lin 1992 183 p
Avail: Univ. Microfilms Order No. DA9237267

The receptivity to freestream oscillations of the laminar boundary layer over a semi-infinite flat plate of finite thickness is simulated numerically. The incompressible flow past the flat plate is computed by solving the full Navier-Stokes equations in general curvilinear coordinates. A finite-difference method which is second-order accurate in space and time is used. Spatial and temporal developments of the Tollmien-Schlichting wave in the boundary layer, due to small-amplitude time-harmonic oscillations of the freestream velocity that closely simulate a sound wave traveling parallel to the plate for incompressible flow, are observed. The effect of leading-edge geometry is studied by using leading edges with different aspect ratios. The boundary layer over the flat plate with a sharper elliptic leading edge is found to be less receptive. A new leading-edge geometry, a modified super-ellipse, which provides continuous curvature at the juncture with the flat plate, is used to study the effect of continuous curvature and inherent pressure gradient on receptivity. It is found that receptivity magnitude depends on how rapid the pressure gradient changes along the wall, and for a given aspect ratio, there is an optimum variation of the leading-edge curvature for minimum receptivity. Moreover, the phase of the instability wave is determined by the location of the maximum adverse-pressure gradient along the wall. The threshold of linearity of the instability-wave response with respect to the freestream amplitude is investigated. The applicability of the linearized form of disturbance equations for this receptivity problem is also demonstrated. Dissert. Abstr.

TRANSIENT LIQUID-CRYSTAL TECHNIQUE USED TO PRODUCE HIGH-RESOLUTION CONVECTIVE HEAT-TRANSFER-COEFFICIENT MAPS
Steven A. Hippensteele and Philip E. Poinsatte Aug. 1993 11 p
Proposed for presentation at the 1993 National Heat Transfer Conference, Atlanta, GA, 8-11 Aug. 1993; sponsored by ASME
(RTOP 505-62-52)
(NASA-TM-106083; E-7702; NAS 1.15:106083) Avail: CASI HC A03/MF A01

In this transient technique the preheated isothermal model wall simulates the classic one-dimensional, semi-infinite wall heat transfer conduction problem. By knowing the temperature of the air flowing through the model, the initial temperature of the model wall, and the surface cooling rate measured at any location with time (using the fast-response liquid-crystal patterns recorded on video tape), the heat transfer coefficient can be calculated for the color isothermal pattern produced. Although the test was run transiently, the heat transfer coefficients are for the steady-state case. The upstream thermal boundary condition was considered to be isothermal. This transient liquid-crystal heat-transfer technique was used in a transient air tunnel in which a square-inlet, 3-to-1 exit transition duct was placed. The duct was preheated prior to allowing room temperature air to be suddenly drawn through it. The resulting isothermal contours on the duct surfaces were revealed using a surface coating of thermochromic liquid crystals that display distinctive colors at particular temperatures. A video record was made of the temperature and time data for all points on the duct surfaces during each test. The duct surfaces were uniformly heated using two heating systems: the first was an automatic temperature-controlled heater blanket completely surrounding the test duct like an oven, and the second was an internal hot-air loop through the inside of the test duct. The hot-air loop path was confined inside the test duct by insulated heat dams located at the inlet and exit ends of the test duct. A recirculating fan moved hot air into the duct inlet, through the duct, out of the duct exit, through the oven, and back to the duct inlet. The temperature nonuniformity of the test duct model wall was held very small. Test results are reported for two inlet Reynolds numbers of 200,000 and 1,150,000 (based on the square-inlet hydraulic diameter) and two free-stream turbulence intensities of about 1 percent, which is typical of wind tunnels, and up to 20 percent (using a grid), which is typical of real engine conditions. The problem of determining the acoustic field in an inviscid, isentropic fluid generated by a solid body whose surface executes prescribed vibrations is formulated and solved as a multiple scales perturbation problem, using the Mach number M based on the maximum surface velocity as the perturbation parameter. Following the idea of multiple scales, new 'slow' spacial scales are introduced, which are defined as the usual physical spacial scale multiplied by powers of M. The governing nonlinear differential equations lead to a sequence of linear problems for the perturbation coefficient functions. However, it is shown that the higher order perturbation functions obtained in this manner will dominate the lower order solutions unless their dependence on the slow spacial scales is chosen in a certain manner. In particular, it is shown that the perturbation functions must satisfy an equation similar to Burgers' equation, with a slow spacial scale playing the role of the time-like variable. The method is illustrated by a simple one-dimenstional example, as well as by three different cases of a vibrating sphere. The results are compared with solutions obtained by purely numerical methods and some insights provided by the perturbation approach are discussed. Author (revised)

THE THREE-DIMENSIONAL EVOLUTION OF A PLANE MIXING LAYER. PART 2: PAIRING AND TRANSITION TO TURBULENCE
Robert D. Moser and Michael M. Rogers Dec. 1992 91 p
(RTOP 505-59-53)
(NASA-TM-103926; A-92068; NAS 1.15:103926) Avail: CASI HC A05/MF A01

The evolution of three-dimensional temporally evolving plane mixing layers through as many as three pairings was simulated numerically. Initial conditions for all simulations consisted of a few low-wavenumber disturbances, usually derived from linear stability theory, in addition to the mean velocity. Three-dimensional perturbations were used with amplitudes ranging from infinitesimal to large enough to trigger a rapid transition to turbulence. Pairing is found both to inhibit the growth of infinitesimal three-dimensional disturbances and to trigger the transition to turbulence in highly three dimensional flows. The mechanisms responsible for the growth

of three-dimensionality as well as the initial phases of the transition to turbulence are described. The transition to turbulence is accompanied by the formation of thin sheets of span wise vorticity, which undergo a secondary roll up. Transition also produces an increase in the degree of scalar mixing, in agreement with experimental observations of mixing transition. Simulations were also conducted to investigate changes in span wise length scale that may occur in response to the change in stream wise length scale during a pairing. The linear mechanism for this process was found to be very slow, requiring roughly three pairings to complete a doubling of the span wise scale. Stronger three-dimensionality can produce more rapid scale changes but is also likely to trigger transition to turbulence. No evidence was found for a change from an organized array of rib vortices at one span wise scale to a similar array at a larger span wise scale.

RENORMALIZATION GROUP ESTIMATES OF TRANSPORT COEFFICIENTS IN THE ADVECTION OF A PASSIVE SCALAR BY INCOMPRESSIBLE TURBULENCE Final Report
Ye Zhou and George Vahala Washington Feb. 1993 31 p Submitted for publication Sponsored by NASA. Langley Research Center
(Contract NAS1-19480; RTOP 505-90-52-01)
(NASA-CR-191421; NAS 1.26:191421; ICASE-93-1) Avail: CASI HC A03/MF A01

The advection of a passive scalar by incompressible turbulence is considered using recursive renormalization group procedures in the differential sub grid shell thickness limit. It is shown explicitly that the higher order nonlinearities induced by the recursive renormalization group procedure preserve Galilean invariance. Differential equations, valid for the entire resolvable wave number k range, are determined for the eddy viscosity and eddy diffusivity coefficients, and it is shown that higher order nonlinearities do not contribute as k goes to 0, but have an essential role as k goes to k(sub c) the cutoff wave number separating the resolvable scales from the sub grid scales. The recursive renormalization transport coefficients and the associated eddy Prandtl number are in good agreement with the k-dependent transport coefficients derived from closure theories and experiments. AN INVESTIGATION OF PARTICLE TURBULENCE QUANTITIES IN A DENSE TWO-PHASE PIPE FLOW, USING LASER DOPPLER VELOCIMETRY Ph.D. Thesis
Christopher Abbott Cline 1992 178 p
Avail: Univ. Microfilms Order No. DA9236801

The mean and turbulence statistics for the solid phase of a liquid-sold two-phase turbulent pipe flow were studied for particle concentrations up to 12.5 percent by volume. The Reynolds number based on the pipe diameter and the liquid kinematic viscosity was 14500, while the Reynolds number based on the mixture kinematic viscosity ranged from 9400 to 14500. The test section was 44 pipe diameters downstream of the pipe entrance. Measurements were made as close as one wall unit from the wall, using a two-component laser Doppler velocimeter. The calculated velocity statistics included the mean through fourth order central moments, cross correlation, and triple correlations. The working liquid was an aqueous sodium iodide solution which matched the index of refraction of the acrylic pipe and acrylic test at the wavelengths of the argon-ion laser. The particles had a mean diameter of 150 microns and a size dispersion of 50 to 180 microns. The particles were less dense than the liquid, with a particle-to-liquid density ratio of 0.66. the particle Reynolds number was less than 100. Measurements in an unladen pipe flow were in very good agreement with previous investigations, with the exception of elevated axial and radial turbulence intensities. The elevated values were attributed to the pipe wall or LDV measurement volume vibrating. The particle mean velocity in the particle-laden flow followed the same law of the wall relationship as for an unladen fluid when inner scaling was done based on the bulk mixture properties. All profiles of the particle turbulence quantities were similar in shape and behavior to the unladen liquid profiles, with most profiles being self-similar with particle concentration. This suggests that the particles behave more or less like fluid elements embedded in a continuous fluid. The results also indirectly suggest that the particles are affecting the coherent turbulence structures that are responsible for turbulence production in the wall region. Dissert. Abstr.

WAKE-INDUCED UNSTEADY STAGNATION REGION HEAT TRANSFER MEASUREMENTS Ph.D. Thesis
Patrick Joseph Magari 1992 247 p
Avail: Univ. Microfilms Order No. DA9229689

An experimental investigation of wake-induced unsteady heat transfer in the stagnation region of a cylinder is presented. The objective of the study was to create a quasi-steady representation of the stator/rotor interaction in a gas turbine using two stationary cylinders. In this simulation, a larger cylinder, representing the leading-edge region of a rotor blade was immersed in the wake of a smaller cylinder, representing the trailing-edge region of a stator vane. The experiment was conducted in a short-duration, compression-heated wind tunnel which allowed for independent control of Mach number, Reynolds number, and gas-to-wall temperature ratio. Measurements were performed at a gas-to-wall temperature ratio of 1.35 and Mach numbers of 0.1 and 0.5 with range of 67,500-112,000 and 112,000-383,000, respectively. The background freestream turbulence intensity was less than 0.5 percent, and turbulence grids were utilized to enhance these levels to 4.5 percent at M infinity = 0.08 and 1.75 percent at M infinity = 0.5. Low-speed, isolated-cylinder heat-transfer results compared well with the results of previous investigations, but at the transonic Mach number (M infinity = 0.5), the heat-transfer rate decreased faster with the circumferential distance from the stagnation point. The wake-interaction results were obtained with two wake-generating cylinder diameters of 0.25 and 0.125 times the instrumented cylinder diameter. The streamwise separations between the leading edge of the instrumented cylinder and the centerline of the wake-generating cylinder were 8 and 16 wake-generator diameters. The mean and rms variation of the heat-transfer signals, cross-correlations between various gauges, and spectral analyses of the unsteady heat-transfer signals are presented. The stagnation-point heat transfer was found to reach a maximum independent of the Reynolds number and wake-generator diameter when presented in terms of the Frossling number (NU/square root of Re) at high values of the turbulence parameter Tu/square root of Re. Freestream turbulence levels had no appreciable effect upon the results. The power spectra and wavelet transforms of the heat-transfer signals revealed the importance of large vortical structures in the wake to the unsteady component of the heat transfer in the stagnation region. Dissert. Abstr.

NUMERICAL STUDY OF AXIAL TURBULENT FLOW OVER LONG CYLINDERS Ph.D. Thesis
Joao Correia Neves 1992 170 p
Avail: Univ. Microfilms Order No. DA9234139

Convex transverse curvature effects in wall bounded turbulent flows are significant if the boundary layer thickness is large compared to the radius of curvature. The curvature affects the inner part of the flow if a(+), the cylinder radius in wall units, is small. This flow regime is common in sonar devices towed by long cables. Two direct numerical simulations of transversely curved flows were performed and statistical and structural data were extracted from the computed flow fields. The effects of the transverse curvature were identified by comparing the present results with those of the plane channel simulation, performed at a similar Reynolds number. As expected, the transversely curved turbulent flow exhibits many

features common to the planar flows: near-wall low speed streaks, near-wall inclined shear layers, near-wall streamwise vortices, Reynolds shear stress dominated by second and fourth quadrant events, etc. As the curvature increases, the skin friction increases, the slope of the logarithmic region decreases and turbulence intensities are reduced. Several turbulence statistics are found to scale with a curvature dependent velocity scale derived from the mean momentum equation. Near the wall, the flow is more anisotropic than in the plane channel with a larger percentage of the turbulent kinetic energy resulting from the streamwise velocity fluctuations. Near-wall streamwise vortices are the strongest sources of pressure fluctuations. As the curvature increases, regions of strong normal vorticity develop near the wall. As the curvature increases the wall pressure fluctuations are dominated by smaller spanwise length scales. Fractional contributions from various layers in the flow to the wall r.m.s. pressure are marginally affected by the curvature. The ratio of the axial to azimuthal length scales of the wall pressure fluctuations increase with increasing curvature. Curvature dependent time and length scales are identified that collapse the high frequency range of the wall pressure temporal spectra and the high wave number range of the wall pressure streamwise spectra of flows with different curvatures. Taylor's hypothesis holds for the wall pressure fluctuations with a lower convection velocity than in the planar case. Dissert. Abstr.

DETERMINING NODES AND LONG-TIME APPROXIMATIONS TO THE NAVIER-STOKES EQUATIONS Ph.D. Thesis
Donald Arthur Jones, Jr. 1992 100 p
Avail: Univ. Microfilms Order No. DA9233674

Our main interest in this work is the study of the asymptotic behavior of solutions of the Navier-Stokes equations in bounded domains. It is known that if the large time behavior of the solutions to the Navier-Stokes equations is known on an appropriate finite set (nodal values), then the large time behavior of the solution itself is totally determined. We rigorously establish an upper-bound for the number of nodes needed to determine the solutions in two dimensions with periodic boundary conditions. We introduce the notion of determining finite volume elements, and we provide an upper bound on the number needed to determine the solutions in terms of the physical parameters of the problem. We also consider the 2D Navier-Stokes equations with time dependent external body forces. Under appropriate assumptions on the temporal properties of the forcing term we are able to construct a time dependent approximate inertial manifold. The particular manifold we construct is known by meteorologists as a slow manifold. We are also able to estimate the error resulting in the associated nonlinear Galerkin method. If the forcing term is too oscillatory in time, we show by example that the techniques used in the construction of certain approximate inertial manifolds for the autonomous case, in general, do not extend to the time dependent case. On the other hand, if the forcing term is time independent but smooth (Gevrey class), then, in general, the approximate inertial manifolds constructed for this case lead to an algebraic improvement over an already exponentially close flat manifold (Galerkin scheme). Finally, we present a numerical scheme based on the methodology of approximate inertial manifolds to a finite difference scheme. We perform a parameter study in which we compare the accuracy of a standard scheme with our modified scheme. Dissert. Abstr.

DEVELOPMENT OF ITERATIVE TECHNIQUES FOR THE SOLUTION OF UNSTEADY COMPRESSIBLE VISCOUS FLOWS Final Technical Report, 14 Feb. 1991 - 13 Feb. 1993
Duane Hixon and L. N. Sankar Mar. 1993 162 p
(Grant NAG1-1217)
(NASA-CR-192636; NAS 1.26:192636) Avail: CASI HC A08/MF A02

During the past two decades, there has been significant progress in the field of numerical simulation of unsteady compressible viscous flows. At present, a variety of solution techniques exist such as the transonic small disturbance analyses (TSD), transonic full potential equation-based methods, unsteady Euler solvers, and unsteady Navier-Stokes solvers. These advances have been made possible by developments in three areas: (1) improved numerical algorithms; (2) automation of body-fitted grid generation schemes; and (3) advanced computer architectures with vector processing and massively parallel processing features. In this work, the GMRES scheme has been considered as a candidate for acceleration of a Newton iteration time marching scheme for unsteady 2-D and 3-D compressible viscous flow calculation; from preliminary calculations, this will provide up to a 65 percent reduction in the computer time requirements over the existing class of explicit and implicit time marching schemes. The proposed method has ben tested on structured grids, but is flexible enough for extension to unstructured grids. The described scheme has been tested only on the current generation of vector processor architecture of the Cray Y/MP class, but should be suitable for adaptation to massively parallel machines.

A MULTIPLE-SCALE MODEL FOR COMPRESSIBLE TURBULENT FLOWS
William W. Liou and Tsan-Hsing Shih Mar. 1993 23 p
(Contract NCC3-233; RTOP 505-90-5K)
(NASA-TM-106072; ICOMP-93-07; CMOTT-93-02; E-7679; NAS 1.15:106072) Avail: CASI HC A03/MF A01

A multiple-scale model for compressible turbulent flows is proposed. It is assumed that turbulent eddy shocklets are formed primarily by the 'collisions' of large energetic eddies. The extra straining of the large eddy, due to their interactions with shocklets, enhances the energy cascade to smaller eddies. Model transport equations are developed for the turbulent kinetic energies and the energy transfer rates of the different scale. The turbulent eddy viscosity is determined by the total turbulent kinetic energy and the rate of energy transfer from the large scale to the small scale, which is different from the energy dissipation rate. The model coefficients in the modeled turbulent transport equations depend on the ratio of the turbulent kinetic energy of the large scale to that of the small scale, which renders the model more adaptive to the characteristics of individual flow. The model is tested against compressible free shear layers. The results agree satisfactorily with measurements. Author (revised)

The next generation of commercial aircraft will include turbofan engines with performance significantly better than those in the current fleet. Control of particulate and gaseous emissions will also be an integral part of the engine design criteria. These performance and emission requirements present a technical challenge for the combustor: control of the fuel and air mixing and control of the local stoichiometry will have to be maintained much more rigorously than with combustors in current production. A better understanding of the flow physics of liquid fuel spray combustion is necessary. This paper describes recent experiments on spray combustion where detailed measurements of the spray characteristics were made,

including local drop-size distributions and velocities. Also, an advanced combustor CFD code has been under development and predictions from this code are compared with experimental results. Studies such as these will provide information to the advanced combustor designer on fuel spray quality and mixing effectiveness. Validation of new fast, robust, and efficient CFD codes will also enable the combustor designer to use them as additional design tools for optimization of combustor concepts for the next generation of aircraft engines. BOTTOM GENERATED VELOCITY FLUCTUATIONS IN ONE-DIMENSIONAL OPEN CHANNEL FLOW

Bartele deJong Apr. 1992 21 p

(MEMO-1051; ETN-93-93191) Avail: CASI HC A03/MF A01

A method to calculate statistical characteristics of velocity fluctuations in a one dimensional open channel flow with a given vertical velocity profile and with irregular bottom waves, characterized by the spectral density function is proposed. The method is based on a calculation of the velocity fluctuations in the fluid generated by a harmonic corrugation of the bottom. Since linearized dynamical equations are used the velocity fluctuations due to random bottom disturbances may be obtained by superposition. The dynamics of the motion is assumed to be governed by the Orr-Sommerfeld equation representing the internal wave motion in the fluid. This equation is solved in an approximate manner by reducing it in the upper layer of the fluid to the inviscid Rayleigh equation. Close to the bottom it is simplified to a shape still containing the essentials of the viscous behavior of the flow. Numerical examples and a qualitative comparison to experimental data are given. STATIC AND AEROTHERMAL TESTS OF A SUPERALLOY HONEYCOMB PREPACKAGED THERMAL PROTECTION SYSTEM

Mark P. Gorton (Lockheed Engineering and Sciences Co., Hampton, VA.), John L. Shideler, and Granville L. Webb Washington Mar. 1993 51 p (RTOP 506-43-71-04)

(NASA-TP-3257; L-17084; NAS 1.60:3257) Avail: CASI HC A04/MF A01

A reusable metallic thermal protection system has been developed for vehicles with maximum surface temperatures of up to 2000 F. An array of two 12- by 12-in. panels was subjected to radiant heating tests that simulated Space Shuttle entry temperature and pressure histories. Results indicate that this thermal protection system, with a mass of 2.201 lbm/ft(exp 2), can successfully prevent typical aluminum primary structure of an entry vehicle like the Space Shuttle from exceeding temperatures greater than 350 F at a location on the vehicle where the maximum surface temperature is 1900 F. A flat array of 20 panels was exposed to aerothermal flow conditions, at a Mach number of 6.75. The panels were installed in a worst-case orientation with the gaps between panels parallel to the flow. Results from the aerothermal tests indicated that convective heating occurred from hot gas flow in the gaps between the panels. Proposed design changes to prevent gap heating occurred from hot gas flow in the gaps between the panels. Proposed design changes to prevent gap heating include orienting panels so that gaps are not parallel to the flow and using a packaged, compressible gap-filler material between panels to block hot gas flow in the gaps. Measurements of the one and two-point spectral statistics of the wall pressure field were conducted within a smooth-wall turbulent channel flow containing both Newtonian (water) and non-Newtonian liquids. The test section of the channel was located far enough downstream to insure fully developed turbulence and the high aspect ratio of the channel (18:1) provided homogeneity of the flow in the transverse direction. Single component laser Doppler velocimetry (LDV) measurements were conducted in both the Newtonian and non-Newtonian cases in order to validate the channel kinematics and aid in the interpretation of the pressure fluctuation statistics. Reynolds number effects were examined and compared to similar experimental results in the literature. Recently developed signal processing techniques were utilized to enhance the statistical quality of the wall pressure field at low frequencies and those results pertaining to the polymer flow regime are believed to be the first of such high quality. The most interesting feature indicated from the pressure statistics is the loss of information at high frequencies which contain eddies at the smallest scales. Furthermore, the pressure spectra scaled on outer variables suggest that the limits on this smallest scale can be related to the relaxation time of the polymer molecule. At the present time, it is believed that non-Newtonian fluids primarily affect the production of turbulence energy. However, results from the single point pressure statistics suggest that polymer flows enhance a fluid's ability to dampen out turbulence via dissipation. GRA

COMBINED CONVECTIVE RADIATIVE HEAT TRANSFER ENHANCEMENT IN AN ADVANCED GAS-FIRED SURFACE COMBUSTOR HEATER Annual Report, Mar. 1991-1992

Tian Yu Xiong and Boris Kramnik Dec. 1992 68 p Sponsored by Gas Research Inst., Chicago, IL

(Contract GRI-5090-260-1927)

(PB93-138915; GRI-92/0434) Avail: CASI HC A04/MF A01

A theoretical model development is being pursued at Purdue University. The purpose of this work is to support the ongoing experimental program at the Institute of Gas Technology (IGT) and to aid in scale-up of the small laboratory test stand to a commercial-size unit. The annual report reflects the work effort achieved for the reported period. During this period of time, the computational code has been developed step-by-step for each submodel. The computer code was developed to simultaneously solve the energy and momentum equation with variable properties. Experimental work on heat transfer to a single tube was completed, based on the need for validation of the mathematical model. A comparison of the major calculated parameters (pressure drop, gas temperature, heat transfer coefficients, thermal efficiency, and flame location) show very good agreement with IGT experimental data. MATHEMATICAL ANALYSIS OF GASDYNAMIC WAVE INITIATION Final Report, 8 Jul. 1991 - 7 Jul. 1992

D. R. Kassoy and J. Bebernes 15 Sep. 1992 11 p
(Contract DAAL03-91-G-0219)
(AD-A260382; ARO-28728.1-MA) Avail: CASI HC A03/MF A01

Mathematical modeling and analysis are described for studies of the dynamical response of inert or reactive systems to localized rapid power deposition. Theoretical, analytical, and numerical methods are developed to find general properties of nonlinear equation systems and explicit solutions for specific initial-boundary value problems. Emphasis is placed on physical interpretation of mathematical results for the transient evolution of spatially distributed thermal and gasdynamic responses. New results are given for thermal explosion processes, for transient development of shocks and detonations, for the role of nonlinear acoustics in gascompression, and for thermoacoustically induced mass transfer. SEPARATED FLOW PAST SMOOTH SLENDER BODIES Ph.D. Thesis
Ann Louise Williams 1991 349 p
Avail: Univ. Microfilms Order No. BRDX97391

This dissertation describes an investigation of the separated flow past slender bodies at high angles of attack. Flows of this type occur on aircraft and missile forebodies and can develop large forces which are important when considering stability and control of the vehicle. The objective of this work is to extend the vortex sheet model, which has previously been implemented for slender wings and circular and elliptic cones, to cones of more general cross-section and to non-conical bodies. The cross-sections of the bodies studied here are basically square or triangular, but with rounded corners. The model is inviscid, so the separation positions must be prescribed. Two distinct families of solutions have been identified. For laterally symmetric configurations with symmetric separation positions and no yaw, the first family solutions are symmetric, whereas the second family solutions are asymmetric. For elliptic cones, it is known that cross-section thickness affects the degree of asymmetry of the flow and this represents a mechanism for the control of side forces. Square or triangular cross-sections with rounded corners are of interest to aerodynamicists and have been investigated to assess the effect on asymmetry of making a circular cross-section 'square' or 'triangular'. For 'square' and 'triangular' cones placed either side, or corner on to the flow, results are obtained which enable the effect of cross-section shape on the degree of asymmetry to be assessed. A non-conical vortex sheet model has been developed for the first time for separation from a smooth body. Previously a non-conical line-vortex model was implemented, however lack of representation of vorticity near the separation line limits the applicability of the results. The solution procedure for the non-conical problem consists of a downstream-marching scheme starting from a known solution at the nose. Starting solutions are available if the flow at the nose is assumed conical. With symmetry enforced, solutions have been calculated far downstream, however progress for asymmetric solutions has been more limited. In the asymmetric case the vortex sheet develops inflexions which cause the solution procedure to fail. The non-conical formulation also permitted a stability analysis to be carried out for conical line-vortex solutions, which show that where asymmetric solutions exist they are stable and the corresponding symmetric solutions are unstable. HIGH RESOLUTION MEASUREMENTS OF MIXING AND REACTION PROCESSES IN TURBULENT FLOWS Annual Report, 1 Oct. 1991 - 31 Sep. 1992
Werner J. Dahm 10 Nov. 1992 34 p
(Grant AF-AFOSR-0541-89)
(AD-A259952; AFOSR-93-0029TR) Avail: CASI HC A03/MF A01

High resolution multi-dimensional imaging measurements were reported of the detailed structure of mixing and combustion processes in turbulent flows. These measurements are unique because they provide the first fully-resolved quantitative data on scalar dissipation rate field structure in turbulent reacting flows. These molecular mixing rate data were coupled with a two-parameter non-equilibrium reaction chemistry formulation to generate instantaneous maps of combustion species concentration and reaction rate fields in turbulent flames under varying degrees of chemical non-equilibrium. Results showed that the reaction zone structure transitioned smoothly from a thin layer-like structure to broad distributed reaction zones as the flame extinction limit was approached. Additionally, fully-resolved four-dimensional spatio-temporal imaging measurements were used to measure the larger scale topology of these scalar dissipation layers. Results showed that the distribution of layer separations is very nearly lognormal. This finding verified a recent analytical model of the multiplicative character of the repeated stretching and folding processes leading to this layer-like structure in the scalar dissipation fields in turbulent flows. This model, coupled with this two-parameter non-equilibrium reaction chemistry formulation, provides a simple approach for predicting the fine structure of molecular mixing and non-equilibrium reaction chemistry in turbulent combustion. COLLABORATIVE TESTING OF TURBULENCE MODELS Final Report, 23 Jan. 1990 - 31 Jul. 1992
P. Bradshaw 23 Dec. 1992 45 p
(Contract ARO-MIPR-124-90; AF-AFOSR-0154-90)
(AD-A260277; ARO-27625.2-EG) Avail: CASI HC A03/MF A01

This project, funded by AFOSR, ARO, NASA, and ONR, was run by the writer with Profs. Brian E. Launder, University of Manchester, England, and John L. Lumley, Cornell University. Statistical data on turbulent flows, from lab. experiments and simulations, were circulated to modelers throughout the world. This is the first large-scale project of its kirld to use simulation data. The modelers returned their predictions to Stanford, for distribution to all modelers and to additional participants ('experimenters')--over 100 in all. The object was to obtain a consensus on the capabilities of present-day turbulence models and identify which types most deserve future support. This was not completely achieved, mainly because not enough modelers could produce results for enough test cases within the duration of the project. However, a clear picture of the capabilities of various modeling groups has appeared, and the interaction has been helpful to the modelers. The results support the view that Reynolds-stress transport models are the most accurate. GRA

CONVECTIVE HEAT TRANSFER FROM DISCRETE HEAT SOURCES IN A LIQUID FILLED VERTICAL CHANNEL M.S. Thesis
Ronald G. Rahall Dec. 1992 71 p
(AD-A260556) Avail: CASI HC A04/MF A01

Natural, mixed and forced convection liquid cooling of discrete heat sources in a vertical channel were investigated experimentally. Ten heat sources were flush mounted to one side of a channel wall, while the opposite wall was unheated. Measurements of heater surface temperatures were made for a channel Reynolds number range of 0 - 1700 and heat flux range of 1050 - 4500 W/m(exp 2). In the mixed convection regime, both aiding and opposed flow were examined. Temperature patterns on the heated surface were visualized using liquid crystal. GRA

DETERMINATION AND CHARACTERISTICS OF THE TRANSITION TO TWO-PHASE SLUG FLOW IN SMALL CHANNELS

M. W. Wambsganss, J. A. Jendrzejczyk, and D. M. France (Illinois Univ., Chicago.) 1992 36 p Presented at the Winter Annual Meeting of the American Society of Mechanical Engineers (ASME), Anaheim, CA, 8-13 Nov. 1992

(Contract W-31-109-eng-38)

(DE93-004250; ANL/CP-76261; CONF-921110-36) Avail: CASI HC A03/MF A01

Two-phase pressure drop was measured in a small horizontal rectangular channel (hydraulic diameter = 5.44 mm). The two-phase fluid was an air/water mixture at atmospheric pressure tested over a mass flux range of 50 to 2000 kg/m(sup 2) s. Two-phase flow patterns were identified and an objective method was found for determining the flow pattern transition from bubble or plug flow to slug flow. The method is based on an RMS pressure measurement. In particular, it is shown that the transition is accompanied by a clear and abrupt increase in the RMS pressure when plotted as a function of mass quality. Use of the RMS pressure as a two-phase flow pattern transition indicator is shown to have advantages over pressure-versus-time trace evaluations reported in the literature. The transition is substantiated by a clear local change in slope in the curve of two-phase pressure drop plotted as a function of either Martinelli parameter or mass quality. For high mass fluxes, the change in slope is distinguished by a local peak. Some degree of substantiation was found in previous work for both of the results (the RMS pressure change and the local pressure drop change) at the transition to slug flow. DOE

A METHOD FOR THE ANALYSIS OF COMPLEX CONFIGURATION THREE DIMENSIONAL INTERNAL VORTICES BASED ON THE SOLUTION OF EULER EQUATIONS [UN METODO PER L'ANALISI DI CAMPI TRIDIMENSIONALI VORTICOSI INTORNO A CONFIGURAZIONE COMPLESSE BASATO SULLA RISOLUZIONE DELLE EQUAZIONI DU EULERO]

A. Amendola, R. Tognaccini, and P. L. Vitagliano 1989 11 p In ITALIAN Presented at Associazione Italiana di Aeronautica e Astronautica 10th Congresso Nazionale, Pisa, Italy, 16-20 Oct. 1989

(ETN-93-93701) Avail: CASI HC A03/MF A01

A computation program for subsonic and transonic analysis of complex aerodynamic configurations is presented. The flow model is based on Euler equations, and it is possible to introduce the propellor effect by means of boundary conditions (actuator disk model), so that the system is particularly suited to vortex fields. The software components are as follows: interactive graphics package for topological decomposition; computational grid generator; resolution of the equations of motion; and flow visualization. Application examples of industrially interesting configurations are presented, and future developments are outlined. ESA

ROLE OF ACOUSTICS IN FLAME/VORTEX INTERACTIONS Final Report

T. L. Jackson (Old Dominion Univ., Norfolk, VA.), Michele G. Macaraeg, and M. Y. Hussaini Washington Feb. 1993 37 p Submitted for publication Sponsored by NASA. Langley Research Center

(Contracts NAS1-18605; NAS1-19480; AF-AFOSR-0180-91; RTOP 505-90-52-01)

(NASA-CR-191429; NAS 1.26:191429; ICASE-93-4) Avail: CASI HC A03/MF A01

The role of acoustics in flame/vortex interactions is examined via asymptotic analysis and numerical simulation. The model consists of a one-step, irreversible Arrhenius reaction between initially unmixed species occupying adjacent half-planes which are allowed to mix and react by convection and diffusion in the presence of an acoustic field or a time-varying pressure field of small amplitude. The main emphasis is on the influence of the acoustics on the ignition time and flame structure as a function of vortex Reynolds number and initial temperature differences of the reactants. Author

EFFECTS OF CAPILLARITY ON MICROSCOPIC FLOW IN POROUS MEDIA

M. J. Miksis Jan. 1993 10 p

(Contract DE-FG02-88ER-13927)

(DE93-007626; DOE/ER-13927/5) Avail: CASI HC A02/MF A01

The objective of this proposal is to study the effects of capillarity on the motion of a fluid interface and to apply these results to flow in porous media. Here we report on several problems considered during this, the second year of the grant. In particular we have developed a numerical code to study the dynamics of a gas bubble in a pore in order to examine the fundamental mechanism for the generation of a foam in a porous material. Additionally, we have started an investigation of the stability of a foam lamella in order to understand the stability of foam flow in a porous material, and we have derived systematically a slip coefficient for flow over a rough surface, e.g., as in a pore. Finally, we report on work on several other problems. DOE

HYPERSONIC SHOCK/BOUNDARY-LAYER INTERACTION DATABASE (Diskette Supplement)

Gary S. Settles and Lori J. Dodson Apr. 1991 157 p Diskette supplement: IBM compatible 5.25-inch DSHD

(Grant NAG2-565; RTOP 505-59-40)

(NASA-CR-177577; NAS 1.26:177577; PSU-ME-90/91-003; NONP-Suppl-DK-93-159789) Avail: Issuing Activity (Center for AeroSpace Information) HC/DK A13

The present database collection and assessment effort, with respect to shock/boundary layer interactions, include both supersonic (M 3 and above) and hypersonic data, both two-dimensional (2-D) and three-dimensional (3-D) data, and both unseparated and separated turbulent boundary layer cases (though the emphasis is on the latter). Consideration not only includes perfect-gas behavior, but also real gases and (where appropriate) chemically-reacting flows. It is recognized, however, that very little data of the latter two types exist within the chosen subject area. A floppy disk containing data files of the hypersonic shock/boundary layer interaction database is included. Author

THREE-DIMENSIONAL TURBULENT BOUNDARY LAYER FLOW OVER A SPINNING CYLINDER (Diskette Supplement)

David M. Driver and Sheshagiri K. Hebbar (Naval Postgraduate School, Monterey, CA.) Dec. 1991 88 p Diskette supplement: IBM compatible 3.5-inch DSDD

(RTOP 505-60-11)

(NASA-TM-102240; A-89258; NAS 1.15:102240;

NONP-Suppl-DK-93-159800) Avail: Issuing Activity (Center for AeroSpace Information) HC/DK A09

Two sets of experiments are reported for a three-dimensional turbulent boundary-layer flow over a spinning cylinder, with and without a pressure gradient, which was produced by a forward-facing-step obstruction. Additional measurements are reported for two-dimensional flow over the same cylinder (nonspinning), with and without a pressure gradient. The data are presented in tables. The cylinder, which is axially aligned with the flow, contains three sections: an upstream stationary section, a central spinning section (where the flow develops a lateral component), and a downstream stationary section (where the flow's lateral component decays). Measurements were acquired primarily on the downstream stationary section and include all 3 components of mean velocity, all 6 Reynolds stresses, and 10 triple-velocity-product correlations. Surface pressure and skin friction were also measured. The data indicate that Reynolds shear stress is not simply proportional to mean-flow strain rate and that significant anisotropies develop in eddy viscosities. Also, the streamwise pressure gradient is seen to alter streamwise velocity and Reynolds stress without significantly affecting transverse velocity and Reynolds stress. Calculations using a Reynolds-stress equation model predict the mean flow reasonably well. Both corrected (for possible velocity biases) and uncorrected data are reported and stored on the floppy disk attached so that when future research on velocity bias is available an informed decision can be made as to which of the data sets to use. NONP-Suppl-DK-93-159801) Avail: Issuing Activity (Center for AeroSpace Information) HC/DK A09

Detailed experimental data were obtained on a supercritical airfoil and in the surrounding flowfield. Surface pressures were measured on both the model and wind-tunnel walls. The velocity field above the airfoil and the field in its wake was documented using a laser Doppler velocimeter. The data illustrate the effect of Mach number and angle of attack on the flow over the airfoil. Angles of attack ranged from 0.5 to 1.5 degrees and the Mach number was varied from 0.73 to 0.8. These variations were sufficient to provide separated and attached flows on the airfoil that were not time dependent. The profile drag was determined via non-intrusive measurements. The data are also on a 3.5-inch diskette included and are available though E-mail. Author (revised)

EXPERIMENTAL STUDY OF A THREE-DIMENSIONAL SHEAR-DRIVEN TURBULENT BOUNDARY LAYER WITH STREAMWISE ADVERSE PRESSURE GRADIENT (Diskette Supplement)

David M. Driver and James P. Johnston May 1990 263 p Diskette supplement: IBM compatible 5.25-inch diskette

(RTOP 505-60-11)

(NASA-TM-102211; A-89104; NAS 1.15:102211;

NONP-Suppl-DK-93-159790) Avail: Issuing Activity (Center for Aerospace Information) HC/DK A17

The effects of a strong adverse pressure gradient on a three-dimensional turbulent boundary layer are studied in an axisymmetric spinning cylinder geometry. Velocity measurements made with a three-component laser Doppler velocimeter include all three mean flow components, all six Reynolds stress components, and all ten triple-product correlations. Reynolds stress diminishes as the flow becomes three-dimensional. Lower levels of shear stress were seen to persist under adverse pressure gradient conditions. This low level of stress was seen to roughly correlate with the magnitude of cross-flow (relative to free stream flow) for this experiment as well as most of the other experiments in the literature. Variations in pressure gradient do not appear to alter this correlation. For this reason, it is hypothesized that a three-dimensional boundary layer is more prone to separate than a two-dimensional boundary layer, although it could not be directly shown here. None of the computations performed with either a Prandtl mixing length, k-epsilon, or a Launder-Reece-Rodi full Reynolds-stress model were able to predict the reduction in Reynolds stress. A 1.2 MB IBM-format floppy diskette is included. Author (revised)

NUMERICAL MODELING OF FLUIDIC FLOW METERS Final Report, Sep. 1987 - Feb. 1989
D. Choudhury and B. R. Patel May 1992 47 p Sponsored by Gas Research Inst., Chicago, IL
(Contract GRI-5086-271-1269)
(PB93-124139; CREARE-TM-1475-C; GRI-92/0060.2) Avail: CASI HC A03/MF A01

The transient fluid flow in fluidic flow meters has been modeled using Creare.x's flow modeling computer program FLUENT/BFC that solves the Navier-Stokes equations in general curvilinear coordinates. The numerical predictions of fluid flow in a fluidic flow meter have been compared with the available experimental results for a particular design, termed the PC-4 design. Overall flow structures such as main jet bending, and primary and secondary vortices predicted by FLUENT/BFC are in excellent agreement with flow visualization results. The oscillation frequencies of the PC-4 design have been predicted for a range of flow rates encompassing laminar and turbulent flow and the results are in good agreement with experiments. The details of the flow field predictions reveal that an important factor that determines the onset of oscillations in the fluidic flow meter is the feedback jet momentum relative to the main jet momentum. The insights provided by the analysis of the PC-4 fluidic flow meter design have led to an improved design. The improved design has sustained oscillations at lower flow rates compared with the PC-4 design and has a larger rangeability.

Tomographic x-ray holography may make possible the imaging of biological objects at high resolution in three dimensions. We performed a demonstration experiment with soft x-rays to explore the feasibility of this technique. Coherent 3.2-nm undulator radiation was used to record Fourier transform holograms of a microfabricated test object from various illumination angles. The holograms were numerically reconstructed according to the principles of diffraction tomography, yielding images of the object that are well resolved in three dimensions. DOE

(DE93-005478; LA-UR-92-4227; CONF-930249-1) Avail: CASI HC A03/MF A01

A nonintrusive, noncontacting method we developed for temperature measurements in hostile environments is well-suited for measurements on advanced turbine components. The method is not only superior to thermocouples in sufficiently difficult environments, but also is the only known method for making measurements in situations where no form of pyrometry works. We demonstrated the method, which uses laser-induced fluorescence of thermographic phosphors bonded to the component surfaces, on turbine blades and vanes in developmental turbine engines. The method is extendable to the much-higher temperatures expected inside advanced turbomachinery. Of particular note is the adaptability of the method to surface-temperature measurements on ceramics operating at high temperatures. In this temperature range, the ceramics become translucent, and surface emissivity becomes meaningless. We shall discuss the method, its advantages and limitations, recent test results on operating turbine engines, and the extension to ceramic components. DOE

COMPARISON OF ANEMOMETERS FOR TURBULENCE CHARACTERIZATION
V. R. Morris, J. C. Barnard, L. L. Wendell, and S. D. Tomich Oct. 1992 9 p Presented at the Windpower 1992, Seattle, WA, 19-23 Oct. 1992
(Contract DE-AC06-76RL-01830)
(DE93-004336; PNL-SA-21321; CONF-921049-6) Avail: CASI HC A02/MF A01

During the first phase of the US Department of Energy's turbulence characterization program, important discoveries were made about the field application of propeller-vane and cup anemometers under very turbulent conditions. First, averaged speeds measured by the propeller-vane anemometer were consistently lower than those from the cup anemometer, even though both registered virtually the same during wind-tunnel calibration testing. Second, the propeller-vane anemometers suffered from structural failures much more frequently than the cup anemometers. The difficulties associated with the use of the propeller-vane motivated us to consider the cup anemometer for turbulence measurements. At fast sample rates, the output of the cup anemometer is severely degraded by discretization error that stems from pulse counting demodulation. However, we found that a low-pass Gaussian filter could be applied to the time series of wind speed derived from the cup anemometer to yield time series and frequency spectra that compared very favorably with those obtained from the propeller-vane anemometer. This finding suggests that the cup anemometer may prove to be an inexpensive and rugged sensor appropriate for turbulence measurements for wind-energy applications. DOE

The Space Station Furnace Facility (SSFF) is an advanced facility for materials research in the microgravity environment of the Space Station Freedom and will consist of Core equipment and various sets of Furnace Module (FM) equipment in a three-rack configuration. This Project Implementation Plan (PIP) document was developed to satisfy the requirements of Data Requirement Number 4 for the SSFF study (Phase B). This PIP shall address the planning of the activities required to perform the detailed design and development of the SSFF for the Phase C/D portion of this contract. Author (revised)

The Space Station Furnace Facility (SSFF) is a modular facility for materials research in the microgravity environment of the Space Station Freedom (SSF). The SSFF is designed for crystal growth and solidification research in the fields of electronic and photonic materials, metals and alloys, and glasses and ceramics and will allow for experimental determination of the role of gravitational forces in the solidification process. The facility will provide a capability for basic scientific research and will evaluate the commercial viability of low-gravity processing of selected technologically important materials. The facility is designed to support a complement of furnace modules as outlined in the Science Capabilities Requirements Document (SCRD). The SSFF is a three rack facility that provides the functions, interfaces, and equipment necessary for the processing of the furnaces and consists of two main parts: the SSFF Core Rack and the two Experiment Racks. The facility is designed to accommodate two experimenter-provided furnace modules housed within the two experiment racks, and is designed to operate these two furnace modules simultaneously. The SCRD specifies a wide range of furnace requirements and serves as the basis for the SSFF conceptual design. SSFF will support automated processing during the man-tended operations and is also designed for crew interface during the permanently manned configuration. The facility is modular in design and facilitates changes as required, so the SSFF is adept to modifications, maintenance, reconfiguration, and technology evolution. Author (revised)

Society of America
(RTOP 593-21-00)
(NASA-TM-105996; E-7536; NAS 1.15:105996) Avail: CASI HC A03/MF A01

The performance of a sensor is often evaluated by determining to what degree of accuracy a measurement can be made using this sensor. The absolute accuracy of a sensor is an important parameter considered when choosing the type of sensor to use in research experiments. Tests were performed to improve the accuracy of cryogenic temperature measurements by calibration of the temperature sensors when installed in their experimental operating environment. The calibration information was then used to correct for temperature sensor measurement errors by adjusting the data acquisition system software. This paper describes a method to improve the accuracy of cryogenic temperature measurements using corrections in the data acquisition system software such that the uncertainty of an individual temperature sensor is improved from plus or minus 0.90 deg R to plus or minus 0.20 deg R over a specified range. A SPARSE ARCHITECTURE LOW POWER GATED INTEGRATOR FOR USE WITH GERMANIUM GAMMA RAY SPECTROMETERS IN REMOTE GEOCHEMISTRY MEASUREMENTS
N. Madden, D. Landis, R. Adachi, R. Pehl, R. Abott, and E. Stogsdill Oct. 1992 5 p Presented at the Nuclear Science Symposium, Orlando, FL, 26-31 Oct. 1992
(Contract DE-AC03-76SF-00098)
(DE93-004769; LBL-32273; CONF-921005-13) Avail: CASI HC A01/MF A01

Prototypical circuits of a low power gated integrator for use with germanium gamma-ray spectrometers in remote locations have been developed. The gated integrator is constructed from three very simple sub circuits. With a power consumption of less than 250mW the low count rate spectroscopy performance of this gated integrator is comparable to that of a conventional pulse shaping amplifier at energies of 1 MeV and greater. ICING RESEARCH TUNNEL ROTATING BAR CALIBRATION MEASUREMENT SYSTEM
Theresa L. Gibson and John M. DeArmon (Sverdrup Technology, Inc., Brook Park, OH.) Mar. 1993 16 p Prepared for presentation at the 39th Aerospace Industries/Test Measurement Symposium, Albuquerque, NM, 3-6 May 1993; sponsored by the Instrument Society of America
(RTOP 505-62-84)
(NASA-TM-106010; E-7539; NAS 1.15:106010) Avail: CASI HC A03/MF A01

In order to measure icing patterns across a test section of the Icing Research Tunnel, an automated rotating bar measurement system was developed at the NASA Lewis Research Center. In comparison with the previously used manual measurement system, this system provides a number of improvements: increased accuracy and repeatability, increased number of data points, reduced tunnel operating time, and improved documentation. The automated system uses a linear variable differential transformer (LVDT) to measure ice accretion. This instrument is driven along the bar by means of an intelligent stepper motor which also controls data recording. This paper describes the rotating bar calibration measurement system. Author

A BOLOMETRIC RADIOMETER FOR INVESTIGATIONS IN COSMOLOGY Ph.D. Thesis
Gregory A. Wright 1992 144 p
Avail: Univ. Microfilms Order No. DA9235270

This thesis describes the design and construction of a bolometric radiometer operating at a wavelength of 1.2 millimeters. The goal of this experiment is to search for the millimeter wave radiation from primeval galaxies. The instrument's sensitivity, based upon laboratory measurements, is adequate to test models of galaxy formation that have an infrared bright period at high redshift. The bolometer is cooled by an adiabatic demagnetization refrigerator. The construction of the refrigerator, capable of cooling the detector to 50 mK and keeping it cold for over eight hours is detailed. The experiment is installed on the 7 meter radio telescope on Crawford Hill in Holmdel, New Jersey. The design of a feed mirror system compatible with the telescope is described. Particular attention was devoted to minimizing scattering of the beam; all mirrors are offset conics. Operation of the instrument should begin in the fall of 1992. Dissert. Abstr.

OTV BEARING DEFLECTION INVESTIGATION
B. L. Reimer (Aerojet-General Corp., Sacramento, CA.), R. T. Diepenbrock (Aerojet-General Corp., Sacramento, CA.), and M. G. Millis Apr. 1993 18 p Sponsored by NASA. Lewis Research Center
(Contract F04611-86-C-0010; RTOP 593-12-11)
(NASA-TM-106085; E-7714; NAS 1.15:106085) Avail: CASI HC A03/MF A01

The primary goal of the Bearing Deflectometer Investigation was to gain experience in the use of fiber optic displacement probe technology for bearing health monitoring in a liquid hydrogen turbo pump. The work specified in this Task Order was conducted in conjunction with Air Force Rocket Propulsion Laboratory Contract F04611-86-C-0010. APD conducted the analysis and design coordination to provide a displacement probe design compatible with the XLR-134 liquid hydrogen turbo pump assembly (TPA). Specifications and requirements of the bearing deflectometer were established working with Mechanical Technology Instruments, Inc. (MTI). The TPA design accommodated positioning of the probe to measure outer race cyclic deflections of the pump inlet bearing. The fiber optic sensor was installed as required in the TPA and sensor output was recorded during the TPA testing. Data review indicated that no bearing deflection signature could be differentiated from the inherent system noise. Alternate sensor installations were not investigated, but might yield different results. Author

PYROELECTRIC ANEMOMETERS AND KINETIC CALORIMETERS Annual Report, 1 Apr. 1990 - 30 Mar. 1991
Steven H. Y. Hsieh, Anita Spetz, and Jay N. Zemel Nov. 1991 42 p Sponsored by Gas Research Inst., Chicago, IL
(Contract GRI-5089-260-1882)
(PB93-141919; GRI-91/0322) Avail: CASI HC A03/MF A01

The pyroelectric anemometer (PA) is a thermal detector developed at the University of Pennsylvania for monitoring gas flows. The range of the PA has been demonstrated to be quite extraordinary, covering a minimum of five orders of magnitude. The heat requirements for the device are quite minimal (maximum of 20 mW) which insures that the maximum

temperature reached by the 6 mm x 6 mm PA is less than 3 C. As a thermally based flow sensor, the PA is a flexible sensor that can be used in a variety of geometric configurations and placed in various positions in a pipe because of its small physical volume. The goal of this program is to conduct a fundamental investigation on the characteristics and properties of the PA that would establish it as a suitable device for directly monitoring large volume flows in natural gas transmission lines or the smaller flows in the distribution and end user sites. The research also aims to determine if the device can be used as a standard against which other flow monitors can be calibrated. GRA

CONSTRUCTION AND EVALUATION OF A METAL ION BIOSENSOR Report, 1 Feb. 1990 - 31 Dec. 1992

Lia Tescione and Georges Belfort 15 Jan. 1993 38 p

(Contract N00014-90-J-1715)

(AD-A259775) Avail: CASI HC A03/MF A01

E. coli, genetically engineered with a mercury(II)-sensitive promoter and the lux genes from Vibrio fischeri, were used as microbial sensors for the detection of mercury. Evaluation of this genetic construction was carried out by determining the effects of various parameters on cell suspensions maintained at constant conditions in a small vessel. The strongest light intensities and quickest induction times occurred with cells in the mid-exponential growth phase maintained at 280 C, concentrated to 1 x 10(exp 9) cells/mL, mixed at very fast speeds, and aerated at 2 vvm (volume of air per volume of culture per minute) during light measurement in the small vessel. The sensitivity of these cells to the mercuric ion lied in the range of 0.02-4 micrometer (4-800 ppb) and the total response time was on the order of one hour, depending on the above parameters. The cells exhibited great specificity for mercury. The cells have almost equal specificity for organic and inorganic form of the mercuric ion and responded more weakly to the mercurous ion. A simple, inexpensive, durable miniature probe was constructed and operated using the optimum parameters found in the small vessel as a guide. The range of sensitivity to the mercuric ion detected in the probe was 0.01-4 micrometer when aeration was provided. GRA

N93-23723 Stanford Univ., CA.

BROADBAND ERBIUM-DOPED FIBER SOURCES FOR THE FIBER-OPTIC GYROSCOPE Ph.D. Thesis

Paul Francis Wysocki 1992 284 p

Avail: Univ. Microfilms Order No. DA9234194

The sensitivity of early fiber-optic gyroscopes (FOG) fell short of the theoretical limit. The use of certain configurations, fiber components, and well designed optical sources can help the FOG reach this limit. Sources for the FOG must be broadband, spatially coherent, and high power. They must produce a mean wavelength which is stable with respect to temperature and feedback from system components. Additionally, they must emit at long wavelengths, where silica fibers are insensitive to radiation induced losses. Two approaches to broadband, 1.55 micron erbium-doped fiber sources for the FOG are considered. The most promising approach is the superfluorescent fiber source (SFS), which utilizes amplification of spontaneous emission in a single pass or in two passes through the fiber, without a resonant cavity. Such sources have produced more than 50 percent conversion of pump photons near 980 nm or 1.48 micron to source photons. Laser diode pumping in these pump bands is explored in detail. Depending on fiber length, pump power, pump wavelength, and SFS configuration, emission bandwidths between 8 and 27 nm are measured. The thermal coefficient of the mean wavelength of the SFS is consistently below 10 ppm/C, and near 0 ppm/C for certain design choices. The pump wavelength and pump power are optimized to minimize the dependence of the mean wavelength on these temperature dependent quantities. The detrimental effects of feedback are reduced through optical isolation and the proper choice of FOG configuration. Issues such as the effects of multiple pump modes and loss mechanisms are treated by use of computer simulations. The broadband Er-doped wavelength-swept fiber laser (WSFL) is presented as an alternative to the SFS. This source utilizes an intracavity acousto-optic modulator to sweep the emission of an Er-doped laser across the gain curve of erbium. Theoretical and measured characteristics of such sources are discussed. Emission bandwidths exceeding 20 nm have been demonstrated. The dynamic response of the WSFL and its coherence in an integrating system has been measured. The WSFL has the potential for higher efficiency and for greater control of the emitted spectrum, but it is more complex than the SFS.

CHARACTERIZING THE UNCERTAINTY IN HOLDDOWN POST LOAD MEASUREMENTS

J. A. Richardson (Alabama Univ., Tuscaloosa.) and J. S. Townsend Mar. 1993 32 p

(NASA-TP-3332; M-715; NAS 1.60:3332) Avail: CASI HC A03/MF A01

In order to understand unexpectedly erratic load measurements in the launch-pad supports for the space shuttle, the sensitivities of the load cells in the supports were analyzed using simple probabilistic techniques. NASA engineers use the loads in the shuttle's supports to calculate critical stresses in the shuttle vehicle just before lift-off. The support loads are measured with 'load cells' which are actually structural components of the mobile launch platform which have been instrumented with strain gauges. Although these load cells adequately measure vertical loads, the horizontal load measurements have been erratic. The load measurements were simulated in this study using Monte Carlo simulation procedures. The simulation studies showed that the support loads are sensitive to small deviations in strain and calibration. In their current configuration, the load cells will not measure loads with sufficient accuracy to reliably calculate stresses in the shuttle vehicle. A simplified model of the holddown post (HDP) load measurement system was used to study the effect on load measurement accuracy for several factors, including load point deviations, gauge heights, and HDP geometry. HIGH RESOLUTION DIGITAL THERMOMETER Patent Application

Walter S. Friauf, Thomas R. Clem, and Robert L. Berger 5 Feb. 1992 17 p

(PAT-APPL-7-831-603; PB93-100618) Avail: CASI HC A03/MF A01

A high resolution digital thermometer is disclosed. The thermometer is capable of measuring temperature differences on the order of several micro-degrees centigrade. The device includes a bridge circuit having two thermistors in series. An output of the bridge circuit feeds a signal to an analog-to-digital converter via a high gain amplifier. A computer maintains the balance of the bridge circuit to avoid a situation wherein the range of the analog-to-digital convertor would be exceeded. Because the present invention utilizes two thermistors between which temperature differences are measured, the present invention is particularly advantageous when the two thermistors are in reference and test positions in apparatus for chemical and/or biochemical analysis. For example, in the case of chemical analyzers, one of the thermistors may be positioned in thermal contact with a reaction mixture of interest while the other thermistor may be maintained in thermal contact with a standard or reference solution. CONSTANT FALSE PROBABILITY DATA FUSION SYSTEM Patent Application

Robert J. Pawlak, inventor (to Navy) 6 Nov. 1992 15 p

(AD-D015624; US-Patent-Appl-SN-972339; Navy-Case-73934) Avail: CASI HC A03/MF A01

A system for determining whether a given phenomenon has occurred based on multiple sensor decisions is provided. Each sensor samples input data and attempts to decide if the given phenomenon exists. These sensor decisions are provided to the data fusion processor. The data fusion processor uses a sum of the sensor decisions multiplied by a logarithmic gain indicating the relative reliability of each sensor to generate a test existence metric. The test existence metric is compared to two threshold limits. The results of this comparison are used to provide a final decision indicating the existence of the given phenomenon. An optimization is used to determine the threshold values used in the threshold table to guarantee that the false alarm rate and the data fusion processor is constant, even in cases where data from some sensor is missing. CALIBRATION OF A STANDARD TRANSDUCER USING A LASER INTERFEROMETER (TTCP CALIBRATION ROUND-ROBIN)
Andre Moreau 21 Sep. 1992 19 p
(NRC-34387; IMI92RIS-11731-1057-G; CTN-93-60707) Avail: CASI HC A03/MF A01

A 10-MHz piezoelectric transducer with a half-inch diameter element and square gold target of 4.0 mm on a side was used in an interlaboratory project which consisted of measuring the amplitude of vibration of a standard transducer using a laser interferometer. The work should lead to the establishment of a reproducible procedure for the calibration of laser interferometric systems used for displacement measurements. The experimental setup included a pulse/frequency generator for generating continuous excitation and a heterodyne Michelson interferometer with associated electronics. Three calibration methods were compared. The acoustic amplitude was measured as a function of horizontal position. The measurement error on the acoustic amplitude of a particular data point is estimated at + or - 1 picometer. The reproducibility agrees with the estimated measurement errors. Acoustic amplitude was also studied as a function of excitation voltage. To reduce the large variability in acoustic amplitude with position on the transducer surface, a special transducer assembly with reduced internal reflections was designed; preliminary tests show amplitude could be made uniform to within 10-20 percent over distances of several mm. This could probably be improved with further work. CISTI

MICROELECTRONIC AND MICROMECHANICAL SENSORS AND ACTUATORS IN CMOS TECHNOLOGY: A NOVEL SCHEME TOWARD S REGULARIZATION AND INTEGRATION Ph.D. Thesis
Meenakshinathan Parameswaran Edmonton, Alberta Univ. of Alberta 1990 143 p
(ISBN-0-315-60192-2; CTN-93-60646) Copyright Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada HC

Inherent features of commercial complementary metal oxide semiconductor (CMOS) technology have been found to be ideally suited for microsensor fabrication. Based on these features, a special sensor layout design procedure has been introduced to achieve complete compatibility with the CMOS technology without altering any of its process sequences. Under this scheme, fabrication of sensors and actuators is possible using only a layout design step and a single post-processing step, eliminating the need for customized fabrication and establishing a direction for regularizing sensor fabrication as it exists in current IC technology. Realization of integrated sensor systems with on-chip electronics becomes readily feasible since the circuit forming capabilities of the CMOS process remain unaffected. Several devices have been successfully fabricated and tested using this scheme, including integrated humidity sensors and micromechanical structures. Functional devices such as gas flow sensors, radiation sources and electrothermal microactuators have also been realized. The on-chip circuit integration capabilities have been demonstrated by various designs and tests. A simple analytical scheme has been developed to model the thermally isolated micromechanical structures, and modelling results are compared to experimental results. Author (CISTI)

THE SSIMT: A CMOS BASED MAGNETIC SENSOR Ph.D. Thesis
Tom Smy Edmonton, Alberta Univ. of Alberta 1990 165 p
(ISBN-0-315-60334-8; CTN-93-60647) Copyright Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, J8X 3X2, Canada, HC

The experimental analysis and an analytical model of a novel microelectronic magnetic sensor are presented. This device is called a suppressed sidewall injection magneto transistor (SSIMT) and is manufactured using standard CMOS technology. The SSIMT has produced the highest sensitivities reported for a linear magneto transistor. The analytical model, based on the assumption of the dominance of carrier deflection as the operating mechanism, successfully predicts the bias dependence of the SSIMT and provides considerable insight into the physical cause of the very high measured sensitivities. Various devices are characterized experimentally and the SSIMT is operated under two different biasing conditions. The SSIMT is systematically compared to a simpler, more traditional magneto transistor in order to determine the effect of its unique structure on the magnetic behavior of the collector currents. The structure of the SSIMT provides an opportunity for analyzing the relative roles, in the magnetic operation of the device, of simple current deflection and the modulation of the emitter injection by a Hall field in the base region. An experimental study of the two effects determines carrier deflection to be the dominant mechanism of magnetic operation. Author (CISTI)

DESIGN AND FABRICATION OF DAMMANN GRATINGS TO ILLUMINATE A TIME-INTEGRATING CORRELATOR Final Technical Report
Alain Beauregard Aug. 1991 14 p
(Contract DSS-W7714-1-9515/01-ST)
(CTN-93-60700) Avail: CASI HC A03/MF A01

Dammann gratings are a type of binary phase computer generated hologram with a periodic fringe structure. Work was carried out to design and fabricate a Dammann grating to be used as a precision beamsplitter for the illumination of a time integrating correlator. The production process is described in three steps: design of the diffractive structure; recording of the diffractive structure by electron beam writing; and recording of the Dammann gratings by micro lithographic techniques. The optimal design of the grating features was determined by numerical solution. It was determined that the best solution was a single transition period with exact phase inversion; since the grating period was 10.2 microns, the feature width was 5.1 microns. Taking into account the refractive index of the photoresist layer, the height of the feature was calculated at 0.49 microns. In recording the grating, parameters such as exposure time, developer composition, development temperature, and etching time had to be adjusted to achieve a satisfactory grating profile. The optical performances of the final gratings were determined and the overall specifications were met, except for diffraction efficiencies of the 0 and + or - 2 orders which were slightly more intense than expected. There seems to be a practical limitation in this case. CISTI

EXCIMER LASER SURFACE MODIFICATION: PROCESS AND PROPERTIES
T. R. Jervis, M. Nastasi, and J. P. Hirvonen 1992 13 p Presented at the Materials Research Society Meeting, Pittsburgh, PA, 3 Nov. - 4 Dec. 1992
(Contract W-7405-eng-36)
(DE93-003726; LA-UR-92-3406; CONF-9211127-1) Avail: CASI HC A03/MF A01

Surface modification can improve materials for structural, tribological, and corrosion applications. Excimer laser light has been shown to provide a rapid means of modifying surfaces through heat treating, surface zone refining, and mixing. Laser pulses at modest power levels can easily melt the surfaces of many materials. Mixing within the molten layer or with the gas ambient may occur, if thermodynamically allowed, followed by rapid solidification. The high temperatures allow the system to overcome kinetic barriers found in some ion mixing experiments. Alternatively, surface zone refinement may result from repeated melting-solidification cycles. Ultraviolet laser light couples energy efficiently to the surface of metallic and ceramic materials. The nature of the modification that follows depends on the properties of the surface and substrate materials. Alloying from both gas and predeposited layer sources has been observed in metals, semiconductors, and ceramics as has surface enrichment of Cr by zone refinement of stainless steel. Rapid solidification after melting often results in the formation of nonequilibrium phases, including amorphous materials. Improved surface properties, including tribology and corrosion resistance, are observed in these materials. DOE

MOLECULAR DESIGN CONCEPT FOR X RAY LASER RESEARCH
C. K. Rhodes, T. S. Luk, A. McPherson, and K. Boyer 10 Dec. 1992 16 p
(Contract DE-FG02-91ER-12108)
(DE93-004561; DOE/ER-12108/2) Avail: CASI HC A03/MF A01

The goal of this program is the construction of an x-ray laser in the kilovolt regime. Recent experimental results indicate that a new technique for the generation of strong amplification of x-ray wavelengths is feasible. It involves the combination of (1) a new ultrahigh brightness subpicosecond laser technology and (2) a recently discovered unique mode of strong-field interaction, particularly applicable to molecules. A concept of molecular x-ray design emerges from the considerations which matches the mode of excitation to the structure of the molecular system. The molecular approach enables the combination of very highly electronically excited conditions with an environment characteristic of dense cold matter, a general situation exceptionally conducive to x-ray amplification. Both high efficiency and wavelength tunability are intrinsic features of this method. Recent results discussed are revealing important characteristics of the molecular strong-field coupling pertinent to this goal. A continued program of research is proposed to evaluate this method for the production of x-ray amplification in the kilovolt region. DOE

ELECTRO-OPTIC FRAME PHOTOGRAPHY WITH PULSED RUBY ILLUMINATION
L. L. Shaw, S. A. Muelder, A. T. Rivera, J. L. Dunmire, and R. D. Breithaupt 11 Nov. 1992 16 p Presented at the 20th International Congress on High Speed Photography and Photonics, Victoria, British Columbia, 25-26 Sep. 1992
(Contract W-7405-eng-48)
(DE93-005819; UCRL-JC-112232; CONF-9209188-7) Avail: CASI HC A03/MF A01

By combining the attributes of electro-optic shuttering and pulsed laser illumination in a large format camera system, we have developed a multi-frame image converter camera with a laser illuminator that produces sequential photographs of fast phenomena with very high resolution. The combination of the large size image plane (75 mm), short exposure time per frame (minimum 12-15 ns), and monochromatic laser illumination provides clear, sharp, front-lit images of surfaces and shapes with no degradation by luminous air shocks or motion blur. The unique modular design of the camera and the laser allow for a variety of configurations and applications. The current camera system produces eight independent pictures or four stereo pairs. A Q-switched ruby laser with multiple pulse capability provides individual illumination for each frame. This system has photographed a variety of fast phenomena including the first stereo sequential photographs of the initial formation and early time history of high velocity shaped-charge jets. DOE

HIGH-POWER OPTICAL COATINGS FOR A MEGA-JOULE CLASS ICF LASER
M. R. Kozlowski, I. M. Thomas, J. H. Campbell, and F. Rainer Nov. 1992 17 p Presented at the Society of Photo Optical Instrumentation Engineers (SPIE/EOS) International Symposium on Optical Design Systems, Berlin, Germany, 14-19 Sep. 1992
(Contract W-7405-eng-48)
(DE93-005821; UCRL-JC-109735; CONF-9209295-1) Avail: CASI HC A03/MF A01

As a consequence of advancements in Inertial Confinement Fusion research, LLNL is developing plans for a new 1.5 to 2 mega-joule solid-state Nd:glass laser designed to achieve fusion ignition. The new design is possible in part due to advances in optical coatings suitable for high power laser systems. High damage threshold mirrors and polarizers are comprised of electron beam deposited dielectric multilayers. Subthreshold illumination, or laser conditioning, of the multilayer coatings results in an increase in the damage thresholds by factors of 2 to 3 at 1.06 microns,

thus meeting the fluence requirements of the advanced architecture. For anti-reflective coatings, protective organic coatings for non-linear crystals, and phase plates for beam smoothing, sol-gel films provide high damage thresholds coatings at low cost. DOE

OFTEN OVERLOOKED ELECTRICAL HAZARDS COMMON IN MANY LASERS
D. K. Thomas 1992 6 p Presented at the International Laser Safety Conference on Non-Beam Hazards, Cincinnati, OH, 1-4 Dec. 1992
(Contract W-7405-eng-36)
(DE93-003856; LA-UR-92-3837; CONF-921233-1) Avail: CASI HC A02/MF A01

One of the more dangerous non-beam hazards associated with laser work is electricity, often found in lethal doses within laser housings. However, some of the paths by which laser personnel may be exposed to this hazard are often overlooked by laser safety officers (LSO's), laser workers and laser manufacturers. One of the often overlooked paths by which laser personnel may come into contact with hazardous electrical current is due to a safety design deficiency prevalent in many laser products. This is that many lasers have performance adjustments within the protective housing that may obligate or entice personnel to perform potentially hazardous manipulative operations with the housing open; often with the safety interlocks defeated and the device fully energized. LSO's, laser workers, and laser manufacturers need to be aware of this hazard and should carefully analyze their lasers to determine if this exists within the lasers they use or manufacture. In most cases simple measures can be taken to prevent a potentially shocking laser experience. DOE

SELF-AMPLIFIED SPONTANEOUS EMISSION FOR SHORT WAVELENGTH COHERENT RADIATION
K. J. Kim and M. Xie Sep. 1992 16 p Presented at the 14th International Free Electron Laser Conference, Kobe, Japan, 23-28 Aug. 1992
(Contract DE-AC03-76SF-00098)
(DE93-004724; LBL-32288; ESG-187; CONF-9208142-18) Avail: CASI HC A03/MF A01

We review the recent progress in our understanding of the self-amplified spontaneous emission (SASE), emphasizing the application to short wavelength generation. Simple formulae are given for the start-up, exponential gain and the saturation of SASE. Accelerator technologies producing high brightness electron beams required for short wavelength SASE are discussed. An example utilizing electron beams from a photocathode-linac system to produce 4nm SASE in the multigigawatt range is presented. DOE

SELF-FOCUSING OF BROADBAND LASER PULSES IN DISPERSIVE MEDIA
M. D. Feit and J. A. Fleck, Jr. Dec. 1992 17 p
(Contract W-7405-eng-48)
(DE93-007369; UCRL-ID-112523) Avail: CASI HC A03/MF A01

We have modeled the propagation in a nonlinear dispersive medium of high power laser beams having spectral bandwidth with randomly phased components. Such pulses exhibit temporal noise which generally increases the effect of self focusing compared to single frequency pulses with the same average intensity. However, it is found that dispersive effects are greatly enhanced by the spectral broadening from self-phase-modulation. The combination of self-phase-modulation and dispersion can actually raise the threshold for self-focusing with increasing pulse bandwidth, although not to the level found for a single frequency beam. DOE

DESIGN AND MANUFACTURE OF OPTICAL SYSTEM FOR USE IN UV LITHOGRAPHY WITH THE FREE ELECTRON LASER
D. A. Byrd, V. K. Viswanathan, G. L. Woodfin, B. W. Horn, V. J. Lazazzera, and R. A. Schmell 1992 24 p Presented at the 17th Annual Society of Photo-Optical Instrumentation Engineers (SPIE) International Conference on Infrared and Millimeter Wave Sources, Pasadena, CA, 14-18 Dec. 1992
(Contract W-7405-eng-36)
(DE93-005440; LA-UR-92-4132; CONF-921217-3) Avail: CASI HC A03/MF A01

The imaging of sub-micron features using the Free Electron Laser (FEL) operating at 248nm is a current project at Los Alamos National Laboratories. The optical transfer systems which were designed to relay the ultra-violet (UV) optical output of the FEL resulting in expected imaged feature sizes in the 0.3-0.5 microns range are described. Nearly all optical subsystems are reflective, allowing the use of any optical wavelength, once the coatings were optimized. All refractive optics were UV Grade FuSi. The optical design, engineering, and the actual manufacture of the various component systems are described along with some experimental results. DOE

LASER SAFETY TRAINING PROGRAMS FOR A LARGE AND DIVERSE RESEARCH AND DEVELOPMENT LABORATORY
W. E. Stocum 1992 7 p Presented at the International Laser Safety Conference on Non-Beam Hazards, Cincinnati, OH, 1-4 Dec. 1992
(Contract DE-AC04-76DP-00789)
(DE93-006291; SAND-92-2422C; CONF-921233-2) Avail: CASI HC A02/MF A01

Sandia National Laboratories is a large multiprogram Research and Development laboratory which is operated by a contractor for the US Department of Energy. In the Laboratories, lasers are both the subject of research and the tools that are used in other research, development, and testing activities. Since 1979, laser safety training has been the primary focus of the Laboratories' laser safety program. Approximately 1100 personnel have been trained in formal courses during that time period. The formal course, presented on site by a contractor, consists of two full days of instruction. The course contents include the following topics: Laser technology and safety overview; Federal and ANSI laser standards summaries; Biological effects of laser radiation; Classification of lasers; Laser hazard analysis; Review of ANSI Z136.1 control measures; Laser eye protection. Recent emphasis on regulatory requirements, conduct of operations, and quality management has revealed a need to change the laser safety training curriculum. A new course for users of low power lasers (Class 2 and 3a) is being developed. A refresher course, a management awareness (self-study) course, and major changes in the current course are planned. DOE

HIGH POWER DIODE PUMPED SOLID STATE LASERS
R. Solarz, G. Albrecht, R. Beach, and B. Comaskey 25 Nov. 1992 10 p Presented at the International Conference of Lasers and Opto-Electronics, Beijing, China, 16-18 Oct. 1992
(Contract W-7405-eng-48)
(DE93-005818; UCRL-JC-108889; CONF-9210281-1) Avail: CASI HC A02/MF A01

Although operational for over twenty years, diode pumped solid state lasers have, for most of their existence, been limited to individual diodes pumping a tiny volume of active medium in an end pumped configuration. More recent years have witnessed the appearance of diode bars, packing around 100 diodes in a 1 cm bar which have enabled end and side pumped small solid state lasers at the few Watt level of output. This paper describes the subsequent development of how proper cooling and stacking of bars enables the fabrication of multi kill average power diode

pump arrays with irradiances of 1 kw/cm peak and 250 W/cm(exp 2) average pump power. Since typical conversion efficiencies from the diode light to the pumped laser output light are of order 30 percent or more, kW average power diode pumped solid state lasers now are possible. DOE

APPLICATION OF 10 GeV ELECTRON DRIVEN X RAY LASER IN GAMMA RAY LASER RESEARCH
J. C. Solem 1992 8 p Presented at the Scientific Uses of X Ray Laser, Sanford, CA, 21 Oct. 1992
(Contract W-7405-eng-36)
(DE93-003775; LA-UR-92-3695; CONF-9210240-1) Avail: CASI HC A02/MF A01

The proposed short wavelength coherent light source driven by the SLAC 3 km linac might be used to induce transitions between nuclear isomeric states. If an isotope were found with energetically adjacent isomeric states, one short-lived and one long-lived, and it were possible to separate and concentrate the long-lived species, and other nuclear and solid-state parameters were favorable, it might be possible to convert sufficient population to the short-lived state to realize gamma-ray lasing. Even if the x-ray intensity were insufficient, study of such driven transitions would be quite valuable. DOE

CALCULATION OF 3-D FREE ELECTRON LASER GAIN: COMPARISON WITH SIMULATION AND GENERALIZATION TO ELLIPTICAL CROSS SECTION
Yong Ho Chin, Kwang-Je Kim, and Ming Xie Aug. 1992 10 p Presented at the 14th International Free Electron Laser Conference, Kobe, Japan, 23-28 Aug. 1992
(Contract DE-AC03-76SF-00098)
(DE93-004768; LBL-32286; ESG-186; CONF-9208142-16) Avail: CASI HC A02/MF A01

In previous work, we have derived a dispersion relation for the free electron laser (FEL) gain in the exponential regime by taking into account the diffraction and electron's betatron oscillation. Here, we compare the growth rates obtained by solving the dispersion relation with those obtained by simulation calculation for the waterbag and the Gaussian models for the electron's transverse phase space distribution. The agreement is found to be good except for the limiting case where the Rayleigh length is much longer than the gain length (1-D limit). We also generalize the analysis to the case where the electron beam cross section is elliptical, as is usually the case in storage rings, and derive the first-order dispersion relation. DOE

NEW ANALYSIS OF KrF PICOSECOND PULSE EXPERIMENT
D. E. Hanson and C. W. Patterson 23 Oct. 1992 8 p Presented at the 3rd Workshop on KrF Laser Technology, Abingdon, England, 3-6 Nov. 1992
(Contract W-7405-eng-36)
(DE93-003805; LA-UR-92-3597; CONF-9211141-1) Avail: CASI HC A02/MF A01

A new model for analyzing the behavior of the KrF laser medium in response to a short (approximately 1 ps) saturating pulse is presented. For pulse durations much less than the mean collision time, the orientation of the KrF angular momentum vector, J, is fixed in space and the rotational M levels are inherently unmixed. The usual assumption of a single stimulated emission cross section, is replaced by one which includes a distribution of cross sections (and populations) which arise from the projection of the dipole along the laser polarization axis. We find that a simple, Franz-Nodvik analysis, using a single saturation fluence parameter, is inaccurate in the short pulse regime. DOE

N93-23307# Argonne National Lab., IL.
CO2 LASER BEAM PROPAGATION WITH ZnSe OPTICS
K. H. Leong, Yi Liu, and D. J. Holdridge 1992 11 p Presented at the International Congress on Application of Laser and Electro-Optics, Orlando, FL, 25-29 Oct. 1992
(Contract W-31-109-eng-38)
(DE93-002927; ANL/EP/CP-76191; CONF-9210217-2) Avail: CASI HC A03/MF A01

Beam propagation characteristics of ZnSe optics used in kiloWatt power CO2 laser aided material processing applications are determined using the Prometec Laser Beam Analyzer. The laser used was a Rofin Sinar RS6000 CO2 laser with mode aperturing. Beam power varied from 500W to 6300W and beam modes used were TEM(sub 00), TEM(sub 01), TEM(sub 10), and TEM(sub 20). Both transmissive and reflective optics were examined. The ZnSe lenses tested included meniscus, diffractive, and cylindrical lenses of 5 in. focal length and a 10 in. focal length integrating lens. Reflective optics included an integrator and a 5 in. focal length parabolic mirror for welding. Parameters obtained included beam propagation profiles, intensity profiles, depth of focus, spot size, and back focal length. A subset of the data obtained is presented here. Details of the work will appear in a full length paper. DOE

VISIBLE CHEMICAL LASERS: REACTIONS OF METASTABLE OXYGEN AND THE STUDY OF THE RED YOSHIDA REACTION Final Report
Roger Bacis 31 May 1992 57 p
(Grant AF-AFOSR-0235-91)
(AD-A260181) Avail: CASI HC A04/MF A01

During the period covered by the U.S. Air Force Grant we have identified the CuCl2 molecule as responsible for the I.R. and strong red emission in the 'Yoshida reaction.' The deep potential well of the CuCl2 ground state favors population inversion in the two involved excited states ((sup 2)delta(sub g) and (sup 2)Pi(sub u)). The lifetime of the highest excited electronic state (sup 2)Pi(sub u) makes laser action unlikely at 700 nm. But the metastable (sup 2)delta(sub g) state could reasonably be expected to sustain a population inversion. GRA

R. J. Wallace, W. H. Goldstein, B. G. Wilson, and J. K. Nash Dec. 1992 25 p Presented at the Meeting of the Division of Plasma Physics of the American Physical Society, Seattle, WA, 16-20 Nov. 1992
(Contract W-7405-eng-48)
(DE93-005822; UCRL-JC-111286; CONF-921103-6) Avail: CASI HC A03/MF A01

We have conducted an extensive series of experiments on the Nova laser to measure hydrodynamic instabilities in planar foils accelerated by x-ray ablation. Single mode experiments allow a measurement of the fundamental growth rates from the linear well into the nonlinear regime; multimode foils allow an assessment of the degree of mode coupling; and surface-finish experiments allow a measurement of the evolution of a broad spectrum of random initial modes. Experimental results and comparisons with theory and simulations are presented. DOE

STUDIES OF TUNABLE, HIGH POWER EXCIMER LASERS Ph.D. Thesis
Thomas Hofmann 1992 137 p
Avail: Univ. Microfilms Order No. DA9234397

A detailed investigation of tunable, high power excimer lasers, particularly of the electron-beam pumped XeF(C to A) laser, is presented. A numerical model is described which simulates the performance of such lasers. The output energy and temporal profile of an injection controlled XeF(C to A) excimer laser were successfully predicted for a wide range of experimental conditions. The XeF(C to A) excimer laser was demonstrated as a wideband tunable source of radiation capable of accessing a wavelength range from 455 to 530 nm. A high energy output of 1.2 J per pulse at a repetition rate of 1 Hz was accomplished by the use of a transverse gas flow cell. Injection controlled operation provided a narrow laser linewidth of 0.001 nm and three times diffraction limited spatial beam quality. Stimulated Raman scattering of the XeF(C to A) laser in hydrogen and liquid nitrogen was used to generate continuously tunable radiation between 525 and 650 nm with pulse energies exceeding 100 mJ. An energy conversion efficiency of 38 percent and a peak power of 35 MW were achieved. The XeF(C to A) excimer transition was characterized as a new gain medium for ultrashort pulse amplification. A gain bandwidth of 60 nm, as measured with 100 ps pulses, and a saturation energy density of 50 mJ/sq cm for 250 fs pulses constitute a 20-fold improvement over other short pulse excimer laser systems. An ultrahigh power, short pulse amplifier system was designed and built, based on the gain measurements. An unstable resonator, particularly adapted to low gain conditions and high temporal purity was developed for the XeF(C to A) excimer amplifier. A maximum output energy of 275 mJ was obtained for amplified 250 fs pulses, resulting in terawatt peak power. A spatial beam quality of 2.4 times the diffraction limit was measured, which makes it possible to achieve an intensity of larger than 1 10(exp 19) W/sq cm in a focused beam. Therefore, the XeF(C to A) excimer laser amplifier can be used in an exciting new field of studies involving the interaction of ultrahigh intensity light with matter.

FALCON REMOTE LASER ALIGNMENT SYSTEM
T. W. Hamilton and G. A. Hebner 1993 19 p
(Contract DE-AC04-76DP-00789)
(DE93-006448; SAND-92-2393) Avail: CASI HC A03/MF A01

The FALCON Remote Laser Alignment System is used in a high radiation environment to adjust an optical assembly. The purpose of this report is to provide a description of the hardware used and to present the system configuration. Use of the system has increased the reliability and reproducibility of data as well as significantly reducing personnel radiation exposure. Based upon measured radiation dose, radiation exposure was reduced by at least a factor of two after implementing the remote alignment system. DOE

The physics and engineering of semiconductor electrical contacts and the importance of low resistance ohmic contacts for the best performance from electronic devices is discussed. A simple method is used to deduce the resistance of the electrical contacts and the bulk semiconductor. The fabrication process for P+ GaAs contacts is discussed. Test results are presented for the resistance of the metal electrodes, P+ GaAs bulk, the intrinsic contact resistance, and the temperature dependence of the metal and P+ GaAs. The distributed impedance of the contact structure for semiconductor lasers is discussed. GRA

SELECTIVE REACTIVITY, ULTRAFAST ENERGY TRANSFER AND THE DEVELOPMENT OF CHEMICALLY PUMPED VISIBLE LASERS Final Report, 1 Aug. 1989 - 30 Sep. 1992
James L. Gole 16 Nov. 1992 53 p
(Contract DAAL03-89-K-0140)
(AD-A260123; G41-618) Avail: CASI HC A04/MF A01

Two successful approaches to the formation of electronically inverted atomic diatomic configurations based on (1) highly efficient near resonant intermolecular energy transfer, and (2) highly efficient and selective fast direct chemical reaction are outlined. Near resonant energy transfer pumping from selectively formed metastable states of SiO and GeO is used to form thallium, gallium, sodium, and potassium atom laser amplifiers at lambda = 535, 417, 569, 616, 819, and 581 nm. The gain condition in the Tl, Ga, Na, and K systems forms the basis for full cavity oscillation on the Tl 7(sup 2)S(sub 1/2)- 6(sup 2)P(sub 3/2) transition at 535 nm and the Na 4d(sup 2)D - 3p(sup 2)P transition at 569 m. The extremely high cross section Na(sub n) (n=2,3) - X(Cl,Br,I) reactions are employed to create a continuous electronic population inversion based on the chemical pumping of sodium dimer (Na2). Optical gain through stimulated emission was demonstrated in select regions close to 527, 492, and 460 nm. The considered amplifiers are being optimized and modeled with a focus to increasing amplifier gain length and amplifying medium concentration so as to facilitate their conversion to visible chemical laser oscillators. The study of addition analog systems suggests that the two concepts considered wil be generic. GRA

EXPERIMENTAL AND THEORETICAL STUDY OF THE IODINE-SINGLET OXYGEN REACTION FOR USE IN A HIGH POWER CHEMICAL LASER (COIL) Ph.D. Thesis - Paris-Sud Univ., 1991 [ETUDE EXPERIMENTALE ET THEORIQUE DE LA REACTION IODE-OXYGENE SINGULET EN VUE DE LA REALISATION D'UN LASER CHIMIQUE DE PUISSANCE]
Bruno Barnault 1992 218 p In FRENCH
(ONERA-P-1992-3; ETN-93-93522) Avail: CASI HC A10/MF A03

The Chemical Oxygen Iodine Laser (COIL) works with the I(2 P 1/2) to I(2 P 3/2) transition of the atomic iodine. Its wavelength is 1.315 micrometers. The chemically produced metastable oxygen O2(1 Delta g) provides the energy needed to dissociate the molecular iodine and achieve the population inversion. The oxygen-iodine medium and a one kilowatt COIL project are presented. The various multicollisional processes proposed to explain the iodine dissociation are described. All of them involve the high vibrational levels I2 (X, V less than or equal to 43) as intermediate species. Absolute density measurements were made of these levels, by exictation spectroscopy. The measured values are in good agreement with the reaction constants and with the proposed processes. ESA

N93-24191 Stanford Univ., CA.
HIGH-RESOLUTION FREE-ELECTRON LASER SPECTROSCOPY Ph.D. Thesis
Eric Brent Szarmes 1992 155 p
Avail: Univ. Microfilms Order No. DA9234170

The broad and continuous turnability of the rf linac-driven free-electron laser (FEL), coupled with its high power picosecond time structure, has greatly enhanced the research capabilities in the field of infrared spectroscopy. However, the duration of the optical pulses is often too long to probe ultrafast processes that occur on time scales of a few tens to a few hundreds of femtoseconds, and the spectral structure of the optical beam, with closely spaced longitudinal modes in a bandwidth determined by the Fourier transform of the short pulses, poses a significant limitation of experiments requiring high spectral resolution. The temporal resolution can be improved by operating the FEL with electron pulses whose energy varies linearly with time; the resulting optical pulses possess substantial

frequency chirps and are susceptible to pulse compression in an external dispersive delay line. The spectral resolution can be enhanced by using an intracavity Michelson interferometer to couple successive optical pulses so that they build up from noise with a definite phase relationship; the longitudinal modes in the output beam are then separated by the rf frequency of the linac and can be individually filtered for applications in high resolution spectroscopy. In this dissertation, I develop small signal analyses for each of these modes of operation, and report the results of numerical pulse propagation simulations whose parameters were chosen to guide the design of feasible experiments on the Mark III FEL. Chirped-pulse simulations using modest energy chirps have demonstrated a x15 compression ratio at saturated power levels for 3.4 ps optical pulses at 3.35 microns, and coupled pulse simulations have indicated substantial longitudinal mode reduction on microsecond time scales. I also develop a simplified derivation of the FEL coupled mode equations using conventional mode locked laser theory, and solve them numerically in the frequency domain to describe the detuning properties of the Michelson resonator FEL. Finally, I report the first operation of a Michelson mirror resonator on the Mark III FEL, and present indirect evidence for phase locked operation using a beamsplitter reflectance of only 1.4 percent. (AD-A260388) Avail: CASI HC A03/MF A01

In this report, we present the results of our search for lasing schemes using a collisional pumping mechanism of active level population suitable for a capillary discharge plasma. We have performed atomic data calculations which give us accurate figures for energy level positions for Ne-like Ar, including highly excited levels which have not been studied experimentally and which are of significant interest for short-wavelength lasing. We also calculated radiative transitions probabilities as well as branch coefficients for transitions of interest for lasing. The calculations were performed not only for Ne-like ions but also for Ni-like ions of krypton and molybdenum, as the Ni-like scheme seems to be promising for scaling to lower wavelengths. Using the results of these calculations, we are able to predict possible laser lines and to estimate their relative intensities. GRA

PROTOTYPING OF TWO-BEAM LASER INTERFEROMETER FOR MEASUREMENT OF OPTICAL TURBULENCE ALONG EXTENDED PATHS M.S. Thesis
Carl S. Barbour Dec. 1992 46 p
(AD-A260229) Avail: CASI HC A03/MF A01

This thesis demonstrates a proof-of-concept experimental validation of a prototype two-beam, division of wavefront laser interferometer that provides real-time measurement of the optical path difference, and subsequent phase distortion, caused by atmospheric turbulence along an extended horizontal path. Prototype's signal processing incorporates use of specialized phase comparator circuit developed by author's advisor, D.S. Davis. Photographs and results cited of the prototype' receiver's output offer proof of the validity of the basic design. Further research of this technology is expected to support future laser/adaptive optics long range weapon applications. GRA

(AD-A260028; AD-E201288; PL-TR-92-1049) Avail: CASI HC A08/MF A02

This dissertation is intended to study the effects of self-pumped phase-conjugate feedback on a semiconductor laser. The concept of the unidirectional ring passive phase-conjugate mirror (PPCM) external cavity semiconductor laser (URECL) is introduced. This device consists of a laser diode coupled to a self-pumped ring phase-conjugate mirror. The URECL is compared and contrasted with a conventional external cavity semiconductor laser (CECL) that models a simple dielectric reflector for the feedback device, and with a phase-conjugate external cavity laser (PCECL) that models theoretically ideal phase conjugation as the feedback mechanism. The effective reflectivities for the different types of reflectors are derived and compared. The rate equations for all three cases are derived and plotted for comparison. The boundary conditions for the phase-conjugate cases are derived and experimental evidence is used to support the claim that a 2npi (n being a variable integer) phase shift occurs for the PCECL and URECL. The multimode behavior of the free running laser, the CECL, and the URECL are compared. Experimental evidence of coherence collapse is presented and discussed. The dynamic rate equations are given and contrasted. The beam quality of the unidirectional ring PPCM is considered. GRA

We report the observation of stimulated emission pumping spectra in the NCO radical formed in a supersonic free jet expansion by the reaction between photolytically generated CN radicals and O2. The spectra give rotationally resolved information on high lying vibrational levels that are difficult or impossible to detect by conventional single photon spectroscopic techniques. These new data provide detailed insight into the Renner-Teller, spin-orbit and Fermi-resonance coupling in the molecule. They also provide a solid basis for future state-selected chemical and dynamical studies involving this important radical species. DOE

An anchor nut insert is provided having external threads for engaging an internally threaded receptacle of a fixture to be installed. The fixture also has two side wings flanking the receptacle and having fastener holes. An insert driver is provided having a projecting blade which engages a slot in the anchor nut insert for driving the insert. A guide member, such as a wire, passes through symmetry axes of the anchor nut insert and insert driver such that the anchor nut insert is located between the insert driver and a first terminal end of the guide wire. A swag is provided on this terminal end to prevent the anchor nut insert and insert driver from sliding off the end. The fixture with the installed anchor nut insert is fed through the central hole in a structure wall having a blind side. The fixture is rotated until the wing holes are aligned with side holes in the wall and then the fixture is pulled flush against the blind side via the guide wire. Fasteners are then inserted through the hole and the anchor nut insert removed via the driver, exposing the fixed threaded receptacle for engagement as desired.

OVERVIEW OF ADVANCED TURBINE SYSTEMS PROGRAM
H. A. Webb and R. A. Bajura 1992 12 p Presented at the US Department of Energy Contractors Review Meeting on Coal-Fueled Heat Engines, Advanced PFBC and Gas Stream Cleanup Systems, Morgantown, WV, 27-28 Oct. 1992
(DE93-003193; DOE/METC-C/93/7042; CONF-921034-2) Avail: CASI HC A03/MF A01

The US Department of Energy initiated a program to develop advanced gas turbine systems to serve both central power and industrial power generation markets. The Advanced Turbine Systems (ATS) Program will lead to commercial offerings by the private sector by 2002. ATS will be developed to fire natural gas but will be adaptable to coal and biomass firing. The systems will be: highly efficient (15 percent improvement over today's best systems); environmentally superior (10 percent reduction in nitrogen oxides over today's best systems); and cost competitive (10 percent reduction in cost of electricity). The ATS Program has five elements. Innovative cycle development will lead to the demonstration of systems with advanced gas turbine cycles using current gas turbine technology. High temperature development will lead to the increased firing temperatures needed to achieve ATS Program efficiency goals. Ceramic component development/demonstration will expand the current DOE/CE program to demonstrate industrial-scale turbines with ceramic components. Technology base will support the overall program by conducting research and development (R&D) on generic technology issues. Coal application studies will adapt technology developed in the ATS program to coal-fired systems being developed in other DOE programs. DOE

ADVANCED ROTORCRAFT TRANSMISSION (ART) PROGRAM Final Report
Gregory F. Heath and Robert B. Bossler, Jr. (Lucas Western, Inc., City of Industry, CA.) Jan. 1993 222 p
(Contract NAS3-25454; DA Proj. 1L1-62211-A-47-A; RTOP 505-62-OK)
(NASA-CR-191057; ARL-CR-14; NAS 1.26:191057) Avail: CASI HC A10/MF A03

Work performed by the McDonnell Douglas Helicopter Company and Lucas Western, Inc. within the U.S. Army/NASA Advanced Rotorcraft Transmission (ART) Program is summarized. The design of a 5000 horsepower transmission for a next generation advanced attack helicopter is described. Government goals for the program were to define technology and detail design the ART to meet, as a minimum, a weight reduction of 25 percent, an internal noise reduction of 10 dB plus a mean-time-between-removal (MTBR) of 5000 hours compared to a state-of-the-art baseline transmission. The split-torque transmission developed using face gears achieved a 40 percent weight reduction, a 9.6 dB noise reduction and a 5270 hour MTBR in meeting or exceeding the above goals. Aircraft mission performance and cost improvements resulting from installation of the ART would include a 17 to 22 percent improvement in loss-exchange ratio during combat, a 22 percent improvement in mean-time-between-failure, a transmission acquisition cost savings of 23 percent of $165K, per unit, and an average transmission direct operating cost savings of 33 percent, or $24K per flight hour. Face gear tests performed successfully at NASA Lewis are summarized. Also, program results of advanced material tooth scoring tests, single tooth bending tests, Charpy impact energy tests, compact tension fracture toughness tests and tensile strength tests are summarized. Author (revised)

GTAW PENETRATION BASED ON ELECTRODE TIP LOCATION VERSUS WELD JOINT CENTER LINE
G. J. Daumeyer, III Nov. 1992 37 p
(Contract DE-AC04-76DP-00613)
(DE93-004910; KCP-613-4868) Avail: CASI HC A03/MF A01

Gas Tungsten Arc Welding (GTAW) is often the chosen process for final enclosure welds of heat sensitive electrical and electronic product. GTAW is used to produce welds that satisfy design requirements (usually a penetration requirement) and not expose the product to such high heat that would cause unwanted damage. An important variable in the GTAW process is the location of the Electrode tip over the weld joint center line. This study shows the tolerance of positional location over a narrow scope. Using coupons which represent the W88 container weld joint geometry, penetration vs. electrode tip positional location (offset) is investigated. Results indicate a positional location tolerance of +/- 0.008 in. is acceptable. Several different major components (MC's) supporting various weapons programs require low heat input GTA welds. The electrode tip positional location tolerance is determined by each MC's weld joint tolerances and heat sensitivity. For this short study, the weld joint geometry of a container weld was used. These coupons were welded with the specified weld schedule and one additional weld schedule in order to show the relationship based on both travel speed and gap. Multiple coupon welds were made to eliminate error in the results. Within the scope of this research, a positional tolerance of +/- 0.008 in. of the electrode center over the weld joint center is required. For other MC's this tolerance may be tighter or more relaxed depending upon the specific considerations. DOE

ANALYSIS OF OPERATIONAL, INSTITUTIONAL AND INTERNATIONAL LIMITATIONS FOR ALTERNATIVE FUEL VEHICLES AND TECHNOLOGIES: MEANS/METHODS FOR IMPLEMENTING CHANGES

Jul. 1992 89 p Prepared in cooperation with Public Technology, Inc., Washington, DC, and City of Detroit, MI

(Contract DE-FG02-90CE-27504)

(DE93-005611; DOE/CE-27504/5) Avail: CASI HC A05/MF A01

This project focused upon the development of an approach to assist public fleet managers in evaluating the characteristics and availability of alternative fuels (AF's) and alternative fuel vehicles (AFV's) that will serve as possible replacements for vehicles currently serving the needs of various public entities. Also of concern were the institutional/international limitations for alternative fuels and alternative fuel vehicles. The City of Detroit and other public agencies in the Detroit area were the particular focus for the activities. As the development and initial stages of use of alternative fuels and alternative fuel vehicles proceeds, there will be an increasing need to provide information and guidance to decision-makers regarding differences in requirements and features of these fuels and vehicles. There will be differences in requirements for servicing, managing, and regulating. There will also be misunderstanding and misperception. There have been volumes of data collected on AFV'S, and as technology is improved, new data is constantly added. There are not, however, condensed and effective sources of information for public vehicle fleet managers on vehicle and equipment sources, characteristics, performance, costs, and environmental benefits. While theoretical modeling of public fleet requirements has been done, there do not seem to be readily available 'practical'. There is a need to provide the best possible information and means to minimize the problems for introducing the effective use of alternative fuels and alternative fuel vehicles. DOE

PREDICTION OF THE QUALITY OF RESISTANCE WELDS BY COMPUTER BASED COLOR IMAGE ANALYSIS

M. J. Pechersky, K. A. Zeoli, and P. A. Kestin 1992 15 p Presented at the International Metallographic Society Annual Meeting, Denver, CO, 2-5 Aug. 1992

(Contract DE-AC09-89SR-18035)

(DE93-002402; WSRC-MS-92-051; CONF-9208178-1) Avail: CASI HC A03/MF A01

Experiments which were completed to correlate the quality of electric resistance pinch welds with an automated computer analysis of the weld surface are discussed. The pinch welds were performed on small diameter stainless steel tubes after they were annealed in air at several different temperatures to form an oxide layer on the weld surfaces. The images of the tube bore were collected with a borescope, stored in a computer and analyzed. The analysis consisted of computing a parameter which gave a representation of the color integrated over the inspected region. This color parameter was then used to rank the tubes in order of their relative oxidation level. Once this was performed the tubes were welded and low magnification metallography was performed on the welds. It was found that the color analysis gave a perfect correlation with the oxidation levels and that the weld quality was inversely proportional to the amount of oxidation. It was also shown that the color analysis was robust in the sense that the sorting was independent of the borescope illumination level over a large range for both oxidized and unoxidized stems. Thus, the color parameter chosen was an excellent predictor of the weld quality. DOE

EVALUATION OF AN OIL-DEBRIS MONITORING DEVICE FOR USE IN HELICOPTER TRANSMISSIONS

David G. Lewicki, Donald M. Blanchette (National Defence Headquarters, Ottawa, Ontario.), and Gilles Biron (Quality Engineering Test Establishment, Hull, Quebec.) Aug. 1992 19 p

(DA Proj. 1L1-62211-A-47-A; RTOP 505-63-36)

(NASA-TM-105830; E-7265; NAS 1.15:105830; AVSCOM-TR-92-C-007)

Avail: CASI HC A03/MF A01

Experimental tests were performed on an OH-58A helicopter main-rotor transmission to evaluate an oil-debris monitoring device (ODMD). The tests were performed in the NASA 500-hp Helicopter Transmission Test Stand. Five endurance tests were run as part of a U.S. Navy/NASA/Army advanced lubricants program. The tests were run at 100 percent design speed, 117-percent design torque, and 121 C (250 F) oil inlet temperature. Each test lasted between 29 and 122 hr. The oils that were used conformed to MIL-L-23699 and DOD-L-85734 specifications. One test produced a massive sun-gear fatigue failure; another test produced a small spall on one sun-gear tooth; and a third test produced a catastrophic planet-bearing cage failure. The ODMD results were compared with oil spectroscopy results. The capability of the ODMD to detect transmission component failures was not demonstrated. Two of the five tests produced large amounts of debris. For these two tests, two separate ODMD sensors failed, possibly because of prolonged exposure to relatively high oil temperatures. One test produced a small amount of debris and was not detected by the ODMD or by oil spectroscopy. In general, the ODMD results matched the oil spectroscopy results. The ODMD results were extremely sensitive to oil temperature and flow rate. Author

MODIFIED IMPEDANCE CONTROL FOR ROBOTIC SAW CUTTING: SIMULATION AND IMPLEMENTATION IN THREE DEGREES OF FREEDOM

E. M. Kriikku, D. L. Reynolds (Clemson Univ., SC.), J. J. Carroll (Clemson Univ., SC.), and D. M. Dawson (Clemson Univ., SC.) 1993 8 p Presented at the 5th Topical Meeting on Robotics and Remote Systems, Knoxville, TN, 26-29 Apr. 1993

(Contract DE-AC09-89SR-18035)

(DE93-002162; WSRC-MS-92-371; CONF-930403-1) Avail: CASI HC A02/MF A01

The Savannah River Site (SRS) production and decommissioning operations produce solid radioactive transuranic (TRU) waste. This waste must be repackaged and sent to the Waste Isolation Pilot Plant (WIPP) for permanent disposal. The Savannah River Technology Center (SRTC) built a test facility to demonstrate simulated waste processing. The test facility uses a CIMCORP multi-axis robot system, a CIMROC(trademark) II robot controller, and an electric circular saw to remotely open and size reduce

plywood crates. The robot can either be teleoperated using joysticks or autonomously controlled via the CIMROC(trademark) II. Both methods are inadequate for circular saw cutting of plywood crates due to frequent saw blade binding. Blade binding results from the current commercial robot controller limitations. The limitations are overcome by incorporating additional sensor information into the existing controller structure. In this paper we utilize a force sensor and a frequency counter to implement a modified impedance controller which prevents saw blade binding. DOE

PIPE CRAWLER DEVELOPMENT FOR DUCT ELBOW REMOVAL
W. T. Zollinger and R. C. Treanor 1992 8 p Presented at the 5th Topical Meeting on Robotics and Remote Systems, Knoxville, TN, 26-29 Apr. 1993
(Contract DE-AC09-89SR-18035)
(DE93-002169; WSRC-MS-91-549; CONF-930403-2) Avail: CASI HC A02/MF A01

This paper describes the development of equipment for removing an elbow in a 36 inch diameter ventilation line by cutting from the inside. Radiation levels, high air flow and physical constraints preclude any manual rework of the ventilation system. A remotely operated pipe crawler was developed. Testing has been performed in a full-scale mockup which models the ventilation duct configuration with the exception of radiation levels. The results gathered from the testing are discussed, and illustrate the strengths and weaknesses of the crawler and plasma arc torch system. To date, the equipment has successfully completed the tasks of maneuvering through the duct geometry, performing the two required cuts, and backing out of the duct mockup. The elbow successfully fell away from the main duct, showing that the line would be clear of obstructions. DOE

OPTIMAL BOLT PRELOAD FOR DYNAMIC LOADING
T. A. Duffey 1992 17 p Presented at the Symposium on Structural Crashworthiness and Failure, Liverpool, England, 14-16 Apr. 1993
(Contract W-7405-eng-36)
(DE92-017527; LA-UR-92-1879; CONF-930418-1) Avail: CASI HC A03/MF A01

A simple spring-mass model is developed for closure bolting systems. The model takes into account the effects of bolt prestress. An analytical solution is developed for the case of an initially peaked, exponentially decaying internal pressure pulse acting on the closure. The dependence of peak bolt stresses and deflections on bolt prestress level is investigated and an optimal prestress that minimizes peak bolt stress is found in certain cases. Vulnerability curves are developed for bolted-closure systems to provide rapid evaluation of the dynamic capacity of designs for a range in bolt prestress. DOE

FRICTION MICROPROBE INVESTIGATION OF PARTICLE LAYER EFFECTS ON SLIDING FRICTION
P. J. Blau 1993 27 p Presented at the 9th International Conference of Wear of Materials, San Francisco, CA, 13-17 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE92-018868; CONF-930414-2) Avail: CASI HC A03/MF A01

Interfacial particles (third-bodies), resulting from wear or external contamination, can alter and even dominate the frictional behavior of solid-solid sliding in the absence of effective particle removal processes (e.g., lubricant flow). A unique friction microprobe, developed at Oak Ridge National Laboratory, was used to conduct fine-scale friction studies using 1.0 mm diameter stainless steel spheres sliding on several sizes of loose layers of fine aluminum oxide powders on both aluminum and alumina surfaces. Conventional pin-on-disk experiments were conducted to compare behavior with the friction microprobe results. The behavior of the relatively thick particle layers was found to be independent of the nature of underlying substrate, substantiating previous work by other investigators. The time-dependent behavior of friction, for a spherical macrocontact starting from rest, could generally be represented by a series of five rather distinct phases involving static compression, slider breakaway, transition to steady state, and dynamic layer instability. A friction model for the steady state condition, which incorporates lamellar powder layer behavior, is described. DOE

LOW-NOISE, HIGH-STRENGTH, SPIRAL-BEVEL GEARS FOR HELICOPTER TRANSMISSIONS
David G. Lewicki, Robert F. Handschuh, Zachary S. Henry (Bell Helicopter Co., Fort Worth, TX.), and Faydor L. Litvin (Chicago Univ., IL.) Jun. 1993 15 p Proposed for presentation at the 29th Joint Propulsion Conference and Exhibit, Monterey, CA, 28-30 Jun. 1993; sponsored by AIAA, SAE, ASME, and ASEE
(DA Proj. 1L1-62211-A-47-A; RTOP 505-62-10)
(NASA-TM-106080; E-7698; NAS 1.15:106080; AIAA Paper 93-2149; ARL-MR-71) Avail: CASI HC A03/MF A01

Improvements in spiral-bevel gear design were investigated to support the Army/NASA Advanced Rotorcraft Transmission program. Program objectives were to reduce weight by 25 percent, reduce noise by 10 dB, and increase life to 5000 hr mean-time-between-removal. To help meet these goals, advanced-design spiral-bevel gears were tested in an OH-58D helicopter transmission using the NASA 500-hp Helicopter Transmission Test Stand. Three different gear designs tested included: (1) the current design of the OH-58D transmission except gear material X-53 instead of AISI 9310; (2) a higher-strength design the same as the current but with a full fillet radius to reduce gear tooth bending stress (and thus, weight); and (3) a lower-noise design the same as the high-strength but with modified tooth geometry to reduce transmission error and noise. Noise, vibration, and tooth strain tests were performed and significant gear stress and noise reductions were achieved. Author

STABILITY AND STABILITY DEGREE OF A CRACKED FLEXIBLE ROTOR SUPPORTED ON JOURNAL BEARINGS
Meng Gueng (Northwestern Polytechnical Univ., Xian, China.) and Robert Gasch Jan. 1992 45 p Sponsored by Alexander von Humboldt Foundation, and DFG
(ILR-Mitt-268(1991); ETN-93-93460) Avail: CASI HC A03/MF A01

The stability and the stability degree of a flexible cracked rotor supported on different kinds of journal bearings were investigated. The influences of the crack stiffness ratio, the fixed Sommerfeld number, the gravity parameter, and the mass ratio were analyzed. It was found that the rotor crack has almost no influence on the system stability and stability degree outside the crack ridge zones; while within the crack ridge zones, the stability and stability degree depend both on the crack and system parameters. In some cases, the system may still be stable even when the crack is very

large. The influence of mass ratio on the stability degree is small and the influence of fixed Sommerfeld number on the crack stability degree is small although the Sommerfeld number has a large influence on the stability degree of uncracked rotor. ESA

The present invention relates to an adjustable linkage assembly for selectively retaining the position of one member pivotable with respect to another member. More specifically, the invention relates to a linkage assembly commonly referred to as a gimbal joint, and particularly to a quick release or quick acting gimbal joint. The assembly is relatively simple in construction, compact in size, and has superior locking strength in any selected position. The device can be quickly and easily actuated, without separate tooling, by inexperienced personnel or by computer controlled equipment. It also is designed to prevent inadvertent actuation.

Int-Patent-Class-B25J-3/00) Avail: US Patent and Trademark Office

A universal input device for interfacing a human operator with a slave machine such as a robot or the like includes a plurality of serially connected mechanical links extending from a base. A handgrip is connected to the mechanical links distal from the base such that a human operator may grasp the handgrip and control the position thereof relative to the base through the mechanical links. A plurality of rotary joints is arranged to connect the mechanical links together to provide at least three translational degrees of freedom and at least three rotational degrees of freedom of motion of the handgrip relative to the base. A cable and pulley assembly for each joint is connected to a corresponding motor for transmitting forces from the slave machine to the handgrip to provide kinesthetic feedback to the operator and for producing control signals that may be transmitted from the handgrip to the slave machine. The device gives excellent kinesthetic feedback, high-fidelity force/torque feedback, a kinematically simple structure, mechanically decoupled motion in all six degrees of freedom, and zero backlash. The device also has a much larger work envelope, greater stiffness and responsiveness, smaller stowage volume, and better overlap of the human operator's range of motion than previous designs. PLANETARY GEAR TRAIN RING GEAR AND SUPPORT STRUCTURE INVESTIGATION Ph.D. Thesis

Mark J. Valco 1992 357 p
Avail: Univ. Microfilms Order No. DA9237171

Most helicopter transmissions utilize a planetary gear train as the final speed reduction stage. Due to weight constraints these transmissions have high power-to-weight ratios and relatively flexible structures. This investigation addresses the analysis of planetary gear trains with the ring gear mounted on a flexible support structure. The approach utilizes recent advances in automated contact methods for nonlinear finite element analysis. Rather than using a line of action spring to model gear pair mesh stiffness, finite element models of complete gears are developed, and the elastic gear members are engaged and rolled through mesh. The procedure includes detailed gear tooth geometry with profile modifications. A nonlinear approach is required due to large displacements associated with gear rotation and nonlinear boundary conditions associated with the gear tooth surface contact. The updated Lagrangian formulation and the MARC K-4.1 automated contact features are applied in the analysis. The ring gear support structure is modeled by an elastic foundation linking the ring gear to a rigid support. Calculation of gear pair deflections, stresses, transmission error, and mesh stiffness through the gear meshing cycle are demonstrated for external and internal spur gear pairs and a planetary gear train. Issues relating to the accuracy of the nonlinear finite element contact method, gear mesh stiffness, transmission error, and the planetary gear train elastic support structure are discussed. Dissert. Abstr.

CONTROL AND ANALYSIS OF A SINGLE-LINK FLEXIBLE BEAM WITH EXPERIMENTAL VERIFICATION

J. F. Jansen Dec. 1992 22 p
(Contract DE-AC05-84OR-21400)
(DE93-003756; ORNL/TM-12198) Avail: CASI HC A03/MF A01

The objective of this report is to ascertain the general conditions for the avoidance and reduction of residual vibration in a flexible manipulator. Conventional manipulators usually have a 1.5 to 2-m reach, and their associated dynamic models typically are composed of lumped parameter elements; the major compliance emanates from the drive trains because of torsional loading effects. The energy storage of the drive system is predominantly potential energy because of the low inertia in the drive train; thus simple spring models have been adequate. A long-reach manipulator with a large aspect ratio (length to diameter) is a fundamentally different problem. Energy storage for this type of manipulator is distributive by nature because of the potential energy resulting from bending and the kinetic energy due to deflection rates. Instead of ordinary differential equations, partial differential equations are required to describe this system, making the analysis more difficult. The general flexibility problem associated with a distributive dynamic system, with specific emphasis on flexible manipulator, will be addressed in this report. Furthermore, three control schemes will be discussed and demonstrated on a single flexible manipulator to determine their general merits. DOE

PATCH TESTING OF CERAMIC BARRIER FILTERS
D. H. Pontius and P. VannBush 1992 6 p Presented at the US DOE Contractors Review Meeting on Coal-Fueled Heat Engines, Advanced PFBC and Gas Stream Cleanup Systems, Morgantown, WV, 27-28 Oct. 1992
(Contract DE-AC21-89MC-26239)
(DE93-005017; DOE/MC-26239/93/C0155; CONF-921034-15) Avail: CASI HC A02/MF A01

The objectives of this work are to construct, install and operate a patch testing unit on a hot gas stream at a coal-fired fluidized-bed boiler. Long-term 'patch tests' will be conducted on ceramic disks of the same materials used in the fabrication of ceramic candles and ceramic crossflow filters. The primary issues to be addressed in these tests are the long-term physical, thermal and chemical stability of the ceramic materials; long-term pressure drop and filtration characteristics of the ceramic filters; potential for irreversible clogging of filter elements; and long-term performance and reliability of auxiliary hardware, such as the tube require about 3 to 4 months of nearly continuous operation. Progress is discussed. DOE

HIGH TEMPERATURE FILTER MATERIALS
M. A. Alvin, T. E. Lippert, D. M. Bachovchin, and R. E. Tressler (Pittsburgh State Univ., KS.) 1992 22 p Presented at the US DOE Contractors Review Meeting on Coal-Fueled Heat Engines, Advanced PFBC and Gas Stream Cleanup Systems, Morgantown, WV, 27-28 Oct. 1992
(Contract DE-AC21-88MC-25034)
(DE93-005018; DOE/MC-25034/93/C0157; CONF-921034-16) Avail: CASI HC A03/MF A01

Objectives of this program are to identify the potential long-term thermal/chemical effects that advanced coal-based power generating system environments have on the stability of porous ceramic filter materials, as well as to assess the influence of these effects on filter operating performance and life. We have principally focused our efforts on developing an understanding of the stability of the alumina/mullite filter material at high temperature (i.e., 870, 980, and 1100 C) under oxidizing conditions which contain gas phase alkali species. Testing has typically been performed in two continuous flow-through, high temperature test facilities at the Westinghouse Science and Technology Center, using 7 cm diameter times 6.4 mm thick discs. (Alvin, 1992) Each disc of ceramic filter material is exposed for periods of 100 to 3,000 hours in duration. Additional efforts have been performed at Westinghouse to broaden our understanding of the stability of cordierite, cordierite-silicon nitride, reaction and sintered silicon nitride, and clay bonded silicon carbide under similar simulated advanced coal fired process conditions. The results of these efforts are presented in this paper. DOE

HIGH-PRESSURE CERAMIC AIR HEATER FOR INDIRECTLY FIRED GAS TURBINE APPLICATIONS
P. G. LaHaye, G. F. Briggs, C. L. Vandervort, and J. L. Seger 1992 10 p Presented at the US DOE Contractors Review Meeting on Coal-Fueled Heat Engines, Advanced PFBC and Gas Stream Cleanup Systems, Morgantown, WV, 27-28 Oct. 1992
(Contract DE-FC21-90MC-26008)
(DE93-005022; DOE/MC-26008/93/C0149; CONF-921034-20) Avail: CASI HC A02/MF A01

The Externally-Fired Combined Cycle (EFCC) offers a method for operating high-efficiency gas and steam turbine combined cycles on coal. In the EFCC, an air heater replaces the gas turbine combustor so that the turbine can be indirectly fired. Ceramic materials are required for the heat exchange surfaces to accommodate the operating temperatures of modern gas turbines. The ceramic air heater or heat exchanger is the focus of this program, and the two primary objectives are (1) to demonstrate that a ceramic air heater can be reliably pressurized to a level of 225 psia (1.5 MPa); and (2) to show that the air heater can withstand exposure to the products of coal combustion at elevated temperatures. By replacing the gas turbine combustor with a ceramic air heater, the cycle can use coal or other ash-bearing fuels. Numerous programs have attempted to fuel high efficiency gas turbines directly with coal, often resulting in significant ash deposition upon turbine components and corrosion or erosion of turbine blades. This report will show that a ceramic air heater is significantly less susceptible to ash deposition or corrosion than a gas turbine when protected by rudimentary methods of gas-stream clean-up. A 25 x 10(sup 6) Btu/hr (7 MW) test facility is under construction in Kennebunk, Maine. It is anticipated that this proof of concept program will lead to commercialization of the EFCC by electric utility and industrial organizations. Applications are being pursued for power plants ranging from 10 to 100 megawatts. DOE

HEAVY DUTY GAS TURBINE COMBUSTION TESTS WITH SIMULATED LOW BTU COAL GAS
T. E. Ekstrom, R. A. Battista, and G. P. Maxwell 1992 10 p Presented at the US DOE Contractors Review Meeting on Coal-Fueled Heat Engines, Advanced PFBC and Gas Stream Cleanup Systems, Morgantown, WV, 27-28 Oct. 1992
(Contract DE-FC21-91MC-27221)
(DE93-005078; DOE/MC-27221/93/C0153; CONF-921034-22) Avail: CASI HC A02/MF A01

There is an increasing industry interest in integrated gas turbine combined cycle plants in which coal gasifiers provide the fuel for the gas turbines. Some gasifier plant designs, including the air-blown processes, some integrated oxygen blown processes and some oxygen-blown processes followed by heavy moisturization, produce fuel gases which have lower heating values ranging from 130 to below 100 BTU/scf for which there is little gas turbine combustion experience. This program has the objectives to: Parametrically determine the effects of moisture, nitrogen and carbon dioxide as diluents so that the combustion characteristics of many varieties of gasification product gases can be reasonably predicted without physically testing each specific gas composition; determine emissions characteristics including NO(x), CO, levels etc. associated with each of the diluents; operate with two syngas compositions; DOE chosen air-blown and integrated oxygen-blown, to confirm that the combustion characteristics are in line with predictions; determine if 'logical' refinements to the fuel nozzle will yield improved performance for LBTU fuels; determine the conversion rate of ammonia to NO(x); determine the effects of methane inclusion in the fuel. DOE

DEVELOPMENT OF THE NESTED FIBER FILTER
R. D. Litt, H. N. Conkle, and J. K. Raghavan 1992 6 p Presented at the US DOE Contractors Review Meeting on Coal-Fueled Heat Engines, Advanced PFBC and Gas Stream Cleanup Systems, Morgantown, WV, 27-28 Oct. 1992
(Contract DE-AC21-89MC-26233)
(DE93-005015; DOE/MC-26233/93/C0167; CONF-921034-13) Avail: CASI HC A02/MF A01

Battelle has tested the Nested Fiber Filter (NFF) as a particulate control device for high temperature, high-pressure (HTHP) applications. Battelle funded initial bench-scale tests which were the basis for patents and a concept applying the NFF. Subsequent parametric tests in a 6-inch diameter reactor established excellent particulate capture performance, greater than 99 percent, for conditions up to 1600 F and 6 atmospheres. Effective cleaning/regeneration of the NFF was achieved in the 6-inch scale with acoustic and mechanical vibration. A pulse combustor was tested in an integrated NFF arrangement because of compatibility with the HTBP conditions. This arrangement provided the basis for larger scale tests under the subject contract. A 6-sq ft test module was designed and installed with an existing fluidized bed combustor for additional development and testing. DOE

DEVELOPMENT OF TEST PROCEDURES FOR HYBRID/ELECTRIC VEHICLES
A. F. Burke Jul. 1992 75 p Revised
(Contract DE-AC07-76ID-01570)
(DE93-005179; DOE/ID-10385; INEL/MISC-92055) Avail: CASI HC A04/MF A01

The development of procedures for testing of hybrid/electric vehicles to determine their energy consumption and emissions characteristics is addressed. Special emphasis is given to hybrid vehicles, which can be operated above some minimum battery state-of-charge in an all-electric mode for all types of driving (city and highway). When the all-electric range of these vehicles is exceeded, the vehicles are operated in the hybrid mode, in which an engine/generator is turned on to generate electricity on-board the vehicle. Key issues in testing hybrid vehicles are identified and discussed. These issues include the test cycles to be used, the instrumentation required, the effect of battery state-of-charge and control strategy in the hybrid mode on the need for repeated test cycles, and the data to be collected and how that data from repeated cycles is interpreted to determine the vehicle energy consumption and emissions characteristics. DOE

SEMI-ACTIVE SUSPENSION FOR AUTOMOTIVE APPLICATION
Paul J. T. Venhovens and Alex R. deVlugt (Volvo Car B.V., Helmond, Netherlands.) 1991 31 p Presented at International Conference of Automobile Engineeering Students and Young Automobile Engineers, Prague, Czechoslovakia, 10-14 Sep. 1991
(MEMT-17; ISBN-90-370-0059-2; ETN-93-92010) Copyright Avail: CASI HC A03/MF A01

The theoretical considerations for semi-active damping system evaluation, with respect to semi-active suspension and Kalman filtering, are discussed in terms of the software. Some prototype hardware developments are proposed. A significant improvement in ride comfort performance can be obtained, indicated by root mean square body acceleration values and frequency responses, using a switchable damper system with two settings. Nevertheless the improvement is accompanied by an increase in dynamic tire load variations. The main benefit of semi-active suspensions is the potential of changing the low frequency section of the transfer function. In practice this will support the impression of extra driving stability. It is advisable to apply an adaptive control strategy like the (extended) skyhook version switching more to the 'comfort' setting for straight (and smooth/moderate roughness) road running and switching to 'road holding' for handling maneuvers and possibly rough roads and discrete, severe events like potholes. CONDITION BASED MACHINERY MAINTENANCE (HELICOPTER FAULT DETECTION), PHASE 1 Final Report
T. W. Brotherton and T. G. Pollard 29 Jan. 1993 42 p LIMITED REPRODUCIBILITY: Availability: Document partially illegible
(Contract N00014-92-C-0059)
(AD-A259774) Avail: CASI HC A03/MF A01

A problem of current interest to the Navy is the automatic detection and classification of faults in mechanical systems such as the transmissions, gearboxes, and bearings of helicopters. The problem is important for both economic and safety reasons. Using automated fault detection and classification, machinery repair can be undertaken as needed and can prevent catastrophic failure. This condition-based maintenance approach is more efficient and cost-effective than the use of predetermined maintenance schedules. Additionally, automated fault detection and classification systems can alert machinery operators, such as helicopter pilots, of the onset of a mechanical problem, thus allowing the pilot to take precautions, such as landing the aircraft, before a potentially catastrophic failure occurs. IMAGING TECHNIQUE FOR WELDING STUDIES
A. R. Pomplun Nov. 1992 22 p
(Contract DE-AC04-76DR-00789)
(DE93-006449; SAND-93-8205) Avail: CASI HC A03/MF A01

The application of standard imaging techniques for arc welding processes does not provide the data required to construct and verify welding models. The intense luminance range of the arc exceeds the dynamic response of film emulsions and electronic sensors. A diagnostic imaging technique which uses laser illumination and narrow band pass filters in conjunction with high speed film and video systems provides detailed experimental data for welding process modeling. PATTERN CLASSIFIER FOR HEALTH MONITORING OF HELICOPTER GEARBOXES
Hsinyung Chin (Massachusetts Univ., Amherst.), Kourosh Danai (Massachusetts Univ., Amherst.), and David G. Lewicki Apr. 1993 15 p Proposed for presentation at the 47th Meeting of the Mechanical Failures Prevention Group, Virginia Beach, VA, 13-15 Apr. 1993; sponsored by ONR
(RTOP 505-62-10; DA Proj. 1L1-62211-A-47-A)
(NASA-TM-106099; E-7741; NAS 1.15:106099; AVSCOM-TR-92-C-033)
Avail: CASI HC A03/MF A01

The application of a newly developed diagnostic method to a helicopter gearbox is demonstrated. This method is a pattern classifier which uses a multi-valued influence matrix (MVIM) as its diagnostic model. The method benefits from a fast learning algorithm, based on error feedback, that enables it to estimate gearbox health from a small set of measurement-fault data. The MVIM method can also assess the diagnosability of the system and variability of the fault signatures as the basis to improve fault signatures. This method was tested on vibration signals reflecting various faults in an OH-58A main rotor transmission gearbox. The vibration signals were then digitized and processed by a vibration signal analyzer to enhance and extract various features of the vibration data. The parameters obtained from this analyzer were utilized to train and test the performance of the MVIM method in both detection and diagnosis. The results indicate that the MVIM method provided excellent detection results when the full range of faults effects on the measurements were included in training, and it had a correct diagnostic rate of 95 percent when the faults were included in training. END EFFECTORS AND GRAPPLE FIXTURES Patent
Ron Vandersluis, inventor (to National Research Council of Canada and Erik Quittner, inventor (to National Research Council of Canada 28 Jan. 1992 44 p Filed 28 Sep. 1987
(CA-Patent-1-294-917; Int-Patent-Class-B25J-19/00; Int-Patent-Class-B64G-1/64; CTN-93-60634) Copyright Avail: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada HC

An end effector has been developed for use with a space station remote manipulator system where capture and release capabilities are required, and which will provide for the transfer of substantial loads together with electrical power and signals across the end effector grapple fixture interface. The end effector has a latching mechanism for the transfer of substantial loads across the end effector grapple fixture interface. The functions associated with known nonlatching end effectors, namely their snaring and rigidizing capabilities, are maintained and can be operated

independently of the new latching mechanisms and umbilical connectors of the end effector. The end effector is capable of functioning equally as a wrist (manipulator) and shoulder (arm base) unit. Applications of the new end effector include space station assembly, payload handling, capture of free-flyers, payload servicing, and providing stable bases for extravehicular activity work stations or robotic devices. GRAPPLE FIXTURE Patent
Ron Vandersluis, inventor (to National Research Council of Canada and Erik Quittner, inventor (to National Research Council of Canada 17 Mar. 1992 42 p Filed 23 Mar. 1990
(CA-Patent-1-297-519; Int-Patent-Class-B25J-19/00; Int-Patent-Class-B64G-1/64; CTN-93-60670) Copyright Avail: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada HC

A grapple fixture is disclosed which is capable of use in a space station assembly, payload handling functions, capture of free flyers, assisting in payload servicing, and providing a stable base for extravehicular activity work stations or robotic devices. In particular, the grapple fixture of the invention may be located on a mobile servicing center, a maintenance depot or any other space station installation. The fixture is also able to support the space station remote manipulator system. The fixture comprises a base consisting of a mounting flange with an outwardly extending cylindrical body having an outer annular end effector abutment face; an end effector latching trunnion attached to the cylindrical body of the base; a cone-shaped aligning body extending outwardly from the cylindrical body; and a fixture recess engaging shoulder extending around part of the cylindrical base and secured against relative movement to the abutment face.

TAGUCHI METHODS APPLIED TO OXYGEN-ENRICHED DIESEL ENGINE EXPERIMENTS
W. W. Marr, R. R. Sekar, R. L. Cole, T. J. Marciniak, and D. E. Longman (AutoResearch Labs., Inc., Chicago, IL.) 1992 5 p Presented at the 16th Annual Energy-sources Technology Conference and Exhibition, Houston, TX, 25 Jan. - 4 Feb. 1993
(Contract W-31-109-eng-38)
(DE93-004873; ANL/CP-77378; CONF-930124-2) Avail: CASI HC A01/MF A01

This paper describes a test series conducted on a six-cylinder diesel engine to study the impacts of controlled factors (i.e., oxygen content of the combustion air, water content of the fuel, fuel rate, and fuel-injection timing) on engine emissions using Taguchi methods. Three levels of each factor were used in the tests. Only the main effects of the factors were examined; no attempt was made to analyze the interactions among the factors. It was found that, as in the case of the single-cylinder engine tests, oxygen in the combustion air was very effective in reducing particulate and smoke emissions. Increases in NO(sub x) due to the oxygen enrichment observed in the single-cylinder tests also occurred in the present six-cylinder tests. Water in the emulsified fuel was found to be much less effective in decreasing NO(sub x) emissions for the six-cylinder engine than it was for the single-cylinder engine. DOE

ASSESSMENT OF FUTURE NATURAL GAS VEHICLE CONCEPTS Final Report, Oct. 1991 - Jul. 1992
B. Groten and S. Arrigotti Oct. 1992 70 p Sponsored by Gas Research Inst., Chicago, IL
(Contract GRI-5091-260-2201)
(PB93-138923; Rept-9188R365; GRI-92/0433) Avail: CASI HC A04/MF A01

The development of Natural Gas Vehicles is progressing rapidly under the stimulus of recent vehicle emission regulations. The development is following what can be viewed as a three step progression. In the first step, contemporary gasoline or diesel fueled automobiles are retrofitted with equipment enabling the vehicle to operate on either natural gas or standard liquid fuels. The second step is the development of vehicles which utilize traditional internal combustion engines that have been modified to operate exclusively on natural gas. These dedicated natural gas vehicles operate more efficiently and have lower emissions than the dual fueled vehicles. The third step is the redesigning, from the ground up, of a vehicle aimed at exploiting the advantages of natural gas as an automotive fuel while minimizing its disadvantages. The current report is aimed at identifying the R&D needs in various fuel storage and engine combinations which have potential for providing increased efficiency, reduced emissions, and reductions in vehicle weight and size. Fuel suppliers, automobile and engine manufacturers, many segments of the natural gas and other industries, and regulatory authorities will influence or be affected by the development of such a third generation vehicle, and it is recommended that GRI act to bring these groups together in the near future to begin, developing the focus on a 'designed-for-natural-gas' vehicle. UNDERSTANDING AND MODELING THE BEHAVIOR OF A HARMONIC DRIVE GEAR TRANSMISSION
Timothy D. Tuttle May 1992 317 p
(Contract N00014-86-K-0685)
(AD-A259610; AI-TR-1365) Avail: CASI HC A14/MF A03

As harmonic-drive transmissions find increased use and acceptance among engineers and designers, the demand for an accurate and reliable understanding of harmonic-drive operating behavior becomes great. I performed an extensive experimental investigation of harmonic-drive properties such as stiffness, friction, and kinematic error. From my experimental results, I have confirmed that kinematic error appears primarily at frequencies that are multiples of the wave-generator rotational speed and that transmission stiffness can be highly non-linear. Additionally, measurements of static and dynamic friction demonstrated that energy dissipation in harmonic drives varies non-linearly with velocity and periodically with rotation and can escalate during system resonance. Due to the interaction of these transmission properties, dynamic response measurements showed surprisingly agitated behavior, especially around system resonance. This behavior was rationalized in terms of the observed

properties and used to develop dynamic models to describe harmonic-drive operation. From these models, I realized that non-linear frictional effects cannot be ignored in any accurate representation. Additionally, if behavior around system resonance must be replicated, both kinematic error and compliant behavior are essential. GRA

MODELING AND CONTROL OF FLEXIBLE MANIPULATORS Ph.D. Thesis
Zhijie Xia 1992 216 p
Avail: Univ. Microfilms Order No. DA9238302

The modeling and control of flexible manipulators are investigated. It contributes to three areas: (1) the tracking control of nonminimum phase systems; (2) modeling and control of flexible one-link manipulators; and (3) modeling and control of flexible multi-link manipulators. The characteristics of the discrete-time nonminimum phase zeros are first analyzed, and a precision tracking control method for nonminimum phase systems is proposed. The proposed precision tracking controller cancels all the phase shift of the nonminimum phase zeros and minimizes their gain errors within the concerned frequency range. The second part of the research is the modeling and control of flexible one-link manipulators. A reduced order finite element model is presented, and the system transfer functions are constructed. A real time end-point tracking control scheme is developed by applying the proposed precision tracking control method. A payload adaptation algorithm is proposed to identify the payload variation, and an adaptive tracking control algorithm is formulated. Based on the understanding from the study of flexible one-link manipulators, the modeling and control of flexible multi-link manipulators are investigated. An accurate system model, which includes the mutual dependence of the rigid and the elastic motion as well as the effects of the elastic deformation on the transformation matrix, is proposed for general planar flexible manipulators. To reduce the amount of computations in the dynamic analysis, a model reduction technique is developed, in which the dominant modes of the system as well as the time variant nature of the mode shape functions remain. Consequently, the required computation for dynamic analysis is greatly reduced while the accuracy of the system response is maintained. The end-point tracking control of a flexible manipulator is also investigated. A time-varying estimator is designed to estimate the system elastic deformation. Using the desired end-point motion and the estimated system elastic motion, a tracking control scheme, which consists of a feedback controller, a command feedforward controller, and an elastic motion estimator, is proposed. The proposed tracking control algorithm is very efficient and can be implemented for real time control. Dissert. Abstr.

TRAJECTORY CONTROL OF AN ARTICULATED ROBOT WITH A PARALLEL DRIVE ARM BASED ON SPLINES UNDER TENSION Ph.D. Thesis
Seung-Jong Yi 1992 204 p
Avail: Univ. Microfilms Order No. DA9238369

Today's industrial robots controlled by mini/micro computers are basically simple positioning devices. The positioning accuracy depends on the mathematical description of the robot configuration to place the end-effector at the desired position and orientation within the workspace and on following the specified path which requires the trajectory planner. In addition, the consideration of joint velocity, acceleration, and jerk trajectories are essential for trajectory planning of industrial robots to obtain smooth operation. The newly designed 6 DOF articulated robot with a parallel drive arm mechanism which permits the joint actuators to be placed in the same horizontal line to reduce the arm inertia and to increase load capacity and stiffness is selected. First, the forward kinematic and inverse kinematic problems are examined. The forward kinematic equations are successfully derived based on Denavit-Hartenberg notation with independent joint angle constraints. The inverse kinematic problems are solved using the arm-wrist partitioned approach with independent joint angle constraints. Three types of curve fitting methods used in trajectory planning, i.e., certain degree polynomial functions, cubic spline functions, and cubic spline functions under tension, are compared to select the best possible method to satisfy both smooth joint trajectories and positioning accuracy for a robot trajectory planner. Cubic spline functions under tension is the method selected for the new trajectory planner. This method is implemented for a 6 DOF articulated robot with a parallel drive arm mechanism to improve the smoothness of the joint trajectories and the positioning accuracy of the manipulator. Also, this approach is compared with existing trajectory planners, 4-3-4 polynomials and cubic spline functions, via circular arc motion simulations. The new trajectory planner using cubic spline functions under tension is implemented into the microprocessor based robot controller and motors to produce combined arc and straight-line motion. The simulation and experiment show interesting results by demonstrating smooth motion in both acceleration and jerk and significant improvements of positioning accuracy in trajectory planning. KINEMATICS AND DYNAMICS OF ROBOTIC SYSTEMS WITH MULTIPLE CLOSED LOOPS Ph.D. Thesis
Chang-De Zhang 1992 328 p
Avail: Univ. Microfilms Order No. DA9238371

The kinematics and dynamics of robotic systems with multiple closed loops, such as Stewart platforms, walking machines, and hybrid manipulators, are studied. In the study of kinematics, focus is on the closed-form solutions of the forward position analysis of different parallel systems. A closed-form solution means that the solution is expressed as a polynomial in one variable. If the order of the polynomial is less than or equal to four, the solution has analytical closed-form. First, the conditions of obtaining analytical closed-form solutions are studied. For a Stewart platform, the condition is found to be that one rotational degree of freedom of the output link is decoupled from the other five. Based on this condition, a class of Stewart platforms which has analytical closed-form solution is formulated. Conditions of analytical closed-form solution for other parallel systems are also studied. Closed-form solutions of forward kinematics for walking machines and multi-fingered grippers are then studied. For a parallel system with three three-degree-of-freedom subchains, there are 84 possible ways to select six independent joints among nine joints. These 84 ways can be classified into three categories: Category 3:3:0, Category 3:2:1, and Category 2:2:2. It is shown that the first category has no solutions; the solutions of the second category have analytical closed-form; and the solutions of the last category are higher order polynomials. The study is then extended to a nearly general Stewart platform. The solution is a 20th order polynomial and the Stewart platform has a maximum of 40 possible configurations. Also, the study is extended to a new class of hybrid manipulators which consists of two serially connected parallel mechanisms. In the study of dynamics, a computationally efficient method for inverse dynamics of manipulators based on the virtual work principle is developed. Although this method is comparable with the recursive Newton-Euler method for serial manipulators, its advantage is more noteworthy when applied to parallel systems. An approach of inverse dynamics of a walking machine is also developed, which includes inverse dynamic modeling, foot force distribution, and joint force/torque allocation. A new approach is then proposed to determine the foot distribution of planar walking gaits based on two optimum criteria. A computational scheme is then developed to determine the joint force/torque allocation, on the basis of the virtual work principle. As an illustration, the inverse dynamic modeling of a quadruped with pantograph legs is derived. The inverse dynamics of this quadruped walking in different wave gaits is then studied. Dissert. Abstr.

WRENCH FOR INSTALLING AN ELECTRICAL CONNECTOR Patent Application
Norman F. Willett, inventor (to Navy) 26 Oct. 1992 22 p
(AD-D015625; US-Patent-Appl-SN-966478; Navy-Case-74663) Avail: CASI HC A03/MF A01

A wrench for installing or removing an electrical connector having a collar is provided. The wrench comprises two handles, an elongated sleeve, a shaft, a cam, and a grip. One end of the elongated sleeve slidably attaches to a hub of the grip while the other end slidably attaches to the first handle. The grip further comprises a semicircular-shaped claw which engages the collar of the electrical connector. The shaft is rotatably disposed within the interior of the sleeve. One end of the shaft is eccentrically connected to the cam and the other end is connected to the second handle. The second handle is positioned within an aperture of the first handle. During operation of the wrench, the user grasps both handles and maneuvers the wrench between a series of cables on one side of an electric terminal assembly having a plurality of interconnected cables until

the grip is positioned over the collar of a connector of a selected electrical cable. The second handle is then rotated for the purpose of gripping the collar between the claw and the cam. GRA

A COMPARATIVE ANALYSIS OF ALTERNATIVE FUELS FOR THE INEL VEHICLE FLEET
S. Priebe, W. Boyer, and K. Church Nov. 1992 56 p
(Contract DE-AC07-76ID-01570)
(DE93-007224; EGG-EP-10500) Avail: CASI HC A04/MF A01

This report summarizes the results of a comparative systems analysis of various alternative fuels for use in the buses, mid-size vehicles, and automobiles that make up the vehicle fleet at the Idaho National Engineering Laboratory (INEL). The study was performed as part of the Laboratory Directed Research and Development (LDRD) Program for EG&G Idaho, Inc. Regulations will require the INEL to reduce total gasoline and diesel fuel use 10 percent by 1995 compared with 1991 levels, and will require that 50 percent of all new vehicles be fueled by some type of alternative fuel by 1998. A model was developed to analyze how these goals could be achieved, and what the cost would be to implement the goals. DOE

The Institute of Mechanical Engineering (IME) is part of Canada's National Research Council. Its mission is to undertake, support, promote, and disseminate research and development in the mechanical engineering aspects of three vital sectors of the Canadian economy: transportation, resource industries, and manufacturing. The IME achieves its mission by performing research and development in its own facilities; by developing, providing, and transferring expertise and knowledge; by making its research facilities available to collaborators and clients; and by participating in international liaison and collaborative research activities. Six research programs are conducted in the IME: Advanced Manufacturing Technology; Coastal Zone Engineering; Cold Regions Engineering; Combustion and Fluids Engineering; Ground Transportation Technology; and Machinery and Engine Technology. The rationale and major research thrusts of each program are described, and specific achievements in 1991-92 are reviewed. Lists of technical reports and papers presented by IME personnel are also included. CISTI

Work in the second year of a project devoted to the development of new asperity-based models of frictional interfaces is summarized. The main concept is to combine statistical homogenization methods with a realistic nonlinear finite element analysis of surface asperities, and thus produce new asperity-based models of contact and friction. The research in the first year of the project provided a complete theory and software for statistical homogenization of random surface parameters. In the second year of the project, the effort focused on the development of a finite element code for modeling of nonelastic surface asperities, as well as on the design and performance of the verification experiment. The asperity modeling code is based on an hp adaptive finite element kernel, with object-based data structure, error estimation, and graphic user interface. The code is capable of modeling elastic and elasto-viscoplastic solids in contact with a rigid flat. In parallel with the code development, an experiment was designed and performed for custom-made asperities in contact with rigid surfaces. The results of these experiments compare favorably with numerical predictions of the finite element method. Finally, the results of the finite element analysis were used to construct the first asperity-based contact model of random surface. GRA

ELECTRIC AND HYBRID VEHICLE PROGRAM; SITE OPERATOR PROGRAM
J. F. Warren May 1992 62 p
(Contract DE-AC07-76ID-01570)
(DE93-005239; EGG-EP-10295) Avail: CASI HC A04/MF A01

Activities during the second quarter included the second meeting of the Site Operators in Phoenix, AZ in late April. The meeting was held in conjunction with the Solar and Electric 500 Race activities. Delivery of vehicles ordered previously has begun, although two of the operators are experiencing some delays in receiving their vehicles. Public demonstration activities continue, with an apparent increasing level of awareness and interest being displayed by the public. Initial problems with the Site Operator Database have been corrected and revised copies of the program have been supplied to the program participants. Operating and Maintenance data is being supplied and submitted to INEL on a monthly basis. Interest in the Site Operator Program is being reflected in requests for information from several organizations from across the country, representing a wide diversity of interests. These organizations have been referred to existing Site Operators with the explanation that the program will not be adding new participants, but that most of the existing organizations are willing to work with other groups. The exception to this was the addition of Potomac Electric Power Company (PEPCO) to the program. PEPCO has been awarded a subcontract to operate and maintain the DOE owned G-Van and Escort located in Washington, DC. They will provide data on these vehicles, as well as a Solectria Force which PEPCO has purchased. The Task Force intends to be actively involved in the infrastructure development in a wide range of areas. These include, among others, personnel development, safety, charging, and servicing. Work continues in these areas. York Technical College (YORK) has completed the draft outline for the EV Technician course. This is being circulated to organizations around the country for comments. Kansas State University (KSU) is working with a private sector company to develop a energy dispensing meter for opportunity charging in public areas. DOE

ANL'S ELECTRIC VEHICLE BATTERY ACTIVITIES FOR USABC
1992 17 p Prepared in cooperation with United States Advanced Battery Consortium
(Contract W-31-109-eng-38)
(DE93-005691; ANL/CMT/RP-78324) Avail: CASI HC A03/MF A01

The Electrochemical Technology Program at Argonne National Laboratory (ANL) provides advanced battery R&D; technology transfer to industry; technical analyses, assessments, modeling, and databases; and independent testing and post-test analyses of advanced batteries. These capabilities and services are being offered to the US Advanced Battery Consortium (USABC) and Cooperative Research and Development Agreements (CRADA) are being negotiated for USABC-sponsored work at ANL. A small portion of DOE's cost share for USABC projects has been provided to ANL to continue R&D and testing activities on key technologies that were previously supported directly by DOE. This report summarizes progress on these USABC projects during the period of April 1 through September 30, 1992. In this report, the objective, background, technical progress, and status are described for each task. The work is organized into the following task areas: 1.0 Lithium/Sulfide Batteries; 2.0 Nickel/Metal Hydride Support 3.0 EV Battery Performance; and Life Evaluation. DOE

ADVANCED POWER CONDITIONING FOR MAGLEV SYSTEMS Final Report
A. Nerem, E. E. Bowles, S. Chapelle, and R. J. Callanan Aug. 1992 361 p Sponsored by Federal Railroad Administration
(Contract DTFR53-91-C-00081)
(PB93-150274; GA-A20986; DOT/FRA/NMI-92/14) Avail: CASI HC A16/MF A03

The final report contains parametric scaling data and computer models of power conditioning equipment applicable to the design of an advanced maglev system. The power conditioning topologies were selected based on data from a literature search, on characteristics of present power semiconductor technology devices, and on actual performance characterization of designs using a circuit analysis program. The analyses show that GTO's are the best switches for traction drives, input power conditioning equipment, and the braking chopper. At lower power levels, as required for auxiliary power and superconducting coil power conditioning, the IGBT appeared to be the best switch. GRA

EXPERIMENTAL AND ANALYTICAL STUDY OF A HYBRID ISOLATION SYSTEM USING FRICTION CONTROLLABLE SLIDING BEARINGS
M. Q. Feng, M. Shinozuka, and S. Fujii 15 May 1992 101 p Sponsored by NSF Prepared in cooperation with Princeton Univ., NJ, and Taisei Corp., Tokyo
(Contract NSF BCS-90-25010; NEC-91029)
(PB93-150282; NCEER-92-0009) Avail: CASI HC A06/MF A02

A hybrid sliding isolation system (HBIS) using friction controllable sliding bearings is studied. The system controls the friction force on the sliding interface between the supported structure and the ground, by adjusting the pressure in a bearing chamber, to confine the sliding displacement within an acceptable range, while keeping the transfer of seismic force to a minimum. Instantaneous optimal control and bang-bang control algorithms are developed for controlling the friction force. The effectiveness of the algorithms is demonstrated by shaking table experiments and computer simulation. An HBIS using friction controllable bearings is fabricated and shaking table experiments are performed using a rigid structural model equipped with such a hybrid system. The dynamic characteristics of the control system for bearing pressure and sliding friction are identified, and the advantage of the HBIS over the passive system is demonstrated by experiments. Computer codes for simulation of structural response under passive or hybrid control are developed. The numerically simulated results show good agreement with the experimental results, verifying that the analytical model developed represents the actual system very well. GRA

EVALUATION OF AN EMITEC RESISTIVELY HEATED METAL MONOLITH CATALYTIC CONVERTER ON TWO M100 NEAT METHANOL-FUELED VEHICLES
Gregory K. Piotrowski and Ronald M. Schaefer Dec. 1992 31 p
(PB93-141059; EPA/AA/CTAB-92/04) Avail: CASI HC A03/MF A01

The report describes the evaluation of a resistively heated catalyst system on two different methanol fueled vehicles. The EMITEC catalyst consisted of a compact resistively heated metal monolith in front of a larger conventional main converter. The EMITEC catalyst was evaluated on two neat methanol-fueled vehicles, a 1981 Volkswagen Rabbit and a 1988 Toyota Corolla. Emission testing was conducted over the Federal Test Procedure (FTP) CVS-75 test cycle. The emissions of primary interest were cold start methanol (unburned fuel), carbon monoxide, and formaldehyde. A GLOBAL PATH PLANNING APPROACH FOR REDUNDANT MANIPULATORS
Sanjeev Seereeram and J. Wen Jan. 1993 59 p
(Grant NAGw-1333)
(NASA-CR-193017; NAS 1.26:193017; RPI-CIRSSE-127) Avail: CASI HC A04/MF A01

A new approach for global path planning of redundant manipulators is proposed. It poses the path planning problem as a finite time nonlinear control problem. The solution is found by a Newton-Raphson type algorithm. This technique is capable of handling various goal task descriptions as well as incorporating both joint and task space constraints. The algorithm has shown promising preliminary results in planning joint path sequences for 3R and 4R planar robots to meet Cartesian tip tracking and goal endpoint planning. It is robust with respect to local path planning problems such as singularity considerations and local minimum problems. Repetitive joint path solutions for cyclic end-effector tasks are also generated. Eventual goals of this work include implementation on full spatial robots, as well as provision of an interface for supervisory input to aid in path planning for more complex problems. Author

Petri nets are a well established modelling technique for analyzing parallel systems. When coupled with an event-driven operating system, Petri nets can provide an effective means for integrating and controlling the functions of distributed robotic applications. Recent work has shown that Petri net graphs can also serve as remarkably intuitive operator interfaces. In this paper, the advantages of using Petri nets as high-level controllers to coordinate robotic functions are outlined, the considerations for designing Petri net controllers are discussed, and simple Petri net structures for implementing an interface for operator supervision are presented. A detailed example is presented which illustrates these concepts for a sensor-based assembly application. Author (revised)

A system which employs the magnetic Barkhausen effect to measure micromagnetic Barkhausen emissions (E) in ferromagnetic materials using a time varying magnetic field was developed. A patent application was made (US patent application temporary no. 754,904 pending). It was observed that E is dependent on microstructure in different Fe, Ni, Co alloys, steel, and rare earth-Fe alloys. The ac excitation field used in the present developed system is essential, since superposition of ac excitation field on quasi dc field gives cleaner, more reproducible magnetic Barkhausen pulse waveforms. 30 Hz was found optimal for the excitation frequency, for very fast in situ measurements. E can be generated at different depths in the material by altering the excitation frequency; using a band pass filter, E can be detected over different frequency ranges. Instead of conventional count rate, techniques for analyzing the E were developed: pulse height spectrum analysis, frequency spectrum analysis, RMS voltage analysis, and pulse waveform analysis. A model was developed for the magnetic Barkhausen effect. DOE

USING NONLINEAR ACOUSTICS FOR NONDESTRUCTIVE MATERIALS CHARACTERIZATION AND EVALUATION
G. E. Dace, O. Buck, and R. B. Thompson 1992 5 p Presented at the Winter Annual Meeting of the ASME, Anaheim, CA, 8-13 Nov. 1992
(Contract W-7405-eng-82)
(DE93-004447; IS-M-727; CONF-921110-35) Avail: CASI HC A01/MF A01

A non-parabolic atomic potential explains a variety of acoustic observations such as stress effects on the sound velocity and acoustic harmonic generation caused by a continuous distortion of the wave. Additional nonlinearities come about by alloying additions and by dislocation vibrations or, in other words, by the initiation of plastic flow. Particularly dramatic are the effects due to the nucleation of a new phase, as well as free and internal surfaces. These observations make nonlinear acoustics a valuable tool for nondestructive materials characterization, particularly since relative changes appear to be roughly an order of magnitude larger than those observed in traditional linear acoustics. Our work is concentrating on using acoustic harmonic generation as the primary measurement. We are developing a technique that measures displacement amplitudes using fluid-coupled contact transducers. First experiments on fused silica to test the system will be followed by the determination of solid solution effects of Cu in Al including the well-known precipitation sequences in this system during thermal aging. High resolution (greater than 4 line pairs per millimeter) computed tomography (CT) was studied for its potential use for engineering evaluation of aerospace components. The CT images provide two dimensional maps of material linear x ray attenuation coefficients for small volume elements, smaller than 0.001 cubic millimeters. These images are similar to micrographic images of polished surfaces from sectioned components, but are achieved nondestructively. For investigating materials where destructive sectioning relieves stresses, changing the internal configuration of features, such as gaps, high resolution CT provides superior diagnostic information for engineering evaluation. The primary benefits of CT are realized in accelerating schedules through faster data acquisition and reducing engineering risk by providing increased information nondestructively. High resolution CT is particularly well suited to assist in failure analysis investigations. Multiple slice or volume reconstruction high resolution CT can provide full three dimensional models. The cost and performance of high resolution CT systems are functions of the component size and ultimate resolution capability. For many common evaluation needs, the capital cost can be as low as a 50 percent cost add-on to a real-time radiographic imaging system. Relative to micrography, CT can be performed in about on-fifth the time, depending on the number of samples. GRA

NONDESTRUCTIVE EVALUATION OF ELECTRODEPOSITED CHROMIUM Final Report
Mark E. Todaro Nov. 1992 16 p
(AD-A259884; ARCCB-TR-92046) Avail: CASI HC A03/MF A01

Benet Laboratories is pursuing methods for nondestructively evaluating the quality and adhesion of electrodeposited chromium coatings on the bore of large caliber gun tubes. The Army currently has no suitable means for testing such coatings nondestructively. A poor quality or poorly adherent coating shows up only when several test rounds are fired through the tube, removing portions of the coating and exposing the steel underneath. Recent in-house work has investigated both photothermal and ultrasonic methods. The photothermal method involves briefly heating the surface of the chromium with a laser pulse. After the initial heating, the surface temperature decreases as heat diffuses into the coating and substrate. The characteristics of the coating, interface, and substrate affect the surface temperature profile in distinct ways. The temperature of the surface can be measured by observing the emitted infrared radiation with a focused detector or an infrared scanner. Although no experimental data using the photothermal technique has been obtained yet, a one-dimensional finite difference algorithm was used to model temperature changes on the surface of a chromium coating on steel due to an incident energy pulse. The model verifies that with a suitable choice of laser pulse width, one could measure the thermal characteristics of the coating and detect the presence of a thermal discontinuity at the interface. ULTRASONIC INSPECTION OF FILAMENT WOUND GRAPHITE EPOXY CYLINDERS Final Report
Lisa A. Tardiff and Bradley M. Taher, III Sep. 1992 30 p
(AD-A260361; MTL-TR-92-61) Avail: CASI HC A03/MF A01

A nondestructive inspection procedure utilizing ultrasonic C-scan imaging was developed to test cylindrical filament wound graphite epoxy rocket motor cases. These cylinders are part of a joint U.S. Army, Navy, NASA, and Air force (JANNAF) research round robin to evaluate destructive testing techniques for this type of composite. The rocket motor cases are made from T650/42 graphite fibers (Amoco) in a Lincoln Resin Formulation (LRF) and have six layers (twelve plies). The ultrasonic method used to evaluate the rocket motor cases was immersion, pulse-echo defect C-scans. Difficulties and solutions of using this method to evaluate the rocket motor cases are discussed. The received ultrasonic signals were evaluated for reflections from discontinuities within the material by means of an electronic gate set between the front and back surface reflections. The signals were then imaged in color on a computer according to the amplitude of the reflections. The resultant color C-scans were evaluated to separate the good from the bad. In some rocket motor cases there appeared to be large delaminations and inclusions. There were also some that showed few or no defect indications. Ultrasonic attenuation and time-of-flight (velocity) scans were performed to evaluate their quality. Contact time-of-flight measurements were also taken on a number of cylinders to verify immersion results. Comparisons are made with transverse compression, transverse tension, and in-plane shear destructive test results. These comparisons verify the usefulness of electronically gated ultrasonic immersion, pulse echo, defect C-scans on filament wound cylinders. GRA

MODELS AND ANALYSIS FOR MULTIVARIATE FAILURE TIME DATA
Ph.D. Thesis
Joanna Huang Shih 1992 186 p
Avail: Univ. Microfilms Order No. DA9234021

The goal of this research is to develop and investigate models and analytic methods for multivariate failure time data. We compare models in terms of direct modeling of the margins, flexibility of dependency structure, local vs. global measures of association, and ease of implementation. In particular, we study copula models, and models produced by right neutral cumulative hazard functions and right neutral hazard functions. We examine the changes of association over time for families of bivariate distributions induced from these models by displaying their density contour plots, conditional density plots, correlation curves of Doksum et al, and local cross ratios of Oakes. We know that bivariate distributions with same margins might exhibit quite different dependency structures. In addition to modeling, we study estimation procedures. For copula models, we investigate three estimation procedures. the first procedure is full maximum likelihood. The second procedure is two-stage maximum likelihood. At stage 1, we estimate the parameters in the margins by maximizing the marginal likelihood. At stage 2, we estimate the dependency structure by fixing the margins at the estimated ones. The third procedure is two-stage partially parametric maximum likelihood. It is similar to the second procedure, but we estimate the margins by the Kaplan-Meier estimate. We derive asymptotic properties for these three estimation procedures and compare their efficiency by Monte-Carlo simulations and direct computations. For models produced by right neutral cumulative hazards and right neutral hazards, we derive the likelihood and investigate the properties of the maximum likelihood estimates. Finally, we develop goodness of fit tests for the dependency structure in the copula models. We derive a test statistic and its asymptotic properties based on the test of homogeneity of Zelterman and Chen (1988), and a graphical diagnostic procedure based on the empirical Bayes approach. We study the performance of these two methods using actual and computer generated data. Dissert. Abstr.

The Heavy Section Steel Technology Program (HSST) is investigating the influence of flaw depth on the fracture toughness of reactor pressure vessel (RPV) steel. Recently, it has been shown that shallow cracks tend to exhibit an elevated toughness as a result of a loss of constraint at the crack tip. The loss of constraint takes place when interaction occurs between the elastic-plastic crack-tip stress field and the specimen surface nearest the crack tip. An increased shadow-crack fracture toughness is of interest to the nuclear industry because probabilistic fracture-mechanics evaluations show that shallow flaws play a dominant role in the probability of vessel failure during postulated pressurized-thermal-shock (PTS) conditions. The HSST investigation is a joint analytical/experimental study combining the use of shallow-cracked laboratory specimens with RPV analysis. All tests were performed on beam specimens loaded in 3-point bending using specimens about 100 mm deep. Primarily two crack depths have been considered: a = 50 and 9 mm (a/W = 0.5 and 0.1). Test results indicate a significant increase in the fracture toughness associated with the shallow flaw specimens in the lower transition region compared to the conventional fracture toughness. The testing produced a limited database of fracture-toughness values as a function of crack depth which can be used in probabilistic or deterministic fracture mechanics analyses of pressure vessel integrity. Final test results from the shallow-crack fracture toughness program are included. Examination of previously tested thermal shock data reveals that no toughness elevation appears to be present even though the thermal shock cylinders were tested with shallow flaws. DOE

The capabilities of the computer code CSTEM (Coupled Structural/Thermal/Electro-Magnetic Analysis) are discussed and demonstrated. CSTEM computationally simulates the coupled response of layered multi-material composite structures subjected to simultaneous thermal, structural, vibration, acoustic, and electromagnetic loads and includes the effect of aggressive environments. The composite material behavior and structural response is determined at its various inherent scales: constituents (fiber/matrix), ply, laminate, and structural component. The thermal and mechanical properties of the constituents are considered to be nonlinearly dependent on various parameters such as temperature and moisture. The acoustic and electromagnetic properties also include dependence on vibration and electromagnetic wave frequencies, respectively. The simulation is based on a three dimensional finite element analysis in conjunction with composite mechanics and with structural tailoring codes, and with acoustic and electromagnetic analysis methods. An aircraft engine composite fan blade is selected as a typical structural component to demonstrate the CSTEM capabilities. Results of various coupled multi-disciplinary heat transfer, structural, vibration, acoustic, and electromagnetic analyses for temperature distribution, stress and displacement response, deformed shape, vibration frequencies, mode shapes, acoustic noise, and electromagnetic reflection from the fan blade are discussed for their coupled effects in hot and humid environments. Collectively, these results demonstrate the effectiveness of the CSTEM code in capturing the coupled effects on the various responses of composite structures subjected to simultaneous multiple real-life loads. Aerospace components are often subjected to pyroshock events during flight and deployment, and must be qualified to this frequently severe environment. Laboratory simulation of pyroshock using a mechanically excited resonant fixture, has gained favor at Sandia for testing small (less than 8 inch cube) satellite and weapon components. With this method, each different shock environment required a different resonant fixture that was designed such that it's response reached the environment. A new test method has been developed which eliminates the need to have a different resonant fixture for each test requirement. This is accomplished by means of a tunable resonant fixture that has a response which is adjustable over a wide frequency range. The adjustment of the fixture's

response is done in a simple and deterministic way. This report covers the first phase of this research, which includes design conception through fabrication and evaluation of hardware capable of testing components with up to a 10 inch x 10 inch base. This method will ultimately allow the testing of much larger items, perhaps as large as entire small satellites.

MICROPARTICLE IMPACTS AT ULTRAHIGH VELOCITIES AND THEIR RELATION TO MACROPARTICLE IMPACTS
J. M. Walsh, G. L. Stradling, G. C. Idzorek, B. P. Shafer, and H. L. Curling, Jr. 1992 12 p Presented at the Hypervelocity Impact Symposium, Austin, TX, 17-20 Nov. 1992
(Contract W-7405-eng-36)
(DE93-003845; LA-UR-92-3810; CONF-921162-13) Avail: CASI HC A03/MF A01

The Hypervelocity Microparticle Impact project at Los Alamos has utilized electrostatically accelerated iron spheres of microscopic dimensions to generate ultra-high velocity impact experiments to about 100 km/S, an order of magnitude beyond data range for precisely controlled impact tests with ordinary macroscopic projectiles. Extreme smallness of the micro impact events brings into question whether usual shock-hydrodynamic size scaling can be assumed. Validity of size scaling (and its refinement) is questioned in the present study. Impact experiments are compared in which two impact events at a given velocity, a microscopic impact and a macroscopic impact, are essentially identical except that the projectile masses and crater volumes differ by nearly 12 orders of magnitude -- linear dimensions and times differing by 4 orders of magnitude. Strain rates at corresponding points in a deforming crater increase 4 orders of magnitude with the size reduction. Departures from exact scaling, by a factor of 3.7 in crater volume, are observed for copper targets -- with micro craters being smaller than scaling would predict. Measurement of impact craters for very small impact events leads to determination of metal yield stresses at strain rates more than two orders of magnitude greater than have been obtained by other methods. Determination of material strengths at these exceedingly high strain rates is important. Results are compared to recent theoretical models by Follansbee, Kochs and Rollett. The problem is addressed of predicting crater sizes in a target material with strain rate effects. Basic results are recalled on the late stage equivalence of hypervelocity impacts. For the strain rate dependent material to show that the curve of dimensionless crater volume versus impact velocity is replaced by a family of curves, each member of which is for one final crater size. The spacing of the curves is determined by the stress versus strain properties of the material.

A MODAL TEST OF A SPACE-TRUSS FOR STRUCTURAL PARAMETER IDENTIFICATION
T. G. Carne, R. L. Mayes, and M. B. Levine-West (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) 1992 10 p Presented at the 11th International Modal Analysis Conference, Kissimmee, FL, 1-4 Feb. 1993
(Contract DE-AC04-76DP-00789)
(DE93-004043; SAND-92-2367C; CONF-930241-1) Avail: CASI HC A02/MF A01

The Jet Propulsion Laboratory is developing a large space-truss to support a micro-precision interferometer. A finite element model will be used to design and place passive and active elements in the truss to suppress vibration. To improve the model's predictive capability, it is desirable to identify uncertain structural parameters in the model by utilizing experimental modal data. Testing of both the components and the system was performed to obtain the data necessary to identify the structural parameters. Extracting a modal model, absent of bias errors, from measured data requires great care in test design and implementation. Testing procedures that are discussed include: verification of non-constraining shaker attachment, quantification of the non-linear structural response, and the design and effects of suspension systems used to simulate a free structure. In addition to these procedures, the accuracy of the measured frequency response functions are evaluated by comparing functions measured with random excitation, using various frequency resolutions, and with step sine excitation.

The JPL Micro-Precision Interferometer (MPI) is a testbed for studying the use of control-structure interaction technology in the design of space-based interferometers. A layered control architecture will be employed to regulate the interferometer optical system to tolerances in the nanometer range. An important aspect of designing and implementing the control schemes for such a system is the need for high fidelity, test-verified analytical structural models. This paper summarizes coordinated test and analysis efforts aimed at producing such a model for the MPI structure. Pretest analysis, modal testing and test-analysis reconciliation results are summarized for a series of tests at both the component and full system levels.

THEORIES OF ELASTOPLASTICITY COUPLED WITH CONTINUUM DAMAGE MECHANICS
N. R. Hansen Jan. 1993 197 p
(Contract DE-AC04-76DP-00789)
(DE93-007426; SAND-92-1436) Avail: CASI HC A09/MF A03

Inelastic material constitutive relations for elastoplasticity coupled with continuum damage mechanics are investigated. For elastoplasticity, continuum damage mechanics, and the coupled formulations, rigorous thermodynamic frameworks are derived. The elastoplasticity framework is shown to be sufficiently general to encompass J(sub 2) plasticity theories including general isotropic and kinematic hardening relations. The concepts of an intermediate undamaged configuration and a fictitious deformation gradient are used to develop a damage representation theory. An empirically-based, damage evolution theory is proposed to overcome some observed deficiencies. Damage deactivation, which is the negation of the effects of damage under certain loading conditions, is investigated. An improved deactivation algorithm is developed for both damaged elasticity and coupled elastoplasticity formulations. The applicability of coupled formulations is validated by comparing theoretical predictions to experimental data for a spectrum of materials and loads paths. The pressure-dependent brittle-to-ductile transitional behavior of concrete is replicated. The deactivation algorithm is validated using tensile and compression data for concrete. For a ductile material, the behavior of an aluminum alloy is simulated including the temperature-dependent ductile-to-brittle behavior features. The direct application of a coupled model to fatigue is introduced. In addition, the deactivation algorithm in conjunction with an assumed initial damage and strain is introduced as a novel method of simulating the densification phenomenon in cellular solids.

The feasibility of generating precise thermomechanical deformation data to support constitutive model development was investigated. Here, the requirement is for experimental data that is free from anomalies caused by less than ideal equipment and procedures. A series of exploratory tests conducted on Hastelloy X showed that generally accepted techniques for strain controlled tests were lacking in at least three areas. Specifically, problems were encountered with specimen stability, thermal strain compensation, and temperature/mechanical strain phasing. The source of these difficulties was identified and improved thermomechanical testing techniques to correct them were developed. These goals were achieved by developing improved procedures for measuring and controlling thermal gradients and by designing a specimen specifically for thermomechanical testing. In addition, innovative control strategies were developed to correctly proportion and phase the thermal and mechanical components of strain. Subsequently, the improved techniques were used to generate deformation data for Hastelloy X over the temperature range, 200 to 1000 C. Author

INCREMENTAL, QUASISTATIC, UNIAXIAL FINITE ELEMENT ANALYSIS IN THE LINEAR VISCOELASTICITY THEORY, EXEMPLARILY DEMONSTRATED BY THE BURGER MATERIAL Ph.D. Thesis [INKREMENTELLE, QUASISTATISCHE, EINACHSIGE FE-ANALYSE IN DER LINEAREN VISKOELASTIZITAERSTHEORIE AM BEISPIEL DES BURGER-MATERIALS]
Helmut Schmeitzner 1992 109 p In GERMAN
(ETN-93-93422) Avail: CASI HC A06/MF A02

The advantage of linear viscoelastic material description in the framework of finite element analysis is demonstrated. The material theoretical principles of linear viscoelastic material description are made available. The Burger material is presented, which incorporates all essential material properties of viscoelastic materials. A survey of computation processes is given for the quasistatic system analysis. A spatial column and a plane beam element are formulated, using the uniaxial, incremental Burger material law. Computation examples are presented. ESA

TEMPORAL IDENTIFICATION OF LINEAR AND NONLINEAR STRUCTURES Ph.D. Thesis [IDENTIFICATION TEMPORELLE DES STRUCTURES LINEARIES ET NONLINEAIRES]
Bagus Budiwantoro 1990 186 p In FRENCH
(ECL-90-33; ETN-93-91948) Avail: CASI HC A09/MF A02

The identification of linear dynamic structures and the identification of nonlinear systems are addressed. The first problem is written under several representations in order to obtain the relations to extract the characteristic frequencies and the damping factors. A technique for choosing the number of degrees of freedom to be taken into account at system identification is developed and a method for normal mode calculation using a subdetermination of complex modes is used. For the second problem, the principal causes of nonlinearity and their influence on the dynamic behavior of the structural mechanics are analyzed. Numerical methods to solve linear equations are addressed, and various methods for identification of nonlinear models are presented. Results are applied to nonlinear systems with several degrees of freedom. ESA

SCBUCKLE USER'S MANUAL: BUCKLING ANALYSIS PROGRAM FOR SIMPLE SUPPORTED AND CLAMPED PANELS
Juan R. Cruz Mar. 1993 27 p
(RTOP 505-63-50-08)
(NASA-TM-107741; NAS 1.15:107741) Avail: CASI HC A03/MF A01

The program SCBUCKLE calculates the buckling loads and mode shapes of cylindrically curved, rectangular panels. The panel is assumed to have no imperfections. SCBUCKLE is capable of analyzing specially orthotropic symmetric panels (i.e., A(sub 16) = A(sub 26) = 0.0, D(sub 16) = D(sub 26) = 0.0, B(sub ij) = 0.0). The analysis includes first-order transverse shear theory and is capable of modeling sandwich panels. The analysis supports two types of boundary conditions: either simply supported or clamped on all four edges. The panel can be subjected to linearly varying normal loads N(sub x) and N(sub y) in addition to a constant shear load N(sub xy). The applied loads can be divided into two parts: a preload component; and a variable (eigenvalue-dependent) component. The analysis is based on the modified Donnell's equations for shallow shells. The governing equations are solved by Galerkin's method. Author (revised)

INVESTIGATION OF AZIMUTHAL STRESSES DUE TO WELDING AND COOLDOWN
M. Lindner and S. Mulhall 1992 3 p Presented at the 4th International Industrial Symposium on the Super Collider, New Orleans, LA, 4-6 Mar. 1992
(Contract DE-AC02-76CH-00016)
(DE93-005530; BNL-47862; CONF-920331-61) Avail: CASI HC A01/MF A01

For some time, it has been known that a prestress in the cold mass skin surrounding the yoke was desirable for the prevention of unwanted 'loose' coil effects on the performance of magnets. From practical experience, it was determined that the hoop stresses developed by seam welding were adequate to provide the desired preload on the coils. The tests reported here were intended to: (1) determine the stresses developed by welding; (2) attempt to determine the friction coefficient between the yoke laminations and the stainless steel shell; (3) determine the effects of repeated cooldown cycles on the stresses in the shell. EFFECT OF THE FLAP AND EDGEWISE BENDING MOMENT PHASE RELATIONSHIPS ON THE FATIGUE LOADS OF A TYPICAL HAWT BLADE
H. J. Sutherland 1992 7 p Presented at the 12th American Society Mechanical Engineers Wind Energy Symposium, Houston, TX, 31 Jan. - 4 Feb. 1993
(Contract DE-AC04-76DP-00789)
(DE93-003253; SAND-92-1665C; CONF-930153-1) Avail: CASI HC A02/MF A01

The load spectrum unposed upon a horizontal-axis wind turbine blade is typically decomposed into two primary bending moments; flap and edgewise bending. The critical fatigue loads (stress cycles) imposed on the blade may not be on one of these axes, especially if die two bending loads are in-phase with one another. To quantify the correlation of these two bending moments and determine the impact of this correlation on off-axis fatigue loads, an extensive data set for a typical wind turbine blade is examined. The results are compared using their respective cycle count matrices. These results illustrate that the harmonic components of die principal bending stresses are correlated, and that the random components are not. The analysis techniques described in the paper provide the turbine designer with a spectral technique for combining primary bending spectra into off-axis fatigue loads. DOE

ANALYSIS OF AUTOMATED FATIGUE CRACK GROWTH RATE DATA
Gary Marquis 1992 30 p
(DE93-752853; VTT-PUB-108) Avail: CASI HC A03/MF A01

Automated crack length measuring methods have largely replaced manual techniques in many applications. They require little operator time and have the additional feature of being able to collect large amounts of data. A method for compressing a large number of crack length observations into

a smaller number of crack length estimates suitable for calculating the fatigue crack growth rate is described and verified using a simulation technique. With this method, the effective crack length measuring precision is improved and the amount of crack growth rate data obtainable from a single specimen is increased. Test times for threshold testing can also be potentially decreased. This method has been incorporated into a computer program, SAERMAE, currently in use in VTT Metals Laboratory. DOE

MASSIVELY PARALLEL MOLECULAR DYNAMICS SIMULATIONS OF TWO-DIMENSIONAL MATERIALS AT HIGH STRAIN RATES
N. J. Wagner and B. L. Holian 1992 18 p Presented at the Material Research Society Symposium, Boston, MA, 2-6 Dec. 1992
(Contract W-7405-eng-36)
(DE93-003825; LA-UR-92-3737; CONF-921206-4) Avail: CASI HC A03/MF A01

Large scale molecular dynamics simulations on a massively parallel computer are performed to investigate the mechanical behavior of 2-dimensional materials. A pair potential and a model embedded atom many-body potential are examined, corresponding to 'brittle' and 'ductile' materials, respectively. A parallel molecular dynamics (MD) algorithm is developed to exploit the architecture of the Connection Machine, enabling simulations of greater than 10(exp 6) atoms. A model spallation experiment is performed on a 2-D triagonal crystal with a well-defined nanocrystalline defect on the spall plane. The process of spallation is modeled as a uniform adiabatic expansion. The spall strength is shown to be proportional to the logarithm of the applied strain rate and a dislocation dynamics model is used to explain the results. Good predictions for the onset of spallation in the computer experiments is found from the simple model. The nanocrystal defect affects the propagation of the shock front and failure is enhanced along the grain boundary. DOE

THE ROLE OF PASSIVE SURFACE FILMS ON CORROSION FATIGUE CRACK INITIATION
A. W. Thompson 1992 7 p
(Contract DE-FG02-84ER-45149)
(DE93-006512; DOE/ER-45149/3) Avail: CASI HC A02/MF A01

Fatigue testing on commercially pure titanium with low and high oxygen contents, chosen to produce quite different slip behaviors, wavy and planar, respectively, was carried out in air and in 1M H2SO4 solution, a strongly passivating environment for Ti. Goal was comparison of experimental fatigue data with a published model which rationalizes fatigue crack initiation under passive corrosion conditions. Although the general features of the experimental data were consistent with the tenets of the model, as was also the case in prior work using the stainless steel superalloy A-286, it appeared that the passivation conditions were so strong as to preclude the primary event proposed as the basis for the model, namely the emergence of slip steps through the passive film, thus permitting corrosive fatigue crack initiation. It is possible that choice of a less strong passivating environment would permit a better comparison of model and experiment for the CP Ti, an otherwise suitable experimental material. DOE

FRACTURE TOUGHNESS (K(SUB Ic) AND GAMMA wof) OF A HIPed Si3N4 AT ELEVATED TEMPERATURES
A. A. Wereszczak, M. K. Ferber, R. R. Sanders, M. G. Jenkins, and P. Khandelwal 1993 32 p Presented at the 17th Annual Conference on Composites and Advanced Ceramics, Cocoa Beach, FL, 11-15 Jan. 1993
(Contract DE-AC05-84OR-21400)
(DE93-006745; CONF-930164-6) Avail: CASI HC A03/MF A01

Chevron-notched bend bars of a hot isostatically pressed (HiPed) silicon nitride (PY6) were tested in three-point flexure in air at 25, 1000, 1200, 1300, and 1400 C. Stable crack growth was consistently produced at all the test temperatures. Average fracture toughness, K(sub Ic), and work of fracture, gamma(sub wof), decreased from 6.4 MPa(sm bullet)(radical)m and 52 J/sq m, respectively, at 25C to 4.5 MPa(sm bullet)(radical)m and 44 J/sq m at 1200 C; a 29 percent and 15 percent decrease in K(sub Ic) and gamma(sub wof). Tests conducted at 1300 C and 1400 C activated high temperature deformation mechanisms, which effectively caused greater specimen ductility and apparent greater fracture resistances. At 1400 C, K(sub Ic) and gamma(sub wof) were 6.5 MPa(sm bullet)(radical)m and 159 J/sq m, respectively. DOE

PYROSHOCK SIMULATION FOR SATELLITE COMPONENTS USING A TUNABLE RESONANT FIXTURE, PHASE 1
N. T. Davie and V. I. Bateman Oct. 1992 66 p
(Contract DE-AC04-76DP-00789)
(DE93-005382; SAND-92-2135) Avail: CASI HC A04/MF A01

Aerospace components are often subjected to pyroshock events during flight and deployment and must be qualified to this frequently severe environment. Laboratory simulation of pyroshock using a mechanically excited resonant fixture, has gained favor at Sandia for testing small (less than 8 inch cube) weapon components. With this method, each different shock environment required a different resonant fixture that was designed such that it's response matched the environment. A new test method was developed which eliminates the need to have a different resonant fixture for each test requirement. This is accomplished by means of a tunable resonant fixture that has a response which is adjustable over a wide frequency range. The adjustment of the fixture's response is done in a simple and deterministic way. This report covers the first phase of this research, which includes design conception through fabrication and evaluation of hardware capable of testing components with up to a 10 inch x 10 inch base. This method will ultimately allow the testing of much larger items, perhaps as large as entire small satellites. DOE

IMPLEMENTATION OF THE BLOCK-KRYLOV BOUNDARY FLEXIBILITY METHOD OF COMPONENT SYNTHESIS
Kelly S. Carney, Ayman A. Abdallah (Analex Corp., Brook Park, OH.), and Arthur A. Hucklebridge (Case Western Reserve Univ., Cleveland, OH.) May 1993 22 p Proposed for presentation at the 1993 MSC World User's Conference, Washington, DC, 24-28 May 1993; sponsored by the MacNeal-Schwendler Corp.
(NASA-TM-106065; E-7671; NAS 1.15:106065) Avail: CASI HC A03/MF A01

A method of dynamic substructuring is presented which utilizes a set of static Ritz vectors as a replacement for normal eigenvectors in component mode synthesis. This set of Ritz vectors is generated in a recurrence

relationship, which has the form of a block-Krylov subspace. The initial seed to the recurrence algorithm is based on the boundary flexibility vectors of the component. This algorithm is not load-dependent, is applicable to both fixed and free-interface boundary components, and results in a general component model appropriate for any type of dynamic analysis. This methodology was implemented in the MSC/NASTRAN normal modes solution sequence using DMAP. The accuracy is found to be comparable to that of component synthesis based upon normal modes. The block-Krylov recurrence algorithm is a series of static solutions and so requires significantly less computation than solving the normal eigenspace problem.

J-INTEGRAL OF CIRCUMFERENTIAL CRACK IN LARGE DIAMETER PIPES

Wei Ji (South Carolina Univ., Columbia.), Yuh J. Chao (South Carolina Univ., Columbia.), M. A. Sutton (South Carolina Univ., Columbia.), P. S. Lam, and G. E. Mertz 1992 11 p Presented at the 2nd International Conference on Nuclear Engineering, San Francisco, CA, 21-24 Mar. 1992

(Contract DE-AC09-89SR-18035)

(DE93-003708; WSRC-MS-92-320; CONF-9203208-1) Avail: CASI HC A03/MF A01

Large diameter thin-walled pipes are encountered in a low pressure nuclear power piping system. Fracture parameters such as K and J, associated with postulated cracks, are needed to assess the safety of the structure, for example, prediction of the onset of tile crack growth and the stability of the crack. The Electric Power Research Institute (EPRI) has completed a comprehensive study of cracks in pipes and handbook-type data is available. However, for some large diameter, thin-walled pipes the needed information is not included in the handbook. This paper reports our study of circumferential cracks in large diameter, thin-walled pipes (R/t=30 to 40) under remote bending or tension loads. Elastic-Plastic analyses using the finite element method were performed to determine the elastic and fully plastic J values for various pipe/crack geometries. A non-linear Ramberg-Osgood material model is used with strain hardening exponents (n) that range from 3 to 10. A number of circumferential, through thickness cracks were studied with half crack angles ranging from 0.063(pi) to 0.5(pi). Results are tabulated for use with the EPRI estimation scheme.

PROBABILISTIC FINITE ELEMENTS FOR FATIGUE AND FRACTURE ANALYSIS Final Report

Ted Belytschko and Wing Kam Liu Apr. 1993 61 p

(Grant NAG3-822; RTOP 584-03-11)

(NASA-CR-191098; E-7711; NAS 1.26:191098) Avail: CASI HC A04/MF A01

An overview of the probabilistic finite element method (PFEM) developed by the authors and their colleagues in recent years is presented. The primary focus is placed on the development of PFEM for both structural mechanics problems and fracture mechanics problems. The perturbation techniques are used as major tools for the analytical derivation. The following topics are covered: (1) representation and discretization of random fields; (2) development of PFEM for the general linear transient problem and nonlinear elasticity using Hu-Washizu variational principle; (3) computational aspects; (4) discussions of the application of PFEM to the reliability analysis of both brittle fracture and fatigue; and (5) a stochastic computational tool based on stochastic boundary element (SBEM). Results are obtained for the reliability index and corresponding probability of failure for: (1) fatigue crack growth; (2) defect geometry; (3) fatigue parameters; and (4) applied loads. These results show that initial defect is a critical parameter.

HIGH TEMPERATURE COMPOSITE ANALYZER (HITCAN) PROGRAMMER'S MANUAL. VERSION 1.0

J. J. Lackney, P. L. N. Murthy (National Aeronautics and Space Administration. Lewis Research Center, Cleveland, OH.), and P. K. Gotsis (National Aeronautics and Space Administration. Lewis Research Center, Cleveland, OH.) Apr. 1993 133 p

(Grant NAG3-25266; RTOP 505-63-5B)

(NASA-TM-106004; E-7547; NAS 1.15:106004) Avail: CASI HC A07/MF A02

This manual describes the organization and flow of data and analysis modules in the computer code, HITCAN (High Temperature Composite ANalyzer). HITCAN is a general purpose computer program for predicting nonlinear global structural and local stress-strain response of arbitrarily oriented, multilayered high temperature metal matrix composite structures. This manual describes the architecture of the HITCAN code, followed by the listing of subroutines and calling tree, data storage scheme, file system, and a dictionary of code terminology. The primary intention of the manual is to familiarize the user with some of the computer program related issues so as to facilitate maintenance/modification/updates of the HITCAN computer code.

X RAY ABSORPTION FINE STRUCTURE STRAIN DETERMINATION IN THIN FILMS Ph.D. Thesis

Guy Arthur DeRose 1992 204 p

Avail: Univ. Microfilms Order No. DA9236314

X-ray Absorption Fine Structure (XAFS) spectroscopy was examined, for the first time, as a technique for the determination of elastic strain in thin evaporated films and thin foils. The electron yield and fluorescence yield detection techniques were used to collect the XAFS data. For sensitivity reasons, back-reflection X-Ray Diffraction (XRD) was also carried out. Continuum mechanics was used to model the deformation of the first shell and was compared to experimental observations. A local, non-linear elastic strain was observed by XAFS and is the same quantity measured by XRD. In general, the measured magnitude of the XAFS strain was found to be less than the model predicts, and relaxation of the stress in the substrate or the foil is suggested as the responsible mechanism. PRELIMINARY ANALYSIS TECHNIQUES FOR RING AND STRINGER STIFFENED CYLINDRICAL SHELLS

J. Graham Mar. 1993 104 p

(NASA-TM-108399; NAS 1.15:108399) Avail: CASI HC A06/MF A02

This report outlines methods of analysis for the buckling of thin-walled circumferentially and longitudinally stiffened cylindrical shells. Methods of analysis for the various failure modes are presented in one cohesive package. Where applicable, more than one method of analysis for a failure mode is presented along with standard practices. The results of this report are primarily intended for use in launch vehicle design in the elastic range. A Microsoft Excel worksheet with accompanying macros has been developed to automate the analysis procedures.

The behavior of a model pressure vessel on a pressurized thermal shock loading is studied. The finite element analyses for the 4th, 5th, and 6th thermoshock tests with the first model pressure vessel are described. In the 4th and 5th tests, a sharp precrack was produced before the test. In the 6th test, the old crack was used. According to the measurements and a post test ultrasonic examination of the crack front, the sixth test led to significant crack extension. Both temperatures and stresses were calculated using the finite element method. The calculations were made using the idealized initial flaw geometry and preliminary material data. Both two and three dimensional models were used in the calculations. J integral values were calculated from the elastic plastic finite element results. The stress intensity factor values were evaluated on the basis of the calculated

J integrals and compared with the preliminary material fracture toughness data obtained. When the calculated temperatures, strains and crack opening displacements are compared to measured values, a sufficient agreement is observed. The calculated stress intensity factor exceeds the preliminary material fracture toughness value and thus crack initiation is predicted.

ASSESSMENT OF CRACK GROWTH IN A SPACE SHUTTLE MAIN ENGINE FIRST-STAGE, HIGH-PRESSURE FUEL TURBOPUMP BLADE
Ali Abdul-Aziz Mar. 1993 19 p Original contains color illustrations
(Contract NAS3-25266; RTOP 553-13-00)
(NASA-CR-190782; E-7396; NAS 1.26:190782) Avail: CASI HC A03/MF A01; 4 functional color pages

A two-dimensional finite element fracture mechanics analysis of a space shuttle main engine (SSME) turbine blade firtree was performed using the MARC finite element code. The analysis was conducted under combined effects of thermal and mechanical loads at steady-state conditions. Data from a typical engine stand cycle of the SSME were used to run a heat transfer analysis and, subsequently, a thermal structural fracture mechanics analysis. Temperature and stress contours for the firtree under these operating conditions were generated. High stresses were found at the firtree lobes where crack initiation was triggered. A life assessment of the firtree was done by assuming an initial and a final crack size. Author

AN INVESTIGATION INTO THE MULTIAXIAL FATIGUE BEHAVIOR OF IMI 829 TITANIUM ALLOY Ph.D. Thesis
Daniel Edward Gerbec 1992 149 p
Avail: Univ. Microfilms Order No. DA9236269

This document studies the effect that multiaxial stress fields have on the fatigue behavior of IMI 829 titanium alloy, a material often used for compressor disks in gas turbine engines. Experimentation in this study has included the cyclic testing of rotating disk specimens of varying geometries as well as ASTM E-647 crack growth testing employing standard compact tension specimens. Fractographic and microstructural examinations were also conducted. It was observed that the disk specimens demonstrated lower crack growth rates for a given stress intensity range than did the compact tension specimens. This behavior was explained by considering the effect of the multiaxial stress field on the crack tip opening displacement. Any loads parallel to a given crack will effectively reduce the crack tip opening displacement due to the Poisson effect, resulting in a smaller crack tip plastic zone which has been previously related to crack growth rate. Fractographic examination of the disk and compact tension specimens indicated that the disk specimens were much more likely to form striations than did the compact tension specimens. This was explained by the fact that the test conditions differed between the disk and compact tension specimens. Due to mechanical limitations, the cyclic frequency of the disk specimens was considerably lower than the cyclic frequency of the compact tension tests. Differences in test temperature may also have influenced the change in fracture surface between the specimens. The effect that microstructure had on the fatigue crack growth in the disk specimens was investigated as well. It was observed that crack generally followed a transgranular path. It was also noted that when possible, the crack would attempt to cross prior beta grain boundaries at right angles. The existence of grain boundary aligned alpha was found to influence this behavior.

DYNAMIC RESPONSE AND STABILITY OF SEMI-RIGID FRAMES Ph.D. Thesis
Omar Ali Abu-Yasein 1992 233 p
Avail: Univ. Microfilms Order No. DA9235766

This dissertation presents a method to determine the load capacity as well as end member forces and deformations of frames with partial rigid joint connections by using the direct stiffness method. The connections are modeled as rotational springs attached at the ends of framed members. The lumped mass method, which is an approximate method, and the distributed mass method, which is an exact method, are also presented to compute the natural frequency of frames. The effects of the axial forces and the flexibility of joint connections are both included. Furthermore, the time-dependent response of semi-rigid frames subjected to periodic axial forces is formulated. The harmonic function is approximated by dividing the periodic function into n intervals and the periodic axial forces are evaluated at each time interval as constant forces using 'piecewise approximation'. The regions of instability of frames with different joint stiffness were determined using the characteristic equation method. The time-dependent part of the differential equation for free vibration of a framed member subjected to a harmonic force can be written in the form of the Mathieu-Hill equation where all characteristics of the Mathieu-Hill equation solutions can be used to determine the boundaries of instability regions.

APPLICATION OF THE BOUNDARY ELEMENT METHOD TO FINITE ELASTICITY Ph.D. Thesis
Husain Jubran Algahtani 1992 104 p
Avail: Univ. Microfilms Order No. DA9233853

A boundary element method solution for the problem of finite plane deformation of elastic compressible and incompressible solids is presented. Two types of constitutive relation are considered: the Blatz-Ko model for compressible materials and the Mooney-Rivlin model for incompressible materials. The finite elasticity solution is obtained by solving the nonlinear boundary element equations using an iterative procedure. The iterative procedure is implemented in two computer codes which can be used to solve the problem of plane finite elasticity of Blatz-Ko and Mooney-Rivlin materials, respectively. The computer codes were tested using several numerical examples.

CORRELATION OF GROUND TESTS AND ANALYSES OF A DYNAMICALLY SCALED SPACE STATION MODEL CONFIGURATION
Mehzad Javeed (Lockheed Engineering and Sciences Co., Hampton, VA.), Harold H. Edighoffer (Analytical Services and Materials, Inc., Hampton, VA.), and Paul E. McGowan Mar. 1993 14 p Proposed for presentation at the 34th Structures, Structural Dynamics, and Materials Conference, La Jolla, CA, 19-21 Apr. 1993
(RTOP 585-03-11-09)
(NASA-TM-107729; NAS 1.15:107729) Avail: CASI HC A03/MF A01

Verification of analytical models through correlation with ground test results of a complex space truss structure is demonstrated. A multi-component, dynamically scaled space station model configuration is the focus structure for this work. Previously established test/analysis correlation procedures are used to develop improved component analytical models. Integrated system analytical models, consisting of updated component analytical models, are compared with modal test results to establish the accuracy of system-level dynamic predictions. Design sensitivity model updating methods are shown to be effective for providing improved component analytical models. Also, the effects of component model accuracy and interface modeling fidelity on the accuracy of integrated model predictions is examined. Author

(DE93-003846; LA-UR-92-3811; CONF-921162-12) Avail: CASI HC A03/MF A01

Cratering experiments performed under carefully controlled conditions at impact velocities ranging from 3 km/s to 30 km/s into a wide variety of target materials are presented. These impact experiments use the 6 MV vertical Van de Graaff accelerator of the Ion Beam Facility at the Los Alamos National Laboratory to electrostatically accelerate highly charged iron microspheres. The sub-micron spheres, from a random size distribution, are shocklessly accelerated along an 8 m flight path. Ultra-sensitive charge detectors monitor the passage of the projectiles at a rate of up to 100

projectiles/second. An online computer records and displays in real time the charge, velocity and mass of the projectiles and provides cross correlation between the events observed by the several in-flight charge detectors and impact detectors. Real-time logic controls an electrostatic kicker which deflects projectiles of selected charge and velocity onto the target. Thus each experiment consists of an ensemble of 10 to 40 impacts onto a single target within a narrow window of the projectile parameter space, providing excellent statistical resolution of each data point. The target materials used include single crystal copper and single crystal aluminum, gold, and quartz as well as pyrolytic graphic and epoxy used in composite materials of interest to space applications. We also conducted impact experiments onto thin Mylar and nickel foils. This paper presents these experiments and summarizes the cratering characterization performed to date. Emphasis is placed on cratering results in several materials over a range of impact velocities. DOE

CONSIDERATION OF HISTORY DEPENDENT DAMAGE IN CREEP CRACK GROWTH
F. W. Brust, Jr., P. Krishnaswamy, and B. S. Majumdar 1992 9 p Presented at the 10th Symposium on Energy Engineering Sciences: Synergism of Analysis, Modeling, and Experiment, Argonne, IL, 11-13 May 1992
(Contract DE-FG02-90ER-14135)
(DE93-004398; CONF-9205147-4) Avail: CASI HC A02/MF A01

The effects of load history on the creep crack growth process are discussed. There are three aspects of this problem which are considered: (1) the constitutive response of materials undergoing history dependent creep straining, (2) the corresponding crack growth behavior including a discussion of fracture parameters capable of predicting the response, and (3) experimental evidence of the importance of history dependent response. Finally, numerical studies which use the constitutive model and fracture theory of (1) and (2) respectively are used to examine the experimental results developed in (3). DOE

MOIRE INTERFEROMETRY AT HIGH TEMPERATURES Ph.D. Thesis
Jau-Je Wu 1992 132 p
Avail: Microfilms Order No. DA9301022

The objective of this study was to provide an optical technique allowing full-field in-plane deformation measurements at high temperature by using high-sensitivity moire interferometry. This was achieved by a new approach of performing deformation measurements at high temperatures in a vacuum oven using an achromatic interferometer. The moire system setup was designed with particular consideration for the stability, compactness, flexibility, and ease of control. A vacuum testing environment was provided to minimize the instability of the patterns by protecting the optical instruments from the thermal convection currents. Also, a preparation procedure for the high-temperature specimen grating was developed with the use of the plasma-etched technique. Gold was used as a metallic layer in this procedure. This method was demonstrated on a ceramic block, metal/matrix composite, and quartz. Thermal deformation of a quartz specimen was successfully measured in vacuum at 980 degrees Celsius, with the sensitivity of 417 nm per fringe. The stable and well-defined interference patterns confirmed the feasibility of the developments, including the high-temperature moire system and high-temperature specimen grating. The moire system was demonstrated to be vibration-insensitive. Also, the contrast of interference fringes at high temperature was enhanced by means of a spatial filter and a narrow band interference filter to minimize the background noise from the flow of the specimen and heater. The system was verified by a free thermal expansion test of an aluminum block. Good agreement demonstrated the validity of the optical design. The measurements of thermal deformation mismatch were performed on a graphite/epoxy composite, a metal/matrix composite equipped with an optical fiber, and a cutting tool bit. A high-resolution data-reduction technique was used to measure the strain distribution of the cutting tool bit. Dissert. Abstr.

FATIGUE CRITERION TO SYSTEM DESIGN, LIFE AND RELIABILITY: A PRIMER
Erwin V. Zaretsky Oct. 1992 18 p Workshop on Computational Methods for Failure Analysis and Life Prediction held in Hampton, VA, 14-15 Oct. 1992
(RTOP 505-63-5B)
(NASA-TM-106022; E-7736; NAS 1.15:106022) Avail: CASI HC A03/MF A01

A method for estimating a component's design survivability by incorporating finite element analysis and probabilistic material properties was developed. The method evaluates design parameters through direct comparisons of component survivability expressed in terms of Weibull parameters. The analysis was applied to a rotating disk with mounting bolt holes. The highest probability of failure occurred at, or near, the maximum shear stress region of the bolt holes. Distribution of material failure as a function of Weibull slope affects the probability of survival. Where Weibull parameters are unknown for a rotating disk, it may be permissible to assume Weibull parameters, as well as the stress-life exponent, in order to determine the qualitative effect of disk speed on the probability of survival. HIGH TEMPERATURE COMPOSITE ANALYZER (HITCAN) DEMONSTRATION MANUAL, VERSION 1.0
S. N Singhal, J. J. Lackney, and P. L. N. Murthy (National Aeronautics and Space Administration. Lewis Research Center, Cleveland, OH.) Apr. 1993 140 p
(Contract NAS3-25266; RTOP 505-63-5B)
(NASA-TM-106003; E-7546; NAS 1.15:106003) Avail: CASI HC A07/MF A02

This manual comprises a variety of demonstration cases for the HITCAN (HIgh Temperature Composite ANalyzer) code. HITCAN is a general purpose computer program for predicting nonlinear global structural and local stress-strain response of arbitrarily oriented, multilayered high temperature metal matrix composite structures. HITCAN is written in FORTRAN 77 computer language and has been configured and executed on the NASA Lewis Research Center CRAY XMP and YMP computers. Detailed description of all program variables and terms used in this manual may be found in the User's Manual. The demonstration includes various cases to illustrate the features and analysis capabilities of the HITCAN computer code. These cases include: (1) static analysis, (2) nonlinear quasi-static (incremental) analysis, (3) modal analysis, (4) buckling analysis, (5) fiber degradation effects, (6) fabrication-induced stresses for a variety of structures; namely, beam, plate, ring, shell, and built-up structures. A brief discussion of each demonstration case with the associated input data file is provided. Sample results taken from the actual computer output are also included. Author

Control objectives for large flexible space structures such as reorientation maneuvers, vibration suppression, fine pointing, and precision shape control require reliable and robust control algorithms. The modal characteristics of such structures including large order, low frequency with low damping, and closely spaced modes of vibration demand complexities in the control design which go beyond traditional methodologies and present difficult challenges. The Large Space Structures Technology Program at the Flight Dynamics Directorate of the Wright Laboratory was begun as an in-house experimental research program in the dynamics and control of flexible space structures. The 12-Meter Truss Active Control Experiment has been conducted as part of the Large Space Structures Technology Program to address modeling and active vibration damping issues on a representative laboratory-scale model of future large flexible space structures. Our objectives, as part of the 12-Meter Truss Active Control Experiment, have been to identify several controller design techniques for active vibration damping, to examine these techniques via simulation studies, and to implement a number of the designs on the 12-meter truss. This report describes experiment, modeling, and the design and testing of several control approaches on the 12-meter truss. GRA

MEASUREMENT OF THREE-DIMENSIONAL CRACK TIP DEFORMATION BY DIGITAL IMAGE PROCESSING Ph.D. Thesis
Perng-Fei Luo 1992 209 p
Avail: Univ. Microfilms Order No. DA9239062

Based on a pinhole camera model, camera model equations, which account for the radial lens distortion, are used to map three-dimensional (3D) world coordinates to two-dimensional (2D) computer image coordinates by the use of camera intrinsic and extrinsic parameters. Using two cameras to form a stereo vision and applying 2D digital image correlation techniques, the 3D information can be obtained. To achieve this, a camera calibration technique was developed to obtain the optimal intrinsic and extrinsic camera parameters for each camera. Such stereo imaging system was used to measure both in-plane and out-of-plane displacement fields around the crack tip of fracture specimens made of Aluminum 6061-T6 and 304L stainless steel. To compare with the available two-dimensional theory of fracture mechanics, the measured displacement fields expressed in the world coordinate were converted, through coordinate transformations, to the displacement fields expressed in the specimen crack tip coordinates. By using a smoothing technique, the in-plane displacement components were smoothed and the total strains were obtained. To better understand the trend of the displacement field, rigid body motion was eliminated from the smooth in-plane displacement components and unsmoothed out-of-plane displacements. Results were compared with theoretical elastic and elastic-plastic fields. A K(sub I) field was detected for the Al specimen, but no HRR field was found. For 304L, a K(sub I) field was observed at lower loadings and an apparent HRR field was obtained at larger loadings. The two-dimensional J integral calculated using the experimentally determined in-plane displacements is path independent for each material. The J integral values for the aluminum specimen are close to the results obtained from both Merkle-Corten's formula and the EPRI report, but are 30 to 50 percent lower than the results obtained from the EPRI report for the stainless steel specimen. Dissert. Abstr.

CHAOTIC VIBRATIONS OF TUBES WITH NONLINEAR SUPPORTS IN CROSSFLOW
Y. Cai and S. S. Chen 1992 31 p Presented at the Winter Annual Meeting of the American Society of Mechanical Engineers (ASME), Anaheim, CA, 8-13 Nov. 1992
(Contract W-31-109-eng-38)
(DE93-004247; ANL/CP-75489; CONF-921110-43) Avail: CASI HC A03/MF A01

By means of the unsteady flow theory and a bilinear mathematical model, a theoretical study is presented for chaotic vibrations associated with the fluid-elastic instability of nonlinearly supported tubes in a crossflow. A series of effective tools, including phase portraits, power spectral density, Poincare maps, Lyapunov exponent, fractal dimension, and bifurcation diagrams, are utilized to distinguish periodic and chaotic motions when the tubes vibrate in the instability region. Results show periodic and chaotic motions in the region corresponding to the fluid damping controlled instability. Nonlinear supports, with symmetric or asymmetric gaps, significantly affect the distributions of periodic, quasiperiodic and chaotic motions of the tube with various flow velocity in the instability region of the TSP (tube-support-plate) inactive mode. DAMAGE EVALUATION OF STRUCTURES USING FREQUENCIES AND MODE SHAPES EXTRACTED FROM LASER INTERFEROMETRY Final Report, Sep. 1989 - Aug. 1992
Roberto A. Osegueda Nov. 1992 12 p
(Contract DAAL03-89-G-0104)
(AD-A260119; ARO-27260.9-EG-SAH) Avail: CASI HC A03/MF A01

Nondestructive damage evaluation theories to detect, locate and quantify damage in structures from vibrational characteristic measurements are summarized. Modal analysis experiments were conducted on cantilever beams and suspended plates using a laser interferometer vibration pattern imager. Resonant frequencies and mode shapes measured before and after damage were used to assess the inflicted damage. Three theories of damage detection were tested with the experimental measurements. It was found that the exact eigenvalue sensitivity method, which relates changes in eigenvalues and mode shapes to damage parameters, worked well in detecting the damage after an analytical model of the undamaged system was identified. However, the method was very sensitive to errors in the mode shape measurements. A method based on sensitivity of damage to eigenvectors required measurements of small changes of eigenvectors and was not proven. A modal strain energy approach, which culminated in an expression relating changes in thickness to changes in modal curvatures, is also summarized. Modal curvatures were obtained through curve-fitting and smoothing techniques. This method worked very well for cantilever beams but fail to conclusively detect damage in plates. GRA

surf3d: A 3-D FINITE-ELEMENT PROGRAM FOR THE ANALYSIS OF SURFACE AND CORNER CRACKS IN SOLIDS SUBJECTED TO MODE-1 LOADINGS
I. S. Raju (Analytical Services and Materials, Inc., Hampton, VA.) and J. C. Newman, Jr. Feb. 1993 101 p
(RTOP 505-63-50-04)
(NASA-TM-107710; NAS 1.15:107710) Avail: CASI HC A06/MF A02

A computer program, surf3d, that uses the 3D finite-element method to calculate the stress-intensity factors for surface, corner, and embedded cracks in finite-thickness plates with and without circular holes, was developed. The cracks are assumed to be either elliptic or part eliptic in shape. The computer program uses eight-noded hexahedral elements to model the solid. The program uses a skyline storage and solver. The stress-intensity factors are evaluated using the force method, the crack-opening displacement method, and the 3-D virtual crack closure methods. In the manual the input to and the output of the surf3d program are described. This manual also demonstrates the use of the program and describes the calculation of the stress-intensity factors. Several examples with sample data files are included with the manual. To facilitate modeling of the user's crack configuration and loading, a companion program (a preprocessor program) that generates the data for the surf3d called gensurf was also developed. The gensurf program is a three dimensional mesh generator program that requires minimal input and that builds a complete data file for surf3d. The program surf3d is operational on Unix machines such as CRAY Y-MP, CRAY-2, and Convex C-220. Author

SOLVING MODAL EQUATIONS OF MOTION WITH INITIAL CONDITIONS USING MSC/NASTRAN DMAP. PART 1: IMPLEMENTING EXACT MODE SUPERPOSITION
Ayman A. Abdallah (Analex Corp., Brook Park, OH.), Alan R. Barnett (Analex Corp., Brook Park, OH.), Omar M. Ibrahim (Analex Corp., Brook Park, OH.), and Richard T. Manella May 1993 14 p Presented at the 1993 MSC/NASTRAN World Users' Conference, Arlington, VA, May 1993; sponsored by the MacNeal-Schwendler Corp.
(NASA-TM-106063; E-7669; NAS 1.15:106063) Avail: CASI HC A03/MF A01

Within the MSC/NASTRAN DMAP (Direct Matrix Abstraction Program) module TRD1, solving physical (coupled) or modal (uncoupled) transient equations of motion is performed using the Newmark-Beta or mode superposition algorithms, respectively. For equations of motion with initial conditions, only the Newmark-Beta integration routine has been available in MSC/NASTRAN solution sequences for solving physical systems and in custom DMAP sequences or alters for solving modal systems. In some cases, one difficulty with using the Newmark-Beta method is that the process of selecting suitable integration time steps for obtaining acceptable results is lengthy. In addition, when very small step sizes are required, a large amount of time can be spent integrating the equations of motion. For certain aerospace applications, a significant time savings can be realized when the equations of motion are solved using an exact integration routine instead of the Newmark-Beta numerical algorithm. In order to solve modal equations of motion with initial conditions and take advantage of efficiencies gained when using uncoupled solution algorithms (like that within TRD1), an exact mode superposition method using MSC/NASTRAN DMAP has been developed and successfully implemented as an enhancement to an existing coupled loads methodology at the NASA Lewis Research Center. Author

SOLVING MODAL EQUATIONS OF MOTION WITH INITIAL CONDITIONS USING MSC/NASTRAN DMAP. PART 2: COUPLED VERSUS UNCOUPLED INTEGRATION

Alan R. Barnett (Analex Corp., Brook Park, OH.), Omar M. Ibrahim (Analex Corp., Brook Park, OH.), Ayman A. Abdallah (Analex Corp., Brook Park, OH.), and Timothy L. Sullivan May 1993 12 p Presented at the 1993 MSC World Users' Conference, Arlington, VA, May 1993; sponsored by the MacNeal-Schwendler Corp.

(NASA-TM-106064; E-7670; NAS 1.15:106064) Avail: CASI HC A03/MF A01

By utilizing MSC/NASTRAN DMAP (Direct Matrix Abstraction Program) in an existing NASA Lewis Research Center coupled loads methodology, solving modal equations of motion with initial conditions is possible using either coupled (Newmark-Beta) or uncoupled (exact mode superposition) integration available within module TRD1. Both the coupled and newly developed exact mode superposition methods have been used to perform transient analyses of various space systems. However, experience has shown that in most cases, significant time savings are realized when the equations of motion are integrated using the uncoupled solver instead of the coupled solver. Through the results of a real-world engineering analysis, advantages of using the exact mode superposition methodology are illustrated. Author

MAPPING METHODS FOR COMPUTATIONALLY EFFICIENT AND ACCURATE STRUCTURAL RELIABILITY

Michael C. Shiao (Sverdrup Technology, Inc., Brook Park, OH.) and Christos C. Chamis Oct. 1992 23 p Proposed for presentation at the 33rd Structures, Structural Dynamics and Materials Conference, Dallas, TX, 13-15 Apr. 1992 Previously announced in IAA as A92-34321

(RTOP 553-13-00)

(NASA-TM-105892; E-7359; NAS 1.15:105892) Avail: CASI HC A03/MF A01

Mapping methods are developed to improve the accuracy and efficiency of probabilistic structural analyses with coarse finite element meshes. The mapping methods consist of the following: (1) deterministic structural analyses with fine (convergent) finite element meshes; (2) probabilistic structural analyses with coarse finite element meshes; (3) the relationship between the probabilistic structural responses from the coarse and fine finite element meshes; and (4) a probabilistic mapping. The results show that the scatter in the probabilistic structural responses and structural reliability can be efficiently predicted using a coarse finite element model and proper mapping methods with good accuracy. Therefore, large structures can be efficiently analyzed probabilistically using finite element methods. Author (revised)

COMPUTATIONAL SIMULATION FOR CONCURRENT ENGINEERING OF AEROSPACE PROPULSION SYSTEMS

C. C. Chamis and S. N. Singhal (Sverdrup Technology, Inc., Brook Park, OH.) Feb. 1993 23 p Presented at the 1992 AIAA Aerospace Design Conference, Irvine, CA, 3-6 Feb. 1992 Previously announced in IAA as A92-33285

(RTOP 323-57-40)

(NASA-TM-106029; E-7592; NAS 1.15:106029) Avail: CASI HC A03/MF A01

Results are summarized for an investigation to assess the infrastructure available and the technology readiness in order to develop computational simulation methods/software for concurrent engineering. These results demonstrate that development of computational simulation methods for concurrent engineering is timely. Extensive infrastructure, in terms of multi-discipline simulation, component-specific simulation, system simulators, fabrication process simulation, and simulation of uncertainties--fundamental to develop such methods, is available. An approach is recommended which can be used to develop computational simulation methods for concurrent engineering of propulsion systems and systems in general. Benefits and issues needing early attention in the development are outlined. Author (revised)

A HIGHER-ORDER DIRECT BOUNDARY INTEGRAL-DISPLACEMENT DISCONTINUITY METHOD FOR FRACTURE PROPAGATION IN LAYERED ELASTIC MEDIA Ph.D. Thesis

Sakir Selcuk 1992 200 p

Avail: Univ. Microfilms Order No. DA9239154

This thesis presents the development of a direct boundary integral-displacement discontinuity method for plane-strain elastostatics boundary value problems in layered materials with cracks. Somigliana's identity for displacements inside an elastic region is extended to take account of crack-like geometries. The resulting boundary integral equations involve integrals with unknowns as the displacement discontinuities over the cracks. These equations are supplemented with traction boundary integral equations derived by differentiating the displacements. The kernel functions for the dual boundary integral equations are developed from the closed form solution to the problem of a concentrated force within one of two bonded half-planes in which the interface continuity conditions are fulfilled exactly. A four-layer elastic region with cracks is developed using a substructuring approach to construct one of the interfaces for the problem under consideration; the other two interfaces are automatically included by virtue of using the fundamental solution for the bonded half-planes. Quadratic variation boundary elements are used to model all boundary contours, cracks and the numerical interface. Crack tips are modeled with square-root variation boundary elements. All kernel-shape function products are integrated over straight-line boundary elements in closed form. Linear elastic mixed-mode fracture propagation criteria are reviewed and an algorithm based on the maximum circumferential tensile stress criterion is developed and incorporated into the numerical model for quasi-static crack propagation in layered materials. For cracks propagating away from a material interface, the criterion uses the linear elastic fracture mechanics solutions for stresses in the vicinity of a crack tip in a homogeneous region. The analytical solution for the stress field near the tip of an interfacial crack is used for the maximum tensile stress criterion to determine whether or not the crack will kink out of the interface. For cracks touching a material interface, the variation of the strength of the crack-tip stress singularity is not taken into account. Various example problems involving a circular hole and line cracks near or along material interfaces are used to compare the numerical results with the solutions available in the literature. Dissert. Abstr.

TWO-PARAMETER FRACTURE MECHANICS THEORY AND APPLICATIONS Interim Report

N. P. ODowd and C. F. Shih Nov. 1992 45 p

(Contract N00167-92-K-0038)

(AD-A259907; NUREG-CR-5958) Avail: CASI HC A03/MF A01

A family of self-similar fields provides the two parameters required to characterize the full range of high- and low-triaxiality crack tip states. The two parameters, J and Q, have distinct roles: J sets the size scale of the process zone over which large stresses and strains develop, while Q scales the near-tip stress distribution relative to a high triaxiality reference stress state. An immediate consequence of the theory is this: it is the toughness values over a range of crack tip constraint that fully characterize the material's fracture resistance. It is shown that Q provides a common scale for interpreting cleavage fracture and ductile tearing data thus allowing both failure modes to be incorporated in a single toughness locus. The evolution of Q, as plasticity progresses from small scale yielding to fully yielded conditions, was quantified for several crack geometries and for a wide range of material strain hardening properties. An indicator of the robustness of the J-Q fields is introduced; Q as a field parameter and as a pointwise measure of stress level is discussed. GRA

Damage and cyclic fatigue failure under alternating loading in

transformation-toughened zirconia ceramics is reviewed and compared to corresponding behavior under quasi-static loading (static fatigue). Current understanding of the role of transformation toughening in influencing cyclic fatigue-crack propagation behavior is examined based on studies which altered the extent of the tetragonal-to-monoclinic phase transformation in MG-PSZ through subeutectoid aging. These studies suggest that near-tip computations of the crack-driving force (in terms of the local stress intensity) can be used to predict crack-growth behavior under constant amplitude and variable-amplitude (spectrum) loading, using spatially resolved Raman spectroscopy to measure the extent of the transformation zones. In addition, results are reviewed which rationalize distinctions between the crack-growth behavior of preexisting, 'long' (greater than 2 mm), through-thickness cracks and naturally-occurring, 'small' (1 to 100 micron), surface cracks in terms of variations in crack-tip shielding with crack size. In the present study, the effect of grain size variations on crack-growth behavior under both monotonic (R-curve) and cyclic fatigue loading are examined. Such observations are used to speculate on the mechanisms associated with cyclic crack advance, involving such processes as alternating shear via transformation-band formation, cyclic modification of the degree of transformation toughening, and uncracked-ligament (or grain) bridging. BLADE ASSESSMENT FOR ICE IMPACT (BLASIM). USER'S MANUAL, VERSION 1.0

E. S. Reddy and G. H. Abumeri Apr. 1993 128 p

(Contract NAS3-25266; RTOP 505-62-OK)

(NASA-CR-191075; E-7733; NAS 1.26:191075) Avail: CASI HC A07/MF A02

The Blade Assessment Ice Impact (BLASIM) computer code can analyze solid, hollow, composite, and super hybrid blades. The solid blade is made up of a single material where hollow, composite, and super hybrid blades are constructed with prescribed composite layup. The properties of a composite blade can be specified by inputting one of two options: (1) individual ply properties, or (2) fiber/matrix combinations. When the second option is selected, BLASIM utilizes ICAN (Integrated Composite ANalyzer) to generate the temperature/moisture dependent ply properties of the composite blade. Two types of geometry input can be given: airfoil coordinates or NASTRAN type finite element model. These features increase the flexibility of the program. The user's manual provides sample cases to facilitate efficient use of the code while gaining familiarity. Author (revised)

USE OF THE CONVENTIONAL AND TANGENT DERIVATIVE BOUNDARY INTEGRAL EQUATIONS FOR THE SOLUTION OF PROBLEMS IN LINEAR ELASTICITY Ph.D. Thesis

Kuechler Muci and Karim Heinz 1992 151 p

Avail: Univ. Microfilms Order No. DA9302011

Regularized forms of the traction and tangent derivative boundary integral equations of elasticity are derived for the case of closed regions. The hypersingular and strongly singular integrals of the displacement gradient representation are regularized independently, through identities of the fundamental solution and its various derivatives, before the boundary integral equations are formed. Besides the displacements and the tractions, only the tangential derivatives of the displacements evaluated at the singular point appear in the regularized equations making them well suited for numerical treatment. The regularization of the hypersingular integrals demands that the displacement components have Holder continuous first derivatives at the singular point. Consistent with this requirement, the regularization of the strongly singular integrals is effective if the tractions and the unit vectors normal and tangent to the surface are continuous at that location. Higher order elements for two and three dimensional elastostatic problems are implemented through the coincident collocation of regularized forms of the displacement and the tangent derivative equations. The nodal values of the displacements, the fraction and their tangential derivatives are used as the degrees of freedom associated with the functional representative of the boundary variables. The tangential derivatives of the displacements and the tractions at the functional nodes are directly recovered from the boundary solution with comparable accuracy as the primative variables. Hence, the nodal values of the stress components are directly obtained through Hooke's law and need not be determined in a post processing manner. Several numerical examples demonstrate the advantages of the higher order elements versus the conventional ones. In two dimensions, four degrees of freedom per node Hermitian elements are used for functional interpolation only on those portions of the boundary where the gradients are high and quadratic Lagrangian elements are employed for the remaining parts of the modelled region. In three dimensions, nine degrees of freedom per node, incomplete quartic elements are employed for the approximation of the displacements and the tractions. Finally, the methodology presented here is general and can be extended to other problems amenable to a boundary integral formulation. Dissert. Abstr.

JOINT FLEXIBILITY EFFECTS ON THE DYNAMIC RESPONSE OF STRUCTURES. PART 1: DETERMINISTIC ANALYSIS Final Report

Luis E. Suarez and Enrique E. Matheu Dec. 1992 96 p

(Contract DAAL03-90-G-0214)

(AD-A260487; ARO-28374.5-EG-H) Avail: CASI HC A05/MF A01

The effect of the flexible connections on the dynamic behavior of structures was investigated. To take into account the uncertainties in their values, the stiffness of the connections are regarded as random variables. In the first part of the report, the problem is studied from a deterministic point of view in order to develop the analytical models and expressions required for a stochastic analysis. A bibliographic review of the deterministic analysis of structures with non-rigid joints and analysis of structures with random parameters is presented. A finite element model that includes the effect of the flexibility and finite size of the connections is formulated. By using a variational approach, it is shown that the mass matrix is also affected by the flexible connections. A sensitivity analysis is carried out to assess how the natural frequencies and modal shapes are affected by the variation in the stiffness of the joints. Closed form expressions to calculate the derivatives of the eigenvalues and eigenvectors are provided. GRA

The underlying purpose for the project is to improve the reliability and productivity of manufacturing processes that impart compressive residual stress (CRS). Recognizing that improvements in reliability, in particular, and productivity, in general, arise from development to effective and efficient process controls, one must first gain an understanding of the significant process parameters and their interactions. Thus, the specific aim of the project was to perform a state of the art survey assessment of CRS process parameters and control. Many of the findings of the survey focused on shot peening and other peening processes which are the most widely used of CRS processes; however, attention was given to many other CRS processes, including some for which CRS introduction is a process by-product and not the principal process aim. The report culminates in five recommendations for development work to be sponsored by the National Center for Manufacturing Sciences (NCMS) with intent to advance the state of the art in CRS processing. IMPROVED DYNAMIC STIFFNESS (SYSTEM MODELING), STATE-OF-THE-ART REVIEW

Apr. 1990 225 p Sponsored by National Center for Mfg. Sciences, Ann Arbor, MI

(PB93-127744; NCMS-88-PE-6) Copyright Avail: Issuing Activity

The report presents the results of work to assess the State of the Art of Dynamic Stiffness (System Modeling) as applied to machine tools and the machining process. The objectives of the project were to summarize current industrial practice and research activities, and identify needs and requirements for future efforts to improve the performance of machine tools in the area of dynamic stiffness. As the work progressed a pattern emerged and the study was organized into three major work areas: (1) dynamic system modeling of the machine tool structure; and (2) static and dynamic analysis of the combined machine tool structure/cutting process system (i.e., chatter prediction). Topics addressed included current analytical

and experimental methods, key case studies, leading researchers/institutions in the field, commercially available products, current practice, remaining technical problems, and future directions. GRA

ADAPTIVE HIERARCHIC MODELING OF PLATES AND SHELLS WITH A-POSTERIORI ERROR ESTIMATION Final Report
I. Babuska and Ch. Schwab Apr. 1992 31 p
(Contracts N00014-90-J-1030; F49620-92-J-0100)
(AD-A259941; BN-1133) Avail: CASI HC A03/MF A01

The problem of a-posteriori estimation of the modelling error and the adaptive modelling of plates is addressed in this paper. A family of models is proposed and upper and lower a-posteriori estimates of the modelling error in various norms are provided. The estimates are locally asymptotically exact. GRA

VARIATIONAL THEORY OF DEFORMATIONS OF CURVED, TWISTED, AND EXTENSIBLE ELASTIC RODS
Iradj G. Tadjbakhsh and Dimitris C. Lagoudas 18 Jan. 1993 18 p
(Contract DAAL03-92-G-0123)
(AD-A260331; ARO-30378.2-EG-URI) Avail: CASI HC A03/MF A01

The variational theory of three dimensional deformations of curved, twisted, and extensible elastic rods is obtained based entirely on the kinematical variables position and rotations. The constitutive relations that define the resistive couples and the axial force as gradients of the strain energy function are established. A candidate for the strain energy function on the basis of classical assumptions is presented. GRA

ON THE REGULARITY OF ELASTICITY PROBLEMS WITH PIECEWISE ANALYTIC DATA
B. Q. Guo and I. Babuska Jul. 1992 56 p
(Contract N00014-90-J-1030)
(AD-A260346; BN-1136) Avail: CASI HC A04/MF A01

This paper analyzes the regularity of plane elasticity problems with piecewise analytic data. The results are given in the frames of the countably weighted Sobolev spaces. These results are of major significance for the practical design and theoretical analysis of the p and h-p version of the finite element solutions of the elasticity problems. GRA

STUDIES IN PENETRATION MECHANICS Final Report
Romesh C. Batra Oct. 1992 160 p
(Contract DAAL03-89-K-0050)
(AD-A260436; ARO-26443.16-EG) Avail: CASI HC A08/MF A02

Steady state axisymmetric deformations of a thick thermoviscoplastic target being penetrated by a cylindrical penetrator also made of a thermoviscoplastic material have been studied. The materials of the target and the penetrator have been assumed to exhibit strain-rate hardening and thermal softening. In the second set of studies, the penetrator has been taken to be rigid, and the effect of friction at the target/penetrator interface, elasticity of the target material, and different flow rules used to model the target material have been analyzed. An engineering model capable of analyzing deformations of a viscoplastic target being penetrated by a rigid cylindrical rod has been developed. Various predictions from the model are found to match well with those from the finite element solution of the problem. GRA

COMPUTATION IN MECHANICS OF MATERIALS Final Report
R. J. Asaro, R. J. Clifton, and L. B. Freund 4 Jan. 1992 5 p
(AD-A260060) Avail: CASI HC A01/MF A01

The goal of this project, which was part of the DARPA Balanced Technology Initiative on Computational Mechanics, was to develop a comprehensive approach to the numerical modeling of the mechanical behavior of materials. Particular areas for focus in the project were the inelastic deformation of highly anisotropic materials such as single crystals and textured polycrystals, as well as evolving microstructural damage in ceramics and ductile metals in both slow and high rate deformation processes. While the contract was awarded for a period of four years, it was actually funded only for the first year plus a few months into the second year. Nonetheless, significant progress can be reported as a direct result of this project. GRA

CRACK DEFLECTION AT BI-MATERIAL INTERFACES
I. E. Reimanis, A. L. Graham, J. J. Petrovic, and D. L. Tullock 1992 10 p Presented at the Ceramic Science and Technology Congress and Exposition, San Francisco, CA, 1-4 Nov. 1992
(Contract W-7405-eng-36)
(DE93-003712; LA-UR-92-3885; CONF-921128-3) Avail: CASI HC A02/MF A01

Using the boundary element method (BEM), the effect of specimen geometry on crack deflection at interfaces is examined. We show that the results are nearly independent of specimen geometry for the case of a double-edged notch specimen. Our criteria agree well with recent criteria established analytically by He and Hutchinson (1992) for infinite specimen geometries; however, the results are dependent on the size of the crack length increments chosen for calculating the strain energy release rates. The implication is that the criteria depend on pre-existing flaws in the material. DOE

PROMISC USER MANUAL, APPENDIX 2 Final Technical Report (Diskette Supplement)
Lola Boyce, Jerome P. Keating, and Thomas B. Lovelace Jan. 1990 31 p Diskette supplement: IBM compatible 5.25-inch DSDD
(Grant NAG3-867)
(NASA-CR-192989; NAS 1.26:192989; NONP-Suppl-DK-93-159796) Avail: Issuing Activity (Center for AeroSpace Information) HC/DK A09

This user manual documents the FORTRAN program PROMISC. The program performs a multiple linear regression on actual experimental or simulated experimental data for as many as eighteen effects or primitive variables, yielding regression coefficients that are the empirical material constants, ai, required by PROMISS (see Section 2.0, Theoretical Background). Included in this user manual are details regarding the theoretical background of both PROMISS and PROMISC, input data instructions and sample problems illustrating the use of PROMISC. Appendix A gives information on the primitive variables, their symbols, FORTRAN names and both SI and U.S. Customary units. Appendix B includes a disk containing the actual input and output files corresponding to the sample problems. The source code is available from the author at the address

given on the cover page of this report. Appendix C details the IMSL, Version 10, subroutines and functions called by PROMISC. The PROMISC89 program is included on a floppy disk. Author

NONLINEAR DYNAMICS RESEARCH IN THE FORMER SOVIET UNION
H. D. I. Abarbanel, N. B. Abraham, A. M. Fraser, F. C. Moon, and E. A. Novikov Aug. 1992 216 p
(PB93-146496) Avail: CASI HC A10/MF A03

The report analyzes the capability in nonlinear dynamics research in the former Soviet Union. This is a broad area of research with implications in fields as diverse as cardiology, laser physics, oceanography, image processing, plasma dynamics, fluid physics, and population biology. Our focus was restricted to only a few topics in which the authors were able to bring together US experts in those fields. The areas of biological or medical applications, plasma physics, laboratory fluid dynamics, mathematical developments in integrable systems, and strength in mathematics are not treated in the report. INELASTIC NONUNIFORM TORSION OF STEEL I-BEAMS Research Report
G. Chen and N. S. Trahair Dec. 1991 37 p
(PB93-118776; R-647) Avail: CASI HC A03/MF A01

The paper presents a finite element model for analyzing the elastic-plastic nonuniform torsion behavior of thin-walled steel I-beams. The model uses Vlasov's warping strain model to represent warping torsion, and a mitre model for uniform torsion. The mitre model allows the representation at the tips of flanges of the transverse uniform torsion shear stresses. For elastic-plastic analysis, the incremental theory of plasticity is adopted, employing the Prandtl-Reuss flow rule and the von Mises yield criterion. The material state determination algorithm and the variable arc-length method are also employed to improve the accuracy and reliability of the solutions. The numerical integration over the cross section is carried out by dividing it into a number of triangular areas and then applying the no-bias area-coordinate Gaussian numerical integration scheme. The numerical examples provided show that good agreement is obtained with predictions of other models of inelastic nonuniform torsion and the experimental results by using the present finite element model. It is also concluded that the present model can predict more realistic results at higher rotations than other models which ignore the transverse uniform torsion shear stresses. GRA

In the field of viscoelastic dampers, a new strut design comprises a viscoelastic material sandwiched between multiple layers, some of which layers bear and dampen load force. In one embodiment, the layers are composite plies of opposing orientation. In another embodiment, the strut utilizes a viscoelastic layer sandwiched between V-shaped composite plies. In a third embodiment, a viscoelastic layer is sandwiched between sine-shaped plies. Strut strength is equal to or greater than conventional aluminum struts due to the unique high interlaminar shear ply design. Official Gazette of the U.S. Patent and Trademark Office

STRUCTURAL IMPACT SIMULATION USING PROGRAM KRASH
J. C. Liaw, A. C. Walton, and J. C. Brown 1992 14 p Presented at International Conference on Emerging Technologies in Vehicle CAE and Structural Mechanics, Detroit, MI
(Cranfield-Aero-9010; SAE-900466; ISBN-1-871564441; ETN-93-93552)
Avail: CASI HC A03/MF A01; Cranfield Institute of Technology, Coll. of Aeronautics, Cranfield, Bedford MK43 OAL, England, HC

Use is made of the KRASH program to simulate a simplified car into barrier impact. The objectives are: to outline an approach to the simulation of vehicle structural impact dynamics through the use of a simplified frontal impact model; to identify, through the use of the model, structural features which determine the crash behavior of a car in a frontal barrier impact; to identify current limitations of the approach; and to outline future improvements. A step by step modeling technique is illustrated whose application at an early stage in the design process, allows an understanding of the contribution of individual components to the overall crash performance of a vehicle. The Earth environment is getting worse due to the expansion of the activity of human beings. In order to resolve environment problems, it is necessary to monitor environment globally and continuously from space by earth observation satellites. NASDA (National Space Development Agency of Japan) is a leading agency for sea surface temperature and polar ice extent among several ISY (International Space Year) projects. NASDA is also contributing to the other projects such as vegetation. In this paper, types and format of MOS-1 (Marine Observation Satellite-1)/MOS-1b (Marine Observation Satellite-1b) data sets are reported and some evaluation results and future environment data sets are described. OBSERVATION SYSTEM FOR SEA SURFACE TEMPERATURE VALIDATION TEST IN MUTSU BAY
Ryuzou Yokoyama, Sumio Tanba, Takashi Souma, Hironori Maejima, and Korehiro Maeda *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 55-67 Prepared in cooperation with National Space Development Agency, Saitama, Japan (For primary document see N93-22119 08-43)
Avail: CASI HC A03/MF A03

An accuracy validation test project for the Sea Surface Temperature (SST) estimation by satellite data is undertaking in Mutsu Bay. The sea and air truth data are provided by the following four observation systems operated by independent organizations: (1) Mutsu Bay Automatic Buoy System (MBABS); (2) Automatic Meteorological Data Acquisition System (AMeDAS); (3) Sea Surface Temperature Profiler Buoy (SSTPB); and (4) Radio Sonde Observation System (RSOS). The satellite SST is combined with the sea truth SST by MBABS to form match-ups for the validation test. Their temporal and spatial coincidences are guaranteed to be within 30 minutes and one pixel resolution, respectively. The data of AMeDAS, SSTPB and RSOS can be effectively referred in the error analysis of the SST estimation. Author (NASDA)

MONITORING OF KUROSHIO CURRENT USING THE DATA OF VTIR OBTAINED BY MOS-1 AND MOS-1b Abstract Only
Hiroaki Ochiai *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 69-71 (For primary document see N93-22119 08-43)
Avail: CASI HC A01/MF A03

Kuroshio current, the most big scale warm current in the world, flows towards the north east direction along the southern coast of Kyushu, Shikoku and Honshu Island of Japan in normal conditions. But, when cold water mass is formed in a big scale by up-welling in the Sea of Kumano or Enshu, the flow pattern of Kuroshio current changes to a meandering pattern influenced by cold water mass and the environmental condition of the Sea of Kumano or Enshu in coastal areas became quite different from that when the Kuroshio current's flow pattern is normal. In this study, monitor of the flow pattern of Kuroshio current and ebb current are tried using the VTIR (Visible and Thermal Infrared Radiometer) data obtained by MOS-1 (Marine Observation Satellite-1) and MOS-1b (Marine Observation Satellite-1b), and several remarkable results are carried out. Although the resolution of VTIR is less than that of NOAA AVHRR (Advanced Very High Resolution Radiometer), it is recognized to be very effective to monitor the flow pattern of Kuroshio current and its surrounding area through the year. Author (NASDA)

SEA SURFACE TEMPERATURE: OBSERVATION IN OFF-SHORE OF SANRIKU

Denzo Inagake and Akira Tomosada *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 73-81 (For primary document see N93-22119 08-43)

Avail: CASI HC A02/MF A03

Satellite infrared sensors can detect a lot of small scale phenomena at the sea surface such as streamers, frontal eddies and the others, which cannot be found out by ordinary hydrographic surveys. But there remains some issues whether all of these phenomena are real ones, because the satellite sensors observe just the sea surface where the air-sea interaction is very active. It is necessary to distinguish what kind of phenomena are real ones or only illusions. On May 15, 1989, a warm streamer around the Kuroshio warm-core ring was visible in a NOAA-10 AVHRR (Advanced Very High Resolution Radiometer) image. The warm streamer was observed by hydrographic survey on board the Research Vessel Souyou Maru during May 20-22, 1989. The warm streamer around the warm-core ring had a structure beyond 500 meters depth. Also another warm streamer was observed in the warm-core ring. In this paper,, the structure of the warm streamer from its generation to spiraling in the Kuroshio warm-core ring and the development using the MOS-1 (Marine Observation Satellite-1) VTIR (Visible and Thermal Infrared Radiometer) and NOAA AVHRR images are reported. OBSERVATION IN THE EAST CHINA SEA

Masataka Hishida *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 83-96 (For primary document see N93-22119 08-43)

Avail: CASI HC A03/MF A03

NOAA-AVHRR image data is very usefull to analyze the ocean state of the East China Sea (ECS). It is important to clarify SST distribution of ECS because of the complexity that exists in the current system of the Kuroshio and it's branch as for example the Tsushima warm current (TC), the Yellow Sea warm current (YSC), adding warm eddy, cool water intrusion and otherwise tidal current. Some oceanographical data like as current data using ADCP and Argos bouy, temperature data using XBT, CTD and surface water sampling were gathered by the survey vessel of Shoyo in the cruise of KER (Kuroshio Exploitation Research). Those data were compared with the AVHRR data. The separate area of TC and YSC from the Kuroshio were made a guess and cool eddy and intrusion recognized by these data. Author (NASDA)

ESTIMATION OF PARTIAL CLOUD COVER WITHIN A PIXEL

Kohei Arai *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 97-106 (For primary document see N93-22119 08-43)

Avail: CASI HC A02/MF A03

A comparative study on estimation of partial cloud cover within a pixel has been conducted for use of the pixels partially suffered from cloud cover in sea surface temperature estimation. The estimation accuracies derived from four methods, the method using a brightness temperature difference between 3.8 micrometer and 11 micrometer wave length channels of NOAA/AVHRR (Advanced Very High Resolution Radiometer) and three methods based upon inversion problem solving, were compared. The experimental results with NOAA/AVHRR and MOS-1 (Marine Observation Satellite-1)/VTIR (Visible and Thermal Infrared Radiometer) data show almost same estimation accuracy of around percent in terms of RMS (Root Mean Square) error in cloud cover estimation. Also from the experimental results with simulated data, it was found a relationship among an observation noise, mixing ratio and estimation accuracy in case for the variance of cloud was greater than that of the ocean. In such cases estimation accuracy decreases in accordance with increasing of cloud cover and observation noise. Non-linear maximum likelihood estimation which is one of the methods based on inversion problem solving shows a good estimation accuracy compared to the other methods. In particular in case for the number of classes which designated for proportion estimation (in this case two classes, cloud and the ocean) is greater than the number of channels, or dimensionality of the observation vector, non-linear maximum likelihood estimation is superior to the other methods based on the best linear estimation and least square method. ELIMINATION OF ABSORPTION EFFECT OF ATMOSPHERIC GASES AND STRATOSPHERIC AEROSOL BY COMBINED USE OF IR AND MICROWAVE DATA

Yozo Takayama *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 107-117 Prepared in cooperation with National Space Development Agency, Tokyo, Japan (For primary document see N93-22119 08-43)

Avail: CASI HC A02/MF A03

Simulation studies on deriving Sea Surface Temperature (SST) by combining use of IR (Infrared) data from Visible and Thermal Infrared Radiometer (VTIR) and two frequency channels data from Microwave Scanning Radiometer (MSR), both on board MOS-1 (Marine Observation Satellite-1), are presented. For estimating SST the dual frequency (23.8, 31.4 GHz) microwave channels data have the same capability as IR split window (11, 12 mm) technique to correct atmospheric absorption effect. Moreover in case of MOS-1 VTIR and MSR data, estimated SST is better by using MSR dual-frequency channels to correct atmospheric absorption than by using VTIR split window, because for correction of the absorption effect effective signal to noise ratio of VTIR split window which have relatively coarse quantization of brightness temperatures, is lesser than that of MSR dual-frequency. Further the microwave dual frequency technique is superior in correction for stratospheric aerosol absorption to the IR split window technique, because stratospheric aerosol little absorb the radiation from earth surface in the microwave frequencies regions, whereas VTIR split window channels affected by it. A method to derive SST by using single IR window channel and dual frequency channels of MSR is proposed to reduce stratospheric aerosol effect upon estimation of SST when dense stratospheric aerosol layer is formed after a big volcanic eruption.

OVERVIEW OF ACTIVITIES OF ISY PIE COMMITTEE

Fumihiko Nishio *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 121-138 (For primary document see N93-22119 08-43)

Avail: CASI HC A03/MF A03

An overview of the activities of the International Space Year (ISY) Working Group on Polar Ice Extent (PIE), one of the earth science and technology projects of the Space Agency Forum (SAF) on ISY, are presented. The following topics were discussed: (1) processes of the four meetings held since its inauguration in January 1990; (2) five research items for ISY and their details, data sources, research participant countries, etc. (real-time ice monitoring and possibility of forecast, global arctic and antarctic brightness temperature data sets, ice movement and sea ice thermodynamics, sea ice modeling, and assimilation and/or integration of data set); (3) the subject of ISY PIE workshop in Japan on 1993 will be

focused on results of sea ice and land ice studies by satellite data and special topics on the sea ice and oceanography on the Sea of Okhotsk; and (4) the chronological variation of sea ice extent on the Sea of Okhotsk and the sea surface temperature on the eastern equatorial Pacific Ocean which shows the correlation between sea ice extent on the Sea of Okhotsk and La Nina event (followed by El Nino) on the equatorial eastern Pacific. SEA ICE AND GLACIER IN THE ANTARCTIC FROM PASSIVE MICROWAVE OBSERVATION
Takashi Yamanouchi, Hiroshi Kanazawa, Makoto Wada, Sadao Kawaguchi, Fumihiko Nishio (Hokkaido Univ. of Education, Iwamizawa, Japan.), Kouhei Cho (Remote Sensing Technology Center, Tokyo, Japan.), and Korehiro Maeda (National Space Development Agency, Saitama, Japan.) *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 139-151 (For primary document see N93-22119 08-43)
Avail: CASI HC A03/MF A03

Data of MOS-1 (Marine Observation Satellite-1)/MOS-1b (Marine Observation Satellite-1b) have been acquired at Syowa Station by the Japanese Antarctic Research Expedition. From the data of Microwave Scanning Radiometer (MSR) of 23.8 and 31.4 GHz, many parameters are to be derived for the sea ice, firn covered glacier and ice sheet in the polar cryosphere, together with the atmospheric water vapor and cloud liquid water content over the ocean. For the polar firn over the ice sheet, microwave brightness temperature shows a large variation according to the physical temperature and firn properties. For the further quantitative discussion, it is needed to use emissivities calculated from the mean brightness temperature or vertical temperature profile within the firn layer. The data of airborne microwave observation were used to interpret satellite data and a clear relation to the accumulation rate was obtained, which had been explained by the snow grain size using radiative transfer model of the firn layer. It is found to be difficult from the low resolution satellite microwave data to describe the large variation of accumulation rate near the coast, ablation zone-blue ice zone, where the snow melting occurs in summer time and high accumulation belt. The airborne microwave observations are worth continuing to monitor the variation of high accumulation area. A plan for ISY (International Space Year) data sets for Polar Ice Extent based on MOS-1 data is proposed, which will be helpful for the analysis of sea ice and ice sheet surface. Author (NASDA)

DRIFTING ICE IN THE SEA OF OKHOTSK
Masaaki Aota and Fumihiko Nishio (Hokkaido Univ. of Education, Iwamizawa, Japan.) *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 153-159 (For primary document see N93-22119 08-43)
Avail: CASI HC A02/MF A03

An overview of the study on the drifting ice on the Sea of Okhotsk using satellite, aircraft, coastal radar data, and Multi Spectral Scanning Radiometer (MSSR) data is presented. Not only the extent of sea ice cover but the presence of polynyas and leads are significant to the energy budget of the ice covered ocean and the local and regional climate for changing atmospheric circulation. Data analysis of the distribution and movement of the drift ice off the Sea of Okhotsk coast of Hokkaido observed by the radar network established from 1966 to 1968 showed that the number of days in which sea ice is recognized on radar image was significantly correlated with the sea surface temperature on the equatorial eastern Pacific Ocean. The chronological variation of sea ice extent on the Sea of Okhotsk acquired by various methods such as satellites, aircraft, ships, coastal radars, and MSSR correlates with sea surface temperature anomaly on the eastern equatorial Pacific Ocean (La Nina and El Nino). OBSERVATION IN ARCTIC
Kiyoshi Hatakeyama *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 175-187 (For primary document see N93-22119 08-43)
Avail: CASI HC A03/MF A03

Japan Marine Science and Technology Center (JAMSTEC) initiated arctic study from 1991, and the first extensive observation was made in summer. And the part of this program is internationally going on with many overseas organizations. The goal of this study is to establish some phenomenological models of arctic ocean, atmosphere, and snow and ice to express and predict their variabilities. Some of them, for example, arctic sea ice model may well predict the green house effect of the earth, which is one of the greatest concerns to human beings. This project is a long term plan over a period of 20 years. The first phase five years, from 1991 to 1995, a general form using observation by ship, automatically station buoy, and satellite has been made up. Author (NASDA)

VEGETATION DISTRIBUTION OF SOUTH EAST ASIA Abstract Only
Shunji Murai, Yoshiaki Honda, Masataka Takagi, Teruyuki Ito, and Isao Abe *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 191-193 (For primary document see N93-22119 08-43)
Avail: CASI HC A01/MF A03

In South East Asia, ecosystem is changed by commercial logging or shifting cultivation. Accordingly, it is necessary to control the natural environmental condition. A current vegetation map is useful to plan prevention of ecosystem change. Therefore, it was attempted to examine vegetation distribution of South East Asia. A global vegetation map has been generated with NOAA GVI (Global Vegetation Index) data. However, it has low resolution and low accuracy to watch South East Asia. Therefore a MOS-1 (Marine Observation Satellite-1) MESSR (Multispectral Electronic Self-Scanning Radiometer) data, which has two advantages, i.e., the resolution is higher than NOAA and MOS-1 data is cheaper than other satellite data (LANDSAT TM (Thematic Mapper) or SPOT), was selected. The data is synthesized more than 300 images which are resampled to 10 sec mesh size. And the vegetation map is generated using NVI (Normalized Vegetation Index) value. Moreover the vegetation distribution of each country (Thailand, Cambodia, Laos, Vietnam) is examined. Author (NASDA)

MONITORING OF GROWTH ENVIRONMENT OF FOREST
Haruo Sawada *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 195-203 (For primary document see N93-22119 08-43)
Avail: CASI HC A02/MF A03

This study aims to apply the vegetation index for mapping and zoning the environmental condition of forest land using MOS (Marine Observation Satellite) MESSR (Multispectral Electronic Self-Scanning Radiometer) data. It is considered that the seasonal changes of the spectral reflectance from vegetation are the most important factor for evaluating the environmental conditions of forest growing. Several seasonal data were collected and used for this study for obtaining the phenological conditions of forest land from satellite remote sensing data. Especially, data of dry seasons were gathered and the changes of the Normalized Vegetation Index (NVI) derived from the MOS MESSR data in Thailand where typical seasonal tropical forests are dominant were analyzed. The NVI values change depending

upon their terrestrial positions and vegetation cover types. The summations of the NVI values is considered to indicate the length of the well vegetated period. The data of each pixel is influenced by the terrestrial environmental condition and vegetation differences. And the segmentation method is necessary for zoning the environmental conditions based on the hypothesis that the environmental conditions make the differences of vegetation types of the area. MOS-1 (Marine Observation Satellite-1) data are found effective for zoning the environmental conditions of vegetated area based on the NVI data, although it is still necessary to continue to collect the data and store them in the systematic data base system. INVESTIGATION OF THE SURFACE CONDITION IN TAKLIMAKAN DESERT

Kiyoshi Tsuchiya, Takashi Ishiyama (Chiba Univ., Japan.), and Shigehiko Sugihara (Institute of Physical and Chemical Research, Saitama, Japan.) *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 207-226 In ENGLISH and JAPANESE (For primary document see N93-22119 08-43)

Avail: CASI HC A03/MF A03

As a part of Japan China cooperative research project on the mechanism of desertification, in situ surveys and satellite data analysis were made for the Hotan and Akusu areas located in the southern part and on the northern border of Taklimakan Desert respectively. Following results are obtained through analysis of obtained data: (1) it is possible to classify desert, semi-desert and vegetated areas based on the available satellite data, however it is not easy to classify vegetation type and the desertified area in the several years. Addition of more high resolution satellite data together with development of analysis technique is necessary; (2) in Hotan area located in the southern part of the desert the daytime surface temperature reached as high as above 62 C in late September while it was 42 C in late October. Below the surface, soil temperature dropped sharply reaching 30 C and 20 C at 5 cm depth in late September and October respectively. Large radiation cooling was observed at night in late October reaching as low as 2 C at the ground surface; and (3) precipitable water (atmospheric water vapor content) around the Taklimakan desert in late October in 1990 was around mm with a fairly large variation in a few days. UPPER-AIR CIRCULATION SYSTEMS

Masami Tokuno *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 243-254 (For primary document see N93-22119 08-43)

Avail: CASI HC A03/MF A03

The imageries of 6.7 micrometers Water Vapor (WV) channel from NOAA/HIRS (High Resolution Infrared Sounder) (Channel 12) and MOS-1 (Marine Observation Satellite-1)/VTIR (Visible and Thermal Infrared Radiometer) (Channel 2) are studied for the analysis of upper-air circulation systems. The results indicate the availability of the patterns on WV imagery to analyze significant upper-air flow features associated with troughs and jet streams, and the capability of sequences of the HIRS/WV imageries to synoptic-scale analysis. These results suggest that the WV imageries from NOAA/HIRS and MOS-1/VTIR are useful for the analysis of upper-air circulation systems. Author (NASDA)

INTERANNUAL VARIATIONS OF SEA SURFACE WIND SPEED, WATER VAPOR RETRIEVED FROM SPECIAL SENSOR MICROWAVE/IMAGER: EL NINO/LA NINA COMPARISON

Akira Shibata *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 255-265 (For primary document see N93-22119 08-43)

Avail: CASI HC A02/MF A03

Column water vapor and surface wind speed retrieved from the data of Special Sensor Microwave/Imager (SSM/I) are validated by truth data of upper air observation and ocean buoy data. Interannual variations of column water vapor and surface wind speed are investigated by data sets of them from July 1987 through June 1990. Data sets of these SSM/I's geophysical parameters showed interannual variations concerning with El Nino and La Nina in the tropical Pacific Ocean. The reversed pattern of surface wind speed is also found in the Atlantic Ocean and Northern Pacific Ocean. Author (NASDA)

DATA SET FOR FISHERIES: WHY CAN FISHING GROUNDS BE MONITORED BY DATA SET OF MOS-1b VTIR

Hideo Tameishi, Osamu Honda, Toshiyuki Kouguti, Shin Fujita, and Katsuya Saitou *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 279-289 (For primary document see N93-22119 08-43)

Avail: CASI HC A02/MF A03

JAFIC (Japan Fisheries Information Service Center) makes the satellite aided oceanographic condition charts with NOAA AVHRR (Advanced Very High Resolution Radiometer) data and sends these charts to fishing vessels in ocean. Because, it is shown that the NOAA AVHRR data are applicable to fishing ground forecasting. The indexes of fishing ground forecasting are as follows: (1) the most favorable temperature range of a target fish; (2) an oceanographic environment such as warm/cold current, warm/cold eddy, front and intrusion of warm/cold water which is produced as a fisheries oceanographic chart by JAFIC; (3) ocean color which corresponds to distribution of phytoplankton, that is fray condition. However, the ocean color is not described in this article but for further study in future; and (4)

a discriminant prediction system of skipjack fishing ground formation developed by JAFIC using the NOAA AVHRR data (1982-1985.) The discriminant prediction formula is F = 0.32X(sub 1) + 0.36X(sub 2) + 0.88X(sub 3). Besides, the JAFIC applied these results to the data set imageries of MOS-1b (Marine Observation Satellite-1b) VTIR (Visible and Thermal Infrared Radiometer), and it was clarified the MOS-1b VTIR data set imageries is as useful as NOAA AVHRR imageries on fine day.

LASER DISC FOR EARTH ENVIRONMENT DATA SET Abstract Only **c82**

Haruhisa Shimoda and Toshibumi Sakata *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 293-295 (For primary document see N93-22119 08-43)
Avail: CASI HC A01/MF A03

Global change problems are one of the most critical problems for humankind. However, the actual state of the problem is not well known by public. The best way to enlighten them is to show images of global change taken from earth observation satellites. The goal of this project is to develop a data set of images taken from satellites, and let people (especially young students) to be aware of global change, to understand the state of the art of the earth, to be concerned with earth environmental monitoring activity and to contribute to preservation of global environment. Laser disc (video disc) was selected as a media of this data set, because it is widely spread and has the capability to show both still and moving images. The configuration of this data set is as follows: (1) history of earth observations; (2) earth observation satellite MOS-1 (Marine Observation Satellite-1); (3) international cooperation for global environmental monitoring; and (4) MOS-1 MESSR (Multispectral Electronic Self-Scanning Radiometer) images of Japan. Cooperating with NASDA (National Space Development Agency of Japan)/RESTEC (Remote Sensing Technology Center of Japan), Tokai University is preparing for editing of data set and laser disc installation in order to contribute to ISY (International Space Year) projects.

ENVIRONMENTAL DATA SETS IN CANADA **c82**

Michael J. Manore *In* NASDA, The Second International Conference on Japanese Earth Observation Programs: Proceedings of Pre ISY International Symposium 31 Jan. 1992 p 299-310 (For primary document see N93-22119 08-43)
Avail: CASI HC A03/MF A03

Because of its very large land mass, the collection of environmental data sets in Canada has historically been a difficult and expensive proposition. Responsibility for the compilation and maintenance of such data sets does not rest with a single body, but rather with a broad range of discipline-specific agencies in meteorology, forestry, oceanography, agriculture, geology, and topographic mapping. Only recently have the large number of environmental data bases in Canada been catalogued with an eye towards making the most valuable ones widely available for research purposes. Relating to the ISY (International Space Year), Canada is the leader of the exciting 'Global Change Encyclopedia' project which bring together a wide variety of regional and global data sets on CD-ROM for publicity and educational purposes. The first ESA ERS-1 is expected to be brought into an approximately circular Sun synchronized orbit in Spring 1991. The active and passive sensors for its main purpose of oceanic and sea ice observations are outlined. Changes of orbit to suit the mission are given. A graphical representation of the ground segment for data reception and processing is given. The mission management and control center is at ESOC (Darmstadt, Germany) and the central facility at ESRIN (Frascati, Italy) is the main user interface. The composition of the worldwide network of sensor data ground stations is outlined. Processing and Archiving Facilities (PAF's) are being set up in England, France, Italy and Germany, F.R. Duties of the German ground segment, which include the German PAF and the Antarctic reception station, are given. The site of the Antarctic station is depicted, with the reception range for ERS-1 and the SAR (Synthetic Aperture Radar) strips of an orbit configuration with a three day repetition cycle. It is emphasized that NOAA AVHRR (Advanced Very High Resolution Radiometer) will be received here. A preliminary list of ERS-1 data and ESA products is presented. ESA

The use of satellite remote sensing for GTZ (German association for technical cooperation) projects in cooperation with developing countries is described. The main application fields are hydrology, land utilization surveys, forestry, regional planning, integrated regional development in rural areas, erosion protection, cartography, and the struggle against desertification. Additional projects to establish and extend remote sensing institutions in various countries are described. Aspects related to the establishment of remote sensing institutions in developing countries are outlined: personnel availability, infrastructure provision, high quality equipment maintenance, and supply of consumables. Legal and financial considerations are mentioned. The particular development objectives mentioned are to ensure the supply of foodstuffs and the development of the rural areas while protecting the environment, particularly in terms of land utilization planning, afforestation, forestry activities and the prevention of erosion. ESA

EARTH SENSING DATA SERVICE

Dieter Gottschalk *In its* Proceedings of Sixth User Seminar of the German Remote Sensing Data Centre of the German Aerospace Research Establishment (DLR) Aug. 1992 p 22-23 Transl. into ENGLISH from Tagungsband: 6th Nutzerserinar des Deutschen Fernerkundungsdatenzentrums der DLR (Oberpfaffenhofen, Germany, DLR), Mar. 1990 p 27-30 Original language document was announced as N91-12995 (For primary document see N93-22436 08-43)

Avail: CASI HC A01/MF A01; original German version available from DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

The Earth sensing Data Service (EDS) has established a field of operation whose main objective is to distribute image data from operational Earth observation satellites in association with processing and preparation of the data product to suit practical applications and active support for the use of the product. EDS is therefore associated with the concept of a remote sensing association developed with DLR, and establishes the conditions necessary for the DLR objectives of transferring the data distribution duties to industry. EDS represents a further step in the direction of making some satellite Earth observation activities into a commercial operation. Thus development has commenced in the application field (value adding companies). The organization of data distribution in the private sector is outlined. Experience shows that large scale use depends critically on the user being informed of the possibilities and having easy and rapid access to the data. The tasks of EDS were correspondingly defined and its operations will serve these objectives. ESA

GEOLOGICAL APPLICATIONS OF SPACE SAR DATA

Manfred F. Buchroithner *In its* Proceedings of Sixth User Seminar of the German Remote Sensing Data Centre of the German Aerospace Research Establishment (DLR) Aug. 1992 p 27-31 Transl. into ENGLISH from Tagungsband: 6th Nutzerseminar des Deutschen Fernerkundungsdatenzentrums der DLR (Oberpfaffenhofen, Germany, DLR), Mar. 1990 p 35-40 Original language document was announced as N91-12996 (For primary document see N93-22436 08-43)

Avail: CASI HC A01/MF A01; original German version available from DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

The use of space SAR (Synthetic Aperture Radar) data for geological applications, particularly the possibility of exposures with variable angles of incidence and different frequencies and the geocoding technique of operational geometric product distortion removal, is discussed. Experience obtained with Seasat, SIR-A and SIR-B is to be used for SIR-C and ERS-1. The subdivisions of geocoding into ellipsoid and terrain corrections are described. The requirement for availability of radar orthographic images for high relief terrain work is discussed. The use of both geometrically uncorrected and geocoded images for analysis of geological lineaments is

discussed. The potential for the use of space SAR image data appears in both general geology and economic and technical geology: lithological and tectonic mapping, exploration of soil, gas, ore and industrial minerals and civil engineering roadway and site determination. So called secondary image products which, in addition to the geocoded images, also include stereo image pairs and multiparameter color combinations from them (and also perspective views) will make the usefulness of cosmic SAR data increasingly apparent in the future. ESA

GEOCODED PRODUCTS OF FUTURE RADAR SENSORS
Gunter Schreier *In its* Proceedings of Sixth User Seminar of the German Remote Sensing Data Centre of the German Aerospace Research Establishment (DLR) Aug. 1992 p 32-35 Transl. into ENGLISH from Tagungsband: 6th Nutzerseminar des Deutschen Fernerkundungsdatenzentrums der DLR (Oberpfaffenhofen, Germany, DLR), Mar. 1990 p 32-35 Original language document was announced as N91-12997 (For primary document see N93-22436 08-43)
Avail: CASI HC A01/MF A01; original German version available from DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

Fundamental concepts of 'georeferencing' and 'geocoding' in remote sensing satellite image analysis are given, and the requirements for geometrical/mapping accuracy and high product throughput in an operational environment, in particular for the case of SAR (Synthetic Aperture Radar), are addressed. An example of the latter, the image distortions in undulating terrain due to the side view geometry, which makes it necessary to use a Digital Elevation Model (DEM) of high resolution for geometrical corrections, is addressed. In order to process DEM data, it must currently be corrected, archived and geometrically resampled; quality control of the products similarly makes control and inspection points necessary and these must also be digitally archived and processed in a corresponding manner; the finished geocoded products are oriented on topographical maps which are also archived for reference purposes. In order to deal with all this data operationally, data banks are set up for DEM's, control points and topographical maps and these banks are already filled with data. As an example, digital altitude models for the area of Germany, F.R., and topographical maps to a scale of 1:50,000 for the whole of Central Europe are available. For the actual geocoding, two groups of products which differ in their geometrical accuracy, as a function of the availability of reference data, are distinguished: in the case of a Geocoded Ellipsoid Corrected (GEC) product, the surface of the Earth is approximately represented by a locally modified ellipsoid; in the case of a Geocoded Terrain Corrected (GTC) product, the position of each pixel is recalculated, because of the terrain distortions in SAR, by means of a digital altitude model. ESA

Details of the payload of the Japanese Earth sensing satellite MOS-1 (Marine Observation Satellite) including the MSSR (Multispectral Self Scanning Radiometer), the VTIR (Visible and Thermal Infrared Radiometer), and the MSR (Microwave Scanning Radiometer), are given. Products being offered are currently individual; combined products from data from more than one sensor or several scenes per magnetic tapes are under development. One VTIR scene contains 4 minutes of orbit data and covers an area of 1500 by 1574 km. One MSR product consists of a complete exposure strip of one reception station and covers a maximum area of 5000 by 317 km. ESA

VEGETATION INDEX FOR EUROPE
Matthias Eckardt and Wolfgang Tonn *In its* Proceedings of Sixth User Seminar of the German Remote Sensing Data Centre of the German Aerospace Research Establishment (DLR) Aug. 1992 p 38-42 Transl. into ENGLISH from Tagungsband: 6th Nutzerseminar des Deutschen Fernerkundungsdatenzentrums der DLR (Oberpfaffenhofen, Germany, DLR), Mar. 1990 p 47-52 Original language document was announced as N91-12999 (For primary document see N93-22436 08-43)
Avail: CASI HC A01/MF A01; original German version available from DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

The calculation of a Normalized Vegetation Index (NDVI) from NOAA AVHRR (Advanced Very High Resolution Radiometer) data using spectral channels 1 and 2 is reported. NOAA AVHRR data are useful for land surface properties of importance in global and mesoscale climatic models because, in contrast to LANDSAT Thematic Mapper data, they offer daily flyover. Production of global vegetation index maps on the basis of global area coverage data is discussed. The channel spectral ranges are given. Absorption capabilities of the leaf pigments and the influence of the atmosphere are discussed. A diagram showing the annual variation of the NDVI over Central Europe for 1989 is given. Different vegetation forms cannot be distinguished unambiguously from the normalized vegetation index alone; it only produced a limited measure of the leaf surface index and/or the absolute biomass; it is, however, almost directly proportional to the absorbed photosynthetically active radiation. ESA

WATER SURFACE TEMPERATURES FROM SATELLITE THERMAL IMAGES
Peter L. Lobemeier *In its* Proceedings of Sixth User Seminar of the German Remote Sensing Data Centre of the German Aerospace Research Establishment (DLR) Aug. 1992 p 43-47 Transl. into ENGLISH from Tagungsband: 6th Nutzerseminar des Deutschen Fernerkundungsdatenzentrums der DLR (Oberpfaffenhofen, Germany, DLR), Mar. 1990 p 53-58 Original language document was announced as N91-13000 (For primary document see N93-22436 08-43)
Avail: CASI HC A01/MF A01; original German version available from DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

The preparation of area coverage data in water surface, wind and state of sea, by marine remote sensing, in order to produce and operate models of the oceanographic layers and sonar predictions, is reported. Weather satellites of the TIROS-N type routinely supply thermal images of the surface of the sea. The Planck radiation law determined the associated temperature for a black body from the radiation intensity in a wavelength band. Approximately 98 percent of the radiation measured in the 8.3 to 12.5 micron and is emitted by the surface of the water, i.e., water behaves approximately as a black body. Scatter on aerosols and absorption in the atmosphere reduce the radiation in the transmission path between the surface of the water and the satellite sensor. Water in the atmosphere (clouds) makes an additional contribution to the total radiation at the sensor. The measurement of the aerosol content of the air using lidar and determination of the temperature and humidity profile of the atmosphere using ratio probes are reported. In order to interpret thermal IR satellite pictures correctly, it is necessary to know the meteorological relationships in the area under investigation. Using exposures in the visible range, slick areas can be localized and these can be included in the interpretation of the spatial distribution of water surface temperature. ESA

DISTINGUISHING ICE THICKNESS FROM SEA ICE SURFACE SHAPE BY USING NOAA-AVHRR (NATIONAL OCEANIC AND ATMOSPHERE ADMINISTRATION ADVANCED VERY HIGH RESOLUTION RADIOMETER) AND SAR DATA
Christine Koenig *In its* Proceedings of Sixth User Seminar of the German Remote Sensing Data Centre of the German Aerospace Research Establishment (DLR) Aug. 1992 p 48-53 Transl. into ENGLISH from Tagungsband: 6th Nutzerseminar des Deutschen Fernerkundungsdatenzentrums der DLR (Oberpfaffenhofen, Germany, DLR), Mar. 1990 p 59-64 Original language document was announced as N91-13001 (For primary document see N93-22436 08-43)
Avail: CASI HC A02/MF A01; original German version available from

DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

NOAA AVHRR and SAR (Synthetic Aperture Radar) investigations, to establish an automatic classification method which would make it possible for ice formation services to recognize small scale ice structures and to undertake accurate geographical location of the sea, are reported. A few results sufficient to show that NOAA and active radar data complement one another in a profitable manner are described. Where NOAA records provided information on ice thicknesses and the moisture contents of the ice surfaces, ice fracture and ice compaction structures can be extracted from the radar scenes. The extent to which superimposing the two types of sensors provides an additional source of information is currently being investigated. It is, however, clear that the combined information makes it possible to distinguish pressure ridges from ship tracks. ESA

INVESTIGATIONS INTO THE DYNAMICS OF SEA ICE IN THE EAST GREENLAND SEA REGION IN MAY 1988, USING NOAA-AVHRR DATA

Stefan W. Dech *In its* Proceedings of Sixth User Seminar of the German Remote Sensing Data Centre of the German Aerospace Research Establishment (DLR) Aug. 1992 p 54-59 Transl. into ENGLISH from Tagungsband: 6th Nutzerseminar des Deutschen Fernerkundungsdatenzentrums der DLR (Oberpfaffenhofen, Germany, DLR), Mar. 1990 p 65-72 Original language document was announced as N91-13002 (For primary document see N93-22436 08-43)

Avail: CASI HC A02/MF A01; original German version available from DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

The use of NOAA AVHRR (Advanced Very High Resolution Radiometer) data to analyze the structure causing sea ice movements in the East Greenland Sea is reported. The movements of the sea ice were interactively extracted both by means of a statistical cross correlation method and by means of individual point tracking from a respective AVHRR channel 1 image pair. They were recorded in the form of ice flow displacement vectors. The satellite data had been previously calibrated and corrected for Sun level. From the vector fields obtained in this way, it is possible to determine the drift relationships and velocities of the drift ice regions in the area under investigation and to draw other important conclusions with respect to diverging or converging ice floes. Additional data was acquired in order to analyze the parameters influencing the ice drift. As an example, 173 aeriel photographs were produced along the edge of the ice in order to determine the ice surface morphology and two thematic mapper scenes were multispectrally processed near the solid ice region. In addition, three anchoring data sets were used to validate the flow and velocity of the East Greenland current. Meteorological information on wind direction and velocity on 500, 700, 850 and 1000 hPa and the pressure and the temperature distribution were taken from the analysis of the European Center for Medium Range Weather Forecast (ECMWF). Results produced from the analysis are given. Examples of images given are described.

THE USE OF REMOTE SENSING DATA IN A STATISTICAL GROUND UTILIZATION INFORMATION SYSTEM

Klaus Niemz *In its* Proceedings of Sixth User Seminar of the German Remote Sensing Data Centre of the German Aerospace Research Establishment (DLR) Aug. 1992 p 60-64 Transl. into ENGLISH from Tagungsband: 6th Nutzerseminar des Deutschen Fernerkundungsdatenzentrums der DLR (Oberpfaffenhofen, Germany, DLR), Mar. 1990 p 73-78 Original language document was announced as N91-13003 (For primary document see N93-22436 08-43)

Avail: CASI HC A01/MF A01; original German version available from DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

The STABIS data are collected and updated to suit the most varied types of user. In addition to the aerial photographs already evaluated on a test basis, the intention is to use more and more satellite images because of their known advantages in terms of interpretation. The main advantages of current satellite images are detailed, and the analysis of user requirements, the matching of the content of the satellite data, mathematical/statistical processing, and the interpretation to the results of this analysis, are reported. Conditions to be met by satellite images from the statistical point of view are discussed. Results of data preprocessing and associated results of classification of individual types of use are shown. Requirements for the STABIS are not yet realized. Whereas the mathematical/statistical methods such as the maximum likelihood method are proved, the classification procedure is still problematical. The accuracy of classification of satellite data (spectral information over different materials) for a statistical ground utilization system can only be assessed by means of a logical and feasible procedure. Whereas data interpretations are necessary for classification, interpretation for nonhomogeneous areas represents the only possibility of rapidly fulfilling the task of producing a statistical ground utilization system. The spectral classification (supplemented by pure interpretation) will make it possible to fill most of the STABIS catalog from remote sensing data and to keep it up to date. ESA

CLASSIFICATION OF TM DATA AS A CONTRIBUTION TO REMOTE SENSING FOR A HYDROLOGICAL RUN-OFF MODEL

Stefan Kleeschulte *In its* Proceedings of Sixth User Seminar of the German Remote Sensing Data Centre of the German Aerospace Research Establishment (DLR) Aug. 1992 p 65-69 Transl. into ENGLISH from Tagungsband: 6th Nutzerseminar des Deutschen Fernerkundungsdatenzentrums der DLR (Oberpfaffenhofen, Germany, DLR), Mar. 1990 p 79-84 Original language document was announced as N91-13004 (For primary document see N93-22436 08-43)

Avail: CASI HC A01/MF A01; original German version available from DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

Work on using TM (Thematic Mapper) remote sensing data in hydrology is reported. Land use mapping using TM data using subclasses of water, agricultural areas, grassland, forested areas, and urban areas, is discussed. The TR-20 precipitation/runoff model, which uses land use information, a digital terrain model, ground data, and precipitation data, is described. Results of the runoff simulation, are shown. The measured and calculated cases agree very well with respect to two most important high water characteristics, the peak runoff and the time when the peak flow occurs. Two forest damage scenarios produced using the data for this event are discussed. An increase in the high water danger when the average proportion of the forest damaged in the Rhineland Palatinate dies and is replaced by grass vegetation (50 percent damage) is shown. The '100 damage' characteristic is a scenario for the case where the whole of the forest in the catchment area dies. The consequences of forest death and other negative evironmental changes (for examples surface sealing) are an increase in the high water danger because the peak occurs earlier and the peak flow is higher. However, the indirect consequences, for example due to decreased infiltration, are also of great importance to the balance of nature on the long term. For this reason, simulation models are of great importance in water economy planning. For this purpose, however, such models require further development so that the data, which is already available in detail in terms of area (for example precipitation measurements with radar), can be also processed in detail in terms of area (by pixel).

SATELLITE IMAGE AND REFERENCE DATA INVESTIGATIONS FOR EXPLORATION PURPOSES

Dieter Schlichter *In its* Proceedings of Sixth User Seminar of the German Remote Sensing Data Centre of the German Aerospace Research Establishment (DLR) Aug. 1992 p 70-74 Transl. into ENGLISH from Tagungsband: 6th Nutzerseminar des Deutschen Fernerkundungsdatenzentrums der DLR (Oberpfaffenhofen, Germany, DLR), Mar. 1990 p 85-90 Original language document was announced as N91-13005 (For primary document see N93-22436 08-43)

Avail: CASI HC A01/MF A01; original German version available from DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

Investigation on methods for the exploration of concealed uranium deposits, using digital processing of remote sensing and other data, is reported. The principal objective was a substantially reproducible and rapid remote sensing method for mapping promising ore structures in the crystalline primary rock formation. A large part of the TM (Thematic Mapper) image processing involved texture investigations in addition to other processes. Therefore, an image processing law was sought for texture investigation

with those areas from which conclusions could be drawn about lithology and geology presented together or at least in such a manner that they can be clearly associated. A very promising law for this purpose is provided by bit plane division or manipulation. In this, a half tone image is divided into its bit planes which are then individually processed and subsequently transformed back, if necessary in a new order. Interesting results are discussed. ESA

THIRD STOKES PARAMETER EMISSION FROM A PERIODIC WATER SURFACE

J. T. Johnson, J. A. Kong, R. T. Shin, D. H. Staelin, K. ONeill (Army Cold Regions Research and Engineering Lab., Hanover, NH.), and A. Lohanick (Army Cold Regions Research and Engineering Lab., Hanover, NH.) 1991 35 p Sponsored in part by NSF

(Contract NAGw-1617; N00014-92-J-1616)

(NASA-CR-192334; NAS 1.26:192334) Avail: CASI HC A03/MF A01

An experiment in which the third Stokes parameter thermal emission from a periodic water surface was measured is documented. This parameter is shown to be related to the direction of periodicity of the periodic surface and to approach brightnesses of up to 30 K at X band for the surface used in the experiment. The surface actually analyzed was a 'two-layer' periodic surface; the theory of thermal emission from such a surface is derived and the theoretical results are found to be in good agreement with the experimental measurements. These results further the idea of using the third Stokes parameter emission as an indicator of wind direction over the ocean. Author

THEMATIC MAPPER LAND USE CLASSIFICATION AS A REMOTE SENSING CONTRIBUTION FOR HYDROLOGIC RUNOFF PREDICTION MODEL [THEMATIC-MAPPER-LANDNUTZUNGS-KLASSIFIKATION ALS BEITRAG DER FERNERKUNDUNG FUER EIN HYDROLOGISCHES ABFLUSSVORHERSAGEMODELL]

Stefan Kleeschulte (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Oberpfaffenhofen, Germany.) Sep. 1992 129 p Transl. into ENGLISH of Thematic-Mapper-Landnutzungs-Klassifikation als Beitrag der Fernerkundung fuer ein Hydrologisches Abflussvorhersagemodell (Oberpfaffenhofen, Germany, DLR), Mar. 1990 Original language document was announced as N91-12149

(ESA-TT-1238; DLR-FB-90-16; ETN-93-93514) Avail: CASI HC A07/MF A02; original German version available from DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

The use of remote sensing data covering large areas to elucidate spatially complex processes in hydrology is addressed. In particular, LANDSAT data is used to make an attempt to predict the runoff process in a small drainage area (200 sq km), using the relationship between land use and runoff. This is done by comparing measured hydrographs with those calculated for known precipitation events using the model. The LANDSAT system is reviewed, the Thematic Mapper mode of operation is described, and the study area and climatic conditions are presented. Digital image processing involves classification procedures, geometrical rectification, and a digital terrain model. In a further step, scenarios which represent possible future developments in the study area are elaborated. These scenarios are concerned with changes in runoff due to forest damage, the taking of agricultural lands out of use and urbanization effects. ESA

CALIBRATION, NAVIGATION, AND REGISTRATION OF MAMS DATA FOR FIFE

G. J. Jedlovec and R. J. Atkinson (General Electric Co., Huntsville, AL.) Feb. 1993 56 p

(NASA-CR-108397; NAS 1.15:108397) Avail: CASI HC A04/MF A01

The International Satellite Land Surface Climatology Project (ISLSCP) was conducted to study the interaction of the atmosphere with the land surface and the research problems associated with the interpretation of satellite data over the Earth's land surface. The experimental objectives of the First ISLSCP Field Experiment (FIFE) were the simultaneous acquisition of satellite, atmospheric, and surface data and to use these data to understand the processes controlling energy/mass exchange at the surface. The experiment site is a 15 x 15 km area southeast of Manhattan, Kansas, intersected by Interstate 70 and Kansas highway 177. The Konza Prairie portion is 5 x 5 km and is a controlled experiment site consisting primarily of native tall grass prairie vegetation. The remainder of the site is grazing and farm land with trees along creek beds that are scattered over the area. Airborne multispectral imagery from the Multispectral Atmospheric Mapping Sensor (MAMS) was collected over this region on two days during Intensive Field Campaign-1 (1FC-1) to study the time and space variability of remotely-sensed geophysical parameters. These datasets consist of multiple overflights covering about a 60-min period during late morning on June 4, 1987 and shortly after dark on the following day. Image data from each overpass were calibrated and Earth located with respect to each other using aircraft inertial navigation system parameters and ground control points. These were the first MAMS flights made with 10-bit thermal data. Author

INVESTIGATION OF THE APPLICABILITY OF REMOTE SENSING TECHNIQUES FOR ECOLOGICAL WATER QUALITY EVALUATION [ONDERZOEK NAAR DE TOEPASSINGSMOGELIJKHEDEN VAN ENKELE REMOTE SENSING TECHNIEKEN TEN BEHOEVE VAN ECOLOGISCHE WATERKWALITEITSBEOORDELING]

Feb. 1992 59 p In DUTCH Prepared in cooperation with Raadgevende Ingenieurs Witteveen en Bos, Delft, Netherlands

(BCRS-91-37; ISBN-90-5411-021-X; ETN-93-91885) Avail: CASI HC A04/MF A01

The applicability of two remote sensing techniques for the ecological evaluation of surface waters was investigated with a view to the stimulation of remote sensing in the Netherlands. The investigation of water quality using remote sensing is complex. Most techniques are not suited due to the location of spectral bands and the required radiometric sensitivity. The effect of atmospherics and seasons on the reflection is large and makes a generally valid interpretation difficult. Therefore, the determination of the ecological water quality using remote sensing is only a very limited success. ESA

IMAGE INTERPRETATION FOR LANDFORMS USING EXPERT SYSTEMS AND TERRAIN ANALYSIS Ph.D. Thesis

Abdullah Mohammed Al-Garni 1992 188 p

Avail: Univ. Microfilms Order No. DA9238119

Most current research in digital photogrammetry and computer vision concentrates on the early vision process: little research has been done on the late vision process. The late vision process in image interpretation contains descriptive knowledge and heuristic information which requires artificial intelligence (AI) in order for it to be modeled. This dissertation has introduced expert systems, as AI tools, and terrain analysis to the late vision process. This goal has been achieved by selecting and theorizing landforms as features for image interpretation. These features present a wide spectrum of knowledge that can furnish a good foundation for image interpretation processes. In this dissertation an EXpert system for LANdform interpretation using Terrain analysis (EXLANT) was developed. EXLANT can interpret the major landforms on earth. The system contains sample military and civilian consultations regarding site analysis and development. A learning mechanism was developed to accommodate necessary improvement for the data base due to the rapidly advancing and dynamically changing technology and knowledge. Many interface facilities and menu-driven screens were developed in the system to aid the users. Finally, the system has been tested and verified to be working properly.

Sponsored by Florida State DOT, and FHA, Tallahassee
(PB93-127090; FL/DOT/RMC-0397-2960) Avail: CASI HC A05/MF A01

An investigation was conducted to develop guidelines for performing and analyzing network adjustments of baseline measurements collected with Global Positioning System relative positioning techniques. Four second order class 1 geodetic control networks were established along transportation corridors according to the standards and specifications described by the Federal Geodetic Control Committee. Four Trimble 4000SX receivers were used to collect the data. Each of the four networks was adjusted independently on two different datums, NAD27 and NAD83. The results of the NAD83 adjustments showed station error ellipses that have semi-major axes ranging between 0.008 m and 0.090 m at the 95 percent level of confidence, and baseline precisions that range between 0.126 PPM and 13.096 PPM. The NAD27 adjustments showed error ellipses having semi-major axes that range between 0.023 m and 0.935 m at the 95 percent level of confidence and baseline precisions ranging between 1.315 PPM and 26.172 PPM. Some guidelines and recommendations for performing weighted least squares adjustments of GPS networks are provided. Author

USE OF COASTAL ZONE COLOR SCANNER IMAGERY TO IDENTIFY NEARSHORE OCEAN AREAS AFFECTED BY LAND-BASED POLLUTANTS Final Report
T. F. LaPointe and D. J. Basta Jan. 1981 29 p
(PB93-136604) Avail: CASI HC A03/MF A01

The purpose of the analysis was to use remotely sensed satellite imagery to determine the spatial boundaries of nearshore areas or zones likely to be affected by pollutants from land-based sources, so that data collected on the presence or absence of living marine resources could be combined with information on land-based pollutant discharges in a preliminary relative assessment of potential risk. Ocean zones of impact related to East Coast estuaries and embayments were approximated using reflectance patterns from data transmitted from the Coastal Zone Color Scanner (CZCS) instrument mounted on the NASA Nimbus-7 satellite. Data were transformed from numerical measures of radiance to photographic images suitable for identifying and mapping ocean impact zones through a simple enhancement technique. GRA

GROUND-BASED MICROWAVE RADIOMETRIC REMOTE SENSING OF THE TROPICAL ATMOSPHERE Ph.D. Thesis
Yong Han 1992 188 p
Avail: Univ. Microfilms Order No. DA9236836

A partially developed 9-channel ground-based microwave radiometer for the Department of Meteorology at Penn State was completed and tested. Complementary units were added, corrections to both hardware and software were made, and system software was corrected and upgraded. Measurements from this radiometer were used to infer tropospheric temperature, water vapor and cloud liquid water. The various weighting functions at each of the 9 channels were calculated and analyzed to estimate the sensitivities of the brightness temperatures to the desired atmospheric variables. The mathematical inversion problem, in a linear form, was viewed in terms of the theory of linear algebra. Several methods for solving the inversion problem were reviewed. Radiometric observations were conducted during the 1990 Tropical Cyclone Motion Experiment. The radiometer was installed on the island of Saipan in a tropical region. During this experiment, the radiometer was calibrated by using tipping curve and radiosonde data as well as measurements of the radiation from a blackbody absorber. A linear statistical method was first applied for the data inversion. The inversion coefficients in the equation were obtained using a large number of radiosonde profiles from Guam and a radiative transfer model. Retrievals were compared with those from local, Saipan, radiosonde measurements. Water vapor profiles, integrated water vapor, and integrated liquid water were retrieved successfully. For temperature profile retrievals, however, it was shown that the radiometric measurements with experimental noises added no more profile information to the inversion than that which was available from a climatological mean. Although successful retrievals of the geopotential heights were made, it was shown that they were determined mainly by the surface pressure measurements. The reasons why the radiometer did not contribute to the retrievals of temperature profiles and geopotential heights were discussed. A method was developed to derive the integrated water vapor and liquid water from combined radiometer and ceilometer measurements. Under certain assumptions, the cloud absorption coefficients and mean radiating temperature, used in the physical or statistical inversion equation, were determined from the measurements. It was shown that significant improvement on radiometric measurements of the integrated liquid water can be gained with this method. Dissert. Abstr.
